# INDEX TO THE FOURTH VOLUME.

- Accidental Division of the Flexor Tendon of the Hind Leg, perfect cure of, 373
- Address to the Landowners of England on agricultural distress and its remedy, 54
- Agriculture, prospects of, in 1836, 372
- Agriculture, application of steam to, 437
- Agriculture, French, 105
- Agriculture, state of, 100, 104, 214, 367
- Agriculture—the Tithe Question, 451
- Agriculture in East Lothian, 140
- Agricultural Distress, 63, 113, 119, 120, 130, 131, 184, 310, 339, 384
- Agricultural Distress, extracts from the Second Report of the Committee of the House of Commons on, 444, 460
- Agricultural Distress, relief of, 36, 350, 386, 448
- Agricultural Distress, large meeting of landholders and farmers in Somersetshire on, 30
- Agricultural Distress, adaptation of the currency to the relief of, 353
- Agricultural Intelligence, Fairs, &c. 77, 155, 232, 317, 398, 476
- Agricultural Meetings. — What must the farmers do? 44
- Agricultural Question, 142
- Agricultural Interest, 118
- Agricultural Reports, 74, 153, 233, 235, 313, 315, 395, 474
- AGRICULTURAL ASSOCIATIONS, 147 ; Bucks, 25 ; Rutland, 58 ; East Lothian, 381 ; Union, 387, Berkshire, 151 ; Gloucester, 38 ; West Somerset, 29 ; Kirkcaldy, 273 ; Isle of Sheppy, 121 ; East Riding, 180 ; Hereford, 236
- Agricultural Society, Central, 8, 36, 98, 121, 356
- Agricultural Societies, 472
- Allotment System, 112
- Alsike Clover (*Trifolium Hybridum*) account of, 296
- Animal Pathology, 445
- Arabians, his Majesty's, 427
- Australian Agricultural Company, 213
- Bees, management of, 297, 435
- Beet-root Sugar, and great increase of its manufacture in France, 102
- Beet-Root Company, 417
- Berwick-upon-Tweed — Exports, 149
- Bedfordshire, 264
- Bonded Wheat and Flour, 225
- Bone Manure, 293, 354, 411
- Bonded Corn, tricks practised for liberating, 455
- Brewing, 191
- Bricks, duty on, 349
- British produce and manufactures exported in 1834
- Case of acute founder in both fore feet, 230
- Cattle, North Devon, 256
- Cattle, on weeds in, 290
- Cattle, on the husk or hoose in, 18
- Cattle, palsy in, 200
- Carrier Pigeons, 473
- Cattle, rearing of, 469
- Cayley's, Mr. Letter to the Marquis of Chandos, 17
- Cloverseed, arrivals of Foreign, into London, Liverpool, and Hull, during the last six years, 106
- Corn Trade, Birmingham Annual Review of, 205
- Commerce, state of, 459
- Communication of Mr. William Blacker, 213
- Cows, results of the spaying of, 51
- Court of Common Pleas—a cheap horse, 152
- County Rates, 266
- Court of Exchequer, 231
- Corn, bonded, 37
- Corn Average, French, 152
- Corn Trade, review of the, 79, 158, 237, 319, 400, 429
- Crops, succession of, 417
- Copy of a letter addressed to the Chairman of the Cambridgeshire Farmer's Association, and of his reply, 56
- Central Tithe Association, 150
- Customs between Landlord and Tenant, and the incoming and outgoing Tenant, 391, 465
- Currency, 70
- Draining, 73, 128
- Draw Moss, 464
- Draining, thoughts on the extension of, 52
- Draining, thoughts on, as the speediest means of fertilizing the soil, 360
- Drilling, or depositing the seed in lines, 49
- Education and Crime, 126
- Early Œstrum, and Impregnation in a Heifer, 57
- Etiquette of the Field, 344
- Eskdalemuir, parish of, 370
- Extracts from a Russian Correspondent, 295
- Emigration, 381
- Exports from Hamburg in 1835, 106
- Example is better than precept, 108
- Fairs in Scotland, some account of the, 133
- Fallowing, 388
- For the Shrewsbury Chronicle, 384
- Flour Mills in America, 150
- Flour Mills at Rochester (United States of America) account of the, 375
- Fly in Turnips, effectual method of destroying the, 29
- Fruit, descriptions of several new varieties of, 170
- Grain, arrivals of, into the port of London for the last five years, 106
- Great Britain, Trade of, 382
- Hops, 43
- Hop Duties, 116
- Hops, annual amount of the old duty on, 417
- Hop-growers, health of, 375
- Hop-Merchants, important to, 312
- Horsemanship, 39, 107, 187, 267, 347
- Horses, remarks on the mode of breeding and its advantages, 61
- Horses, economizing food for, 208
- Horticulture — Asparagus, Sea-Kale, Rhubarb, Artichoke, 376
- Incendiarism, 230
- Irish Grain, comparative table, showing the relative value of it in London, Liverpool, and Glasgow, 193
- Irish Poor Enquiry, 455
- Ipswich Plough, 24
- Islington Market, 343, 387, 388, 459
- Landowners and the Corn Laws, 45
- Lambs, diseases of, 299

A DURHAM HEIFER,  
THE PROPERTY OF MR PEACH OF HAUGHTON, NORTHAMPTONSHIRE.

Exhibited at the Smithfield Show, 1835.

London, Published by J. Rogers, 48, Pall Mall, 1836.

# THE FARMER'S MAGAZINE.

JANUARY, 1836.

No. 1.]

[VOL. IV.

## THE PLATE.

THE DURHAM HEIFER, the subject of our Plate, was exhibited at the Smithfield Show on the 14th of December last. She was four years and eleven months old, and was fed on grass, turnips, and oil-cakes. She was the property of Mr. George Peach, of Great Haughton, near Northampton, who obtained the GOLD MEDAL for her as being "the Best Beast in any Class," and fifteen sovereigns as being "the Best Fat Heifer." A SILVER MEDAL was also adjudged to Mr. Dent, of Milton, near Northampton, as the breeder. This beautiful animal won three prizes, and was the subject of universal admiration.

### AGRICULTURAL DISTRESS.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—Although the subject of Agricultural Distress has been long sounding in the ears of the legislature, and throughout all classes of the people of this country, no sympathizing friend has yet appeared with a readiness and *ability* to give effectual and speedy relief! The subject has been so long complained of, and so often reiterated, that many persons regard it only as an old tale which would last for awhile and then die away. And the farmers are generally reproached as a *croaking set*, who will always cry out in time, and before they are hurt! This however, is but an ignorant and senseless affirmation, made for the most part by those who are fattening upon the spoils, and consuming the substance of the land which the farmer cultivates, without contributing any proportionate share of the burthens which the land has to bear.

The long continuance of the complaint, and the increase of the evil year after year, with no apparent prospect of better things at hand, seems at length to have produced conviction in the most sceptical on the subject, that *Agricultural Distress* does *really exist*, and that to an unparalleled extent in the nation! I say to an unparalleled extent, because, that former complaints were *real*, and obliged very many of the landed interest to create obligations, which are still undischarged, and in many instances are increased to such an amount as renders it almost, if not altogether hopeless that they will ever be able to repay them. And this is no *singular case* among agriculturists, but a very extensive one, and soon will, and must become extensively known, if things remain as they are.

How far the currency bill has produced this state of things, I will not undertake to prove. But this I do think, that when the currency was changed, the rate of interest on the debt of the nation, and also generally, ought in *justice* to have been reduced in the same proportion, as things became altered in value by that change. And unless this is done now, the obligations created by mortgage, &c., will never be discharged, and the moneyocracy will become the actual possessors of the nation. They are virtually so now, and are very fast swallowing up all.

But is this to be the *panacea* for *all the evil of Agricultural Distress*? No, Sir—the evil is complicated, and has been long coming on by a *combination* of causes, of which the currency bill may have been, and doubtless is one. The land is *surcharged* in a variety of ways.

There is the burthen of the poor—which bears in a very far greater proportion on the farmer than on any other class of people in the kingdom. In like manner, the highway, composition, and county rates; all which lie much heavier on the farmer than the proportion which in justice he ought to bear. And then there is that great state pauper the Church establishment, for the maintenance of which, that most oppressive, and unjust impost, the tithes, is levied and continued on the land, in a manner in which it ought never to have been imposed. There is a great outcry against the tithes in Ireland; but what are the tithes in Ireland compared with the burthen in England? The poor Catholics of the sister country are commiserated; but the poor Dissenters and farmers at home, may sink under the oppressive weight of the massive golden church establishment, with none to pity, or to help them! *Mr. Bather*, at the Shropshire Agricultural Society, exclaimed loudly against the landlords and farmers, as if they were the cause of their present distress, and had the remedy in their own hands! But why did not *Mr. Bather* descant a little upon the reverend and lay tithe eaters? Why ought the landlords and the farmers to accommodate themselves to their "*altered circumstances*," and the tithe eaters to *revel* in their luxuries, and receive their amount of composition as when the produce of the land was more than double its present price? How long will the landlords and farmers *sit still* and let the present tithe system *wrest* their property from their hands? How much longer are the tithe eaters to be allowed to *revel in the spoils* of the landlords and farmers, and to *impoverish* both the *land* and its *cultivators*, without contributing one mite, or risking any capital for the purchase of stock, or cultivation of the soil? A great portion of the land in the fen and marsh districts of the kingdom, has been rescued from the waters and made productive to the supply of the nation, in corn, cattle, &c.; at an *immense cost* for drains, banks, rivers, mills, &c. And then the *tithe* of the *produce* raised at all this cost and risk of the undertaking, (in many instances not less than 20l

an acre) goes to a *foreigner*, who like the drone in the hive, *consumes the honey*, but labours not to obtain it!

But, my Lord Darlington says, "the *clergyman must have his stipend*." Yes, the clergyman must feed and *indulge* himself in *luxuries and ease*, if the landlords and farmers *starve*! Why so tender of the tithe eaters, my lord? And why so hard upon the landlords and farmers, Mr. Bather? Let the clergyman have his *stipend*. But let it be according to the apostolic model, the voluntary offering of the people to the minister who preaches the Gospel to them—and not to a foreigner who sends his proxy to do the work, and pays him in many cases worse than a clerk's wages in a merchant's or an attorney's office. Let the clergyman however have his *stipend*. But let the *system of raising it be altered*. Let the *whole tithe system* be revised, and instead of *consuming the capital and industry expended* on the improvement of land; let it be the tenth of the *annual value* to the *landlord*; and then let the clergyman take his *moiety* only, and not the *whole* as now; and let the *poor* have their *moiety* also; and this will confer a *rational benefit*; and if the clergyman has not so *large* a stipend as he has now in many cases, the national religion will not suffer by it, and he will have much more than the primitive ministers of the Gospel had! Now if there be *one burthen* upon the *land*—*one* impost upon the *farmer*, which tends more to impoverish the soil, and to drain the pocket, and exhaust the resources of its cultivator, than another, surely, Sir, it is high time it was removed! And that the *tithe* is such a burthen, and unnatural impost, is allowed by the universal consent of all agricultural writers. Why not rouse from your apathy then, landlords and farmers, and from Johnny Groat's house to Land's End, make your voice to be heard, in seeking relief from this great, unnatural, and oppressive burthen?

I know it is hard to rouse you, and to bring you to a concentration of opinion upon this point; but dire *necessity* will in the end do it. You Sir, have once and again expressed your surprise at the *patience* with which this evil has been borne. *Farmers*, you know Sir, are a *rural* population; and that our habits and employments are *laborious, simple, and domestic*. And that it is much more difficult to bring a population so circumstanced to act in concert together, than the *dense* population of trading and manufacturing districts; who seem to derive a sort of *mechanism* from their employments, which they quickly bring into operation upon any point on which they are fixed.

Thus also it is with the tithe receivers, and great money lenders. They all act in concert, and seem all to have concerted together against the landed interest of the kingdom. Many are laid under obligation to tithe receivers for lenity shown them as to the time of payment; or for loans lent on mortgage, or otherwise; for they are *rich* as a body, and many of them great *money lenders*! Some have *family* connections by marriage, on hope of preferment to some good living for some part of their family, who have been brought up for the church; and the system is so interwoven with landlords and farmers, in a variety of ways, that it has become the great *Leviathan* of the nation. And to make head against it, is a hard thing! It has become a "*stranded Leviathan*" in Ireland, to use the phrase of Mr. Bather, and if it be suffered to remain *as it is*, in England, it will make landlords and farmers too, become stranded *Pignies*! In conclusion, Sir, I would say, seek an entire altera-

tion of the *tithe system* at home. Seek also a reduction in the interest of money, such as the alteration of the currency demands. Seek likewise poor laws for Ireland. Seek it in justice to Ireland, and for the sake of her almost starving peasantry; and seek it in justice to yourselves, that Ireland may *consume* more of her own produce at home.

I am, Sir, your constant reader, &c.  
A FARMER IN THE FENS OF CAMBRIDGESHIRE.  
Dec. 2.

NO. II.

## TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—I am a constant reader of your magazine, and look forward to each number with anxiety, hoping, according to the old adage of "Necessity being the Mother Invention," that in these necessitous times some one may find out some remedy, or at least kindle some well grounded hope of returning prosperity in the breasts of the despondent farmers; but alas! I turn over page after page, read speech after speech, and still little or no consolation do they afford me, except perhaps that the distress of the times is the means of developing such a character as that of the Marquis of Chandos, whose manliness, and zeal in the cause, far transcend my powers of eulogy. But, Sir, much as I admire his devotion to the cause, much as I feel grateful to him, still I cannot but think, that his advice to his constituents, not to sleep on their posts, but that as they have much to do they must instantly begin to act, and continue in one straight forward and constant course, that course being, to petition parliament to redress their grievances,—must only lead to disappointment. For, have not the speeches from the Throne, at the opening of the several past Sessions of Parliament, noticed and regretted the depressed state of the farmers, and recommended inquiry into the cause with the hopes of speedily relieving them? Had not the arguments of the Noble Marquis for the Repeal of the Malt Duty been unanswerably answered? Did not Lord Grey declare in the House of Lords that anxious as he was he knew of no means of relief but reduction of rent? Did not Lord Althorp declare, that beyond the New Poor Law Act, he could suggest none? Would Sir Robert Pill's Bill, for the equalization of local burdens, those which press upon the farmer, have been more than a flea bite compared to the distress? (Query? Mr. Editor), or can we expect much attention to such petitions when we read of one of the most talented of the present bunglers congratulating the country upon the improving state of the Agriculturists? No, Sir, I much fear, that it is out of the power of the legislature, interested as all its members must be, to afford any; and I may state this opinion with more confidence having it confirmed by the declaration of Lord Stanley at the Liverpool Agricultural Meeting. But I should not have troubled you with these remarks had I not a little pet plan, from which, I must confess, visionary as it may appear, I expect a great benefit to accrue, and that too speedily when taken up by the landlords and farmers of England. The Noble Marquis, in his preface to his toast of prosperity to the Royal Bucks Agricultural Association, uses these words:—"I confess, it is hard upon us, that of all the occupations of the state, Agriculture alone is depressed,—yes, the staple of the land is suffering, while all other branches of industry increase and prosper; it is not, believe me, of their prosperity that I com-

plain but of our adversity; and from the depression we must endeavour *to rid our ourselves*, if we would not sink under it." Better advice in my humble opinion could not have been given, or come from a higher quarter, and I sincerely wish that I could persuade the Noble Marquis, to agree with me as to the means of effecting so desirable a riddance. I would invite him to inquire with me into the cause of the unprecedented prosperity of the manufacturers at this moment, and to whom they are indebted for their prosperity; I think that we should find not to the liberality of a free trade Parliament, but solely to their own exertions; to the successful application of capital to their *machinery* by which they are enabled to undersell their neighbours, and consequently to command every market of the civilized world. And, Sir, why cannot we employ this power to rescue us from impending ruin, nay I will ask why do not we employ it, for I read in every provincial paper that Mr. Handley, M. P., I believe for one of the Divisions of Lincolnshire, stated at the Grantham Agricultural Meeting, having seen a steam-plough working in Lancashire, and turning up an acre of wet land, nine inches deep, in one hour and fifty minutes. Such power being therefore in existence I would beseech the Noble Marquis and every other landlord to inquire how far it would be desirable to employ it. Whether the making them in lieu of horses, which no human labour, *I believe* can make, would not afford much useful and profitable employment; whether the land which is now employed in keeping so many horses would not be more beneficially employed in feeding human beings, and whether the introduction of machinery for agricultural purposes would not produce moral effects almost I fancy incalculable. Mr. Herschell observes in his Discourse of Nat. Phil. "that the improvement effected in the condition of mankind by advances in Physical Sciences, as applied to the physical useful purposes of life, is very far from being limited to their direct consequences in the more abundant supply of our physical wants, and the increase of our comforts. Great as these benefits are, they are yet but steps to others of a still higher kind. \*\*\*\* The ideas once conceived and verified that great and noble ends are to be achieved, by which the condition of the whole human species shall be permanently bettered, by bringing into exercise a sufficient quantity of sober thought, and by a proper adaptation of means, is sufficient of itself to set us earnestly reflecting what ends are truly great and noble, either in themselves or as conducive to others of a still loftier character, because we are not now as heretofore hopeless of attaining them. It is not equally harmless and insignificant whether we are right or wrong; since we are no longer supinely and helplessly carried down the stream of events, but feel ourselves capable of buffeting at least with its waves, and perhaps of riding triumphantly over them; for why should we despair that the reason which has enabled us to subdue all nature to our purposes, should (if permitted and assisted by the providence of God) achieve a far more difficult conquest; and ultimately find some means of enabling mankind to bear down those obstacles which individual shortsightedness, selfishness, and passion, oppose to all improvements, and by which the highest hopes are continually blighted, and the fairest prospects marred." I dare scarcely trust any reflections of my own to stand contrasted with such as I have quoted, still I cannot quite check my pen from leading me into those fields of speculation in which

when restrained within the limits of reason, Mr. Herschel assures us, it is allowable to indulge. I cannot but contemplate that hearth which a waning fortune had been driving to despair, now made happy by the prospect of returning plenty, their dormant energies aroused; nor can I repress my fancy leading me to those hordes of self-banished families, whose courage has urged them to seek a home in savage climes, now animated with the hopes of once more seeing their native homes, for

They still have hopes, their long exertions past,  
Herc to return—and die at home at last.

Nor can I turn my fancy from those shores, where our extended commerce is offering her cheapened merchandise, is decomposing the hard rock of ignorance, and fitting it for the reception of the divine seed, the Word of God. My fancy knows no higher flight, I must therefore descend to reality and subscribe myself,

Yours, &c., &c.  
NEAR WREXHAM.

No. III.

#### TO THE EDITOR OF THE FARMER'S MAGAZINE.

Sir,—I have lately noticed in your Magazine accounts of several great meetings that have been held in different parts of the country for the purpose of considering the cause of the present distressed state of agriculture with a view to provide a remedy.

The meeting which it is my intention of noticing, however, is the one held at Shrewsbury, where the Earl of Darlington presided, as the speech which his lordship there delivered appears to me highly objectionable, as it tends to mystify a very plain subject, and to give rise to hopes that can never be realized.

His lordship commences by stating, that there were a great variety of opinions as to the cause of the distress under which agriculture now laboured, but that it was right to hear the opinions of all before they attempted to apply a remedy. He then proceeded to ask the all-important question, "What it was the farmers most complained of?" This was certainly a most necessary inquiry, and it was of the greatest importance to have it correctly answered, as before the seat of the disease was satisfactorily ascertained no remedy was likely to be applied with success; his lordship answered, and his audience acquiesced in the answer "low prices of produce." If the question has been correctly answered, it very naturally suggests another, what is the cause of the present low prices? This question is also answered by his lordship, "scarcity of money." Now let us inquire whether the low price of wheat, for example, is really caused by the scarcity of money, or whether it is not rather caused by the supply being greater than the demand, as the coming to a proper understanding on this point is of great importance, as scarcity of money affects the demand for wheat much less than any other commodity with which we are acquainted, it being, in the strictest sense of the term, a necessary of life.

I shall in the first place take it upon me to state, without the fear of contradiction, that there has been more wheat produced from the last three crops, and of course offered for sale, than ever there were at any former period in the history of Great

Britain in any three successive years; we have not only had three full crops, but the quantity of wheat now sown in most places double, and in a great many quadruple, within the last forty years, besides the immense and annually increasing quantities imported from Ireland: I admit the consumption is greatly increased, and that it never was greater than at present, as our manufacturers were never in a more prosperous condition; but this only goes to prove that the market is glutted, and that wheat must obey the laws of supply and demand like every other commodity. Why, for example, was oats last year so high-priced in proportion to wheat? Or, how does it happen that wool has been as dear for the last three years as ever it was during the war if money is so scarce? Was it not because the supply fell short of the demand?

Our next inquiry must be, what is the value of wheat? and what is the price we have a right to expect and calculate on for a series of years with average crops. This is a most important inquiry, and one which every agriculturist ought well to consider. Lord Darlington states that some were of opinion that the fall in prices was occasioned by the sudden transition from war to peace. "But," says his lordship, "that certainly might have accounted for it in the first year of peace, but not in the twenty-first." I differ from his lordship entirely; prices rose very much during the war on account of the extraordinary demand for grain; when that extraordinary demand ceased to exist, prices, as a matter of course, began gradually to fall back to their original level. All over Europe prices rose very considerably during the war, but they have again gradually receded to the level at which they stood ten years before the French revolution. Now for the ten years preceding 1789 the average price of wheat in England was about 45s per qr., what should prevent it again receding to the same point? prices may rise when the crop is deficient, but they may, and in all probability will, continue to fall below that point when we have a succession of good crops, as at present.

His lordship goes on to agree "that the war virtually ended in 1814. Granted, and prices fell after the crop of 1815 was reaped, because the crop was abundant, and the extraordinary demand had ceased. His lordship then states, "that 1817 and 18 were years of as great prosperity as the farmer ever knew, or could expect to know:" this I do not altogether admit, but I shall state matters as they really stood: 1816 was the most unproductive crop we have reaped, without exception, since 1799; of course prices were high, but then the farmer had little to sell; foreign could not be imported at that time till wheat reached 80s per qr; 1817 was only a degree better; at least I know in the northern part of the island the crop was very defective; prices of course kept high; the supply did not equal the demand: the crop of 1818 was good; prices kept up; stocks, being low, owing to the two preceding bad crops, until we were deluged with foreign corn in the summer of 1819; 1819, 20, 21, 22, were all good crops, the supply being fully equal to the demand; prices gradually fell till they reached the level at which they stood before the war; in the summer of 1823 it became evident that the crop was to be deficient, and prices began to rise rapidly in the month of June; the crop turned out bad, as was expected, and prices continued high; the crops of 1824 and 5 were good, and, as they succeeded a bad crop, we had full prices, as stocks had again got low; 1826

was the extraordinary dry year; winter-sown wheat was a good crop, but all others very deficient; prices for wheat continued fair; oats and barley were scarce and dear; 1827, 28, 29, 30, and 31 were all deficient crops, considerably below an average, and considerable quantities of foreign grain was required to supply the demand; prices continued proportionably high; 1832 was an average crop; 1833, 34, and 35 rather above an average; the supply is now greater than the demand, in consequence of an accumulation, particularly of wheat, and the present low prices are the consequence. I must therefore, after travelling over the same ground, as Lord Darlington, come to a different conclusion, as he is of opinion, that, "whenever money was plentiful prices were good, and when it was contracted prices were low." Now, I should say, whenever corn is scarce prices are good, and whenever it is plentiful prices are low.

If Lord Darlington's hypothesis is right, he may probably be pursuing a proper course in endeavouring to make money more plentiful if he possibly can, but if he is wrong, as I am very much convinced of, the altering the standard of value from gold to silver will have very little effect in relieving the agriculturist.

But, if 45s per qr is likely to be the average value of wheat—if, as Lord Darlington has stated, the cost of production cannot be reduced,—if tithes, poor-rates, and other local burdens which press on agriculture cannot be materially diminished,—if the altering the standard of value from gold to silver is likely to prove of none effect, what, then, is to be done? That is the question—Lord Darlington answers, alter the standard of value. So answer I—but not from gold to silver, but from gold to wheat, and this will, without doubt, give substantial relief to the agriculturists. I shall give an example how this alteration would work, and what amount of relief might be expected from it.

Lord Darlington read a statement of Lord Western's, in which he supposed, a farm of 100 acres, which, during the war, was let at 35s per acre, or 175*l*: the average of wheat from 1797 to 1819 was 80s per qr; the land, therefore, was let at the value of 3½ bushels of wheat per acre; 3½ bushels of wheat at present is worth 16s, which for the hundred acres would make 80*l* instead of 175*l*; this would make a difference on the rent of 95*l*; the labourers can't eat more bread or work more work than they did during the war; so if they get the same quantity of produce it is as much as they have any right to, and as much as the farmer can afford to give, the same with all other expenses. If Lord Darlington would introduce a motion to that effect in the House of Commons, and if the Marquis of Chandos and Mr. Cayley would have the goodness to support it, there is no calculating on what might be the consequence, but even if they failed they still might have the power of doing uncalculable good by taking payment of their rents in this way, and thus showing an example to the landowners in the kingdom, of liberality and justice.—I am, sir, your obedient servant,  
Q. E. D.

East Lothian, Dec. 3, 1835.

No. IV.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—Having heard that an Artist, has taken the likeness of the fat heifer, the property of Mr.

J. Mantly of Wolland, Devonshire, that won the first prize at the last cattle show, at Exeter, with the intention of having it prefixed in the next number of your valuable magazine, I am induced to trouble you with a few lines on the subject. The North Devon bullock is admired for its beautiful symmetry, as appears by the likeness above mentioned, the eye is very prominent, in truth it is without a fault as to shape, perhaps it may appear diminutive to a superficial observer, when compared with the Durham ox; but the Durham Goliath on a close examination will not appear so gigantic as one might imagine at first sight, the beauty of the Devon is that it is good in its *good* points. Mr. Mantly informs me, that he will produce more beef with the North Devon cattle from a certain quantity of ground, than any other breeder can with other breeds. The Devons will graze twenty pounds per quarter; I recollect seeing a few ribs of an ox killed by the Duke of Norfolk, that he purchased of Mr. Mantly that measured six inches of pure fat.

The old adage that "all is not gold that glitters" is not inapplicable to the North Devon breed of cattle, for many are sold, as of that breed, without any other pretension to the title than a red coat and a pair of horns; the Mantly's however are famed for having the breed in its purity; and what is most remarkable they have on every occasion that they have been exhibited gained a prize; they have not failed in one instance; such uninterrupted success denotes something *beyond the common*. Mr. F. Mantly, the uncle of James Mantly, has in his possession a cup awarded by the Bath Society for the best lot of neat cattle. Lord Somerville sold a pair of oxen that he purchased of Mr. Mantly, to King, who gained with them the first prize at Smithfield; so did another pair which the late Duke of Bedford sold to Gibblet. The uncle and nephew gained eight prizes last year at Exeter and *twelve* this year, a clear demonstration, that their stock is not of an ordinary sort. I shall not fatigue you with further details, their cattle need only to be seen and be admired. Saul the King of Israel, was, we are told taller by a head than any of his fellows; the Mantly's have certainly cogent reasons to be gratified on finding that their labours have not been in vain, though they do not wish to grow taller than their compeers.

The speech of Mr. Pyle of Tallaton, at the last Agricultural Meeting, at Exeter, appears to me, to be replete with sound sense, and gives one an idea of an independent yeoman; and it is to be hoped that landlords and tenants may profit by his advice—reciprocity of feeling, candour and openness in all matters between them will tend greatly to smooth the ruggedness of life with both, and above all, let Agriculturists unite in their efforts to make known their present difficulties, and their labours must ultimately be crowned with success.

Yours obediently,

DEVONIAN.

Devonshire,

## TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR.—As you give opinions on all sides of questions, I beg to offer, through the medium of your valuable publication, a few observations upon that much engrossing subject at the present moment, viz. the House of Commons taking into consideration the distress of the agricultural interest, with

a view to discovering the cause thereof, and applying a remedy.

It appears to me, Sir, that the cause is obvious enough and also the remedy; except in the instances where hungry cold clay soils, and other sterile tracts have been brought into cultivation by the exorbitant price of grain that once was attained: in these instances a complete remedy cannot be found without evident injury to the community generally, as it is impossible to keep such lands in cultivation but by keeping up the price of produce to an extravagantly high standard—endeavouring to continue that soil under the plough which a skilful and prudent cultivator would reject at no rent at all, if he could get tolerably good land to farm at a fair rate.

The supply of corn it is plain has now out-run the demand, and therefore the price has become low; it is not remunerating because the farmer cannot make sufficient with which to pay his rent. Then the cause of his distress is the high rent! Lower his rent and there is the remedy,—the natural and only rational remedy. Other things may be done, and much has been done by government to relieve the depression which has prevailed. Taxes to an immense amount have been taken off since the war which bore heavily upon the land: indeed not much more can be done in this way, except by a repeal of the malt tax, and that is impossible without providing a substitute, which substitute must be a property tax, the tax that landlords were so anxious to be relieved from, when before imposed, and which the two great parties, one of which must hold the reins of government most likely yet for a long time to come, unite in condemning, and if moved would undoubtedly unite in resisting, and that successfully. This however, I think ought to be done, to do away with the vexatious and injurious restrictions of the excise in the process of malting, and allow of the labourer brewing his own beer; though by no means am I of opinion that this step would of itself much relieve the distresses of the farmer generally, though it might do something. Yet this, with other means—as equalizing the land tax; commuting tithes; throwing the maintenance of the poor generally over the whole community, by a rate according to property, but administered locally under the directions of the poor law commissioners, with a less limited power to magistrates in urgent and particular cases than they possess by the poor law bill as at present in force, &c. &c. would do much; and the rest that is necessary, viz. reducing rents, must, in justice, be done by the possessors of the soil; those whose estates are clear can do it very easily, and as to the mortgagee who has perhaps almost as much interest to pay as he can obtain by rent, that is his misfortune, but as in the case of all other bad bargains he must bear it himself, and cannot justly expect that because he is so unpleasantly situated he has a right to demand of the legislature to adopt any and every means to support the price of produce, that he may still keep up his rents and preserve him from that reverse of fortune which any other speculator must inevitably submit to.

A change also in the currency appears a favourite remedy at this time with many. It does not appear to me that that would have any material effect: indeed, according to your table of prices of wheat, and amount of Bank of England notes in circulation at the same time at various periods, it would appear that the currency has almost nothing to do with the question; and to disturb the present apparently healthy regulation of the circu-

lating medium (for trade and manufactures it is acknowledged, on all hands, are thriving under it; and surely agriculture if it does not now feel the benefit of the thrift of these it must shortly?) for the purpose of satisfying some few speculative minds upon this point, would, it appears to me, be extremely unadvisable.

Already, perhaps, my letter has extended to too great a length, I shall therefore here terminate my remarks, and resuming the subject beg to trouble you again another day.

Strand Dec. 5 1835.

### CURING BACON.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

Sir,—The very large quantities of bacon which failed of being cured last year, has induced me to make the following observations, trusting they may be of use to those who are concerned in the curing of that valuable provision. The poor man who has by hard earnings, economy, and care, raised his pig for winter food, and has even deprived himself and his family of many necessaries of life, to procure food for it, in hopes of afterwards securing them substantial provision, is in general the sufferer; and the loss to him is incalculably more, than it is to a more opulent person; but the failure frequently manifests itself also amongst the farmers, as well as the poor; and I have heard of farmers who have had more or less bad, for twelve years successively! Some attribute this to a defect in the salt, and others to some peculiar pre-disposition in the flesh to putrify; but I am inclined, after some years of *unfailing* practice, and acting upon a principle which has been equally efficient for between thirty and forty years, to attribute the principal part of the failures of curing, to neglect. I have known bacon bad, while the hams which were bought and salted by another person were perfectly cured: which proves that it does not arise from any general pre-disposition to go wrong, and I have salted with salt, bought of a salter which did not fail to cure, while much of his own was bad, and quite unfit to use, which makes me think that the blame is not to be attached to the salt.

My plan is the following: The pigs are hungered at least twenty-four hours before they are killed,—thirty-six is perhaps better;—they are then killed as speedily as possible, and suffered to remain other twenty-four hours to cool. They are cut up, and conveyed to *lead* bowls, and having wiped salt over the swarth (skin) side with the hands, taking care to stop the salt and saltpetre into the "shank ends," in order that it may effectually reach the bone. The flesh side is then turned uppermost, covered with salt and sprinkled with saltpetre, (the proportions are for a twenty-stone pig, a stone of the former, and a pound of the latter); after laying about a week, the bacon is all removed; that which laid uppermost is put lowest, and more salt is added to those parts from which it may have disappeared. In about three weeks, or a month, it is fit to hang up to dry, and it has never in a single instance failed of being effectually cured. The circumstances which must especially be attended to, are the following: the pig must fast before it is killed; it relieves the vessels, which if loaded, would tend to putrefaction: it must be as little irritated as possible when killed, and the more speedily it is effected the better; humanity and interest alike demand it. Let it be thoroughly cool, before it is salted, and place it in

*lead* vessels, if at hand, but *do not rub it*; it only excites the putrefactive process, and you can never rub the salt *through the skin*. Stop the salt well into the "shank ends," and above all let the place be cool and airy, (much depends on this,) and remove it, and add salt as above directed, frequently. By attending to these precautions, I believe, uncured bacon will seldom occur, and if a single poor man's family have their bacon cured in consequence of these simple remarks, it will amply repay,—Sir, your obedient servant,  
Yorkshire.

A FRIEND OF THE POOR.

No. VII.

### TO THE EDITOR OF "THE FARMER'S MAGAZINE."

Sir,—Will you, or some of your intelligent correspondents, be so obliging as to inform an inexperienced farmer in these difficult times, by what rule the relative quantity of nutriment in tale wheat, oats, peas, malt dust, bran, &c. for feeding stock, can be ascertained? We all know that we can buy a large quantity for comparatively little money, as bran and malt dust for instance; while, at the same time, we may really be buying the dearest article relatively to the quantity of nutriment contained in them.

An answer in your next Magazine to this inquiry will greatly oblige, your's truly,

A HERTFORDSHIRE FARMER.

Dec. 9.

No. VIII.

### TO THE EDITOR OF "THE FARMER'S MAGAZINE."

Sir,—Being a subscriber to your valuable publication, I beg to ask two plain questions. What is become of the land-valuers who were employed by the whole of the proprietors some twenty-five or thirty years ago to double their rental? I beg further to ask of the tenantry of England, if those gentlemen or others have been over their farms to re-value within these last four or five years? I shall make only one remark—that agricultural produce has been at a low ebb for the last twenty years.—Yours, respectfully,

Dec. 11, 1835.

JUSTICE.

A SPORTING CHARACTER.—A wealthy old bachelor, of Jewish extraction, has lately settled in a noble mansion in the Queen's County. His habits are most eccentric. He lives in almost total seclusion, and in all his household expenses observes the strictest economy. The neighbouring gentry in vain offered him the advantages of their society. He would neither give nor take dinners, nor join in the usual amusements of the country. He does not patronize fox hounds, has little affection for beagles, a more than O'Connell antipathy to greyhounds; nevertheless, he is a sportsman, and keeps a pack of dogs, but they are bull dogs—enormous monsters, which he imported in a caravan, and keeps barred up in iron cages like the wild beasts in a menagerie. His main delight consists in feeding these beautiful pets with meat well cooked and carefully separated from the bones, lest any injury should befall their teeth. He also keeps a numerous establishment of game cocks, betwixt whom and the sweet creatures in the kennel all his parental cares and affections are divided. This genius is reported to be worth half a million of money.

## THE ADVANTAGE AND ECONOMY OF RAIN-WATER.

We are not aware of any article of common consumption which may be productive of more comforts to a family than rain-water. We do not take in view the blessing of water in the abstract; nor shall we enter upon any inquiry at present into the qualities of this apparently bland and simple fluid, which, however, contains within itself the elements of the most tremendous energy of combustion. Our object is to state a few facts connected with the subject of rain-water alone; and we hope to show, beyond the possibility of doubt, that, in domestic economy, it may be rendered of infinitely greater importance than has hitherto been believed.

It will be but just, however, to premise, that our remarks do not allude to anything absolutely new; there are many persons who are practically aware of that which we are about to suggest; our aim is simply to extend, not to originate, a practice, which we are sure is appreciated by all who have adopted it, and will be so, just in proportion as it shall become further known and understood.

Rain-water is valuable in every situation where it can be collected in sufficient abundance. In London, and in large towns, it is apt to be contaminated with soot; but from this and other impurities it can be freed by a process hereafter described. Wherever it can be obtained pure, or rendered so, it is water in the very best form. To the gardener it is all but indispensable; his plants can scarcely be in health without it; but every thing flourishes, particularly the beautiful gems of the parterre and flower-garden, if an ample supply of this gift of nature be at his command. The housewife and laundress are perhaps more indebted to it for their immediate comfort than any other persons, because of its great softness, and the facility which it consequently affords to the many important operations in which they may employ it. All other water contains a greater or less proportion of chemical solutions of lime which render them hard, or (to speak more correctly) tend to decompose soap, and to deposit that mineral matter upon the skin, which induces a roughness, at the least, if not a liability to chaps.

Rain-water is generally supposed to be unpleasant to the palate; if, however, it be carefully collected, in the first instance, and properly filtrated, it is found by experience to be the pleasantest water that can be drank. We were in the habit, some few years since, of visiting a family where the rain from the roofs was caused to pass through a canvass strainer, in texture like that of a cheese-cloth, into the water-but; there it deposited any impurities which were not caught by the cloth, and every day a few gallons were filtrated by one of the newly invented portable apparatus. The water was perfectly bright and pure; its flavour (if the term be admissible) was most delicious; in fact, it was the finest water we ever tasted, not even excepting that of pellucid mountain streams or the lakes. Nothing of the rapid insipidity of common rain-water remained, nor will that ever be perceived if the fluid be properly collected and strained.

We now come to the principal object of this paper, which is to direct the reader to a certain mode of collecting and preserving a large stock of this estimable gift of nature.

If this article meet the eye of a resident of that chalky but most fertile granary of the metropolis, the Isle of Thanet, at the north-east point of Kent, it will be sufficient to mention a rain-water tank, to insure his instant assent to our unqualified assertion, that a greater convenience can scarcely be attached to a homestead. In some parts of Berkshire also we shall

meet with approvers, because a few tanks are found there; but with the exception of the two districts above referred to, the real rain-water tank appears to be scarcely known. It is therefore our intention to urge the general adoption of a plan, which can be perfected at an expense trifling if compared with the great advantages it secures.

The reservoirs or tanks for rain-water are generally constructed of a cylindrical form, somewhat resembling a shallow well; they are sunk in the ground, and should be built, with the best bricks, nine inches in thickness. The brickwork will be rendered most secure if it be put together with the best Parker's cement; but good mortar, made up with two or three parts of finely sifted sea-coal ashes, and one part of the best lime (particularly that from thoroughly burnt limestone), will do extremely well. The internal surface must, however, be accurately and entirely covered with a coating of the cement, of at least one-third to one-half of an inch in thickness. From one thousand to five thousand gallons of rain-water may thus be collected, and secured from dirt and dust; and if the fluid, in passing into the reservoir, be made to run through a filter, prepared by putting into a deep tub a quantity of well washed sea or river sand, to the depth of a foot or more, over that a stratum of bruised good charcoal, and finally a layer of clean gravel stones, it will be effectually sweetened, and purified from all extraneous matters. This tub might either be bored at the bottom with an augur-hole, to let the water pass by means of a broad funnel into the tank, or be furnished with a false wooden bottom, pierced with holes; the intervening space would then be filled with water, which a common tap, passed through a stave just above the true bottom of the tub, could convey away into its under-ground recipient.

A tank, we have said, is built in the ground; the opening at top is always secured either with flat stones or with a brick arched dome, in the centre of which a stone is let in, and fitted in a groove. This stone is moveable, and is occasionally taken up when it is found needful to clean out the tank. But if the purifying filter were employed, the water would be so effectually cleansed, that little or no deposit could ever be formed, and it therefore would keep well for a very long period.

A few pounds would cover the first expense of a medium sized tank; and we believe that a sum under ten pounds in the whole, would also furnish it with a pump and pipe, by which this purified and salubrious water could be introduced into the dwelling, and be thus always ready to be applied to the several purposes of domestic economy, to which water, and particularly soft water, is so indispensably requisite.

Under common circumstances, nine-tenths of the rain-water which falls on every dwelling and its offices are wasted; by the plan suggested, a large portion of it would be saved, and be rendered available in the best and most advantageous manner.

CALCULATIONS IN FAVOUR OF RAILWAYS.—It has been correctly calculated from accurate statistical accounts, that the land required for the annual support of one horse is sufficient to maintain a family of eight persons; therefore, it must be evident to the meanest capacity, that, as the number of horses can be lessened, so will the quantity of subsistence for human beings be increased. Now let us suppose, that in the space of six years the services of 100,000 horses would be dispensed with, a calculation not exaggerated, the produce of such land, under cultivation, would be sufficient to nourish 800,000 persons more than are now enabled to procure the bare necessities of life.

## CENTRAL AGRICULTURAL SOCIETY.

A general meeting of deputations from the Local Agricultural Associations was held on Tuesday, Dec. 15, at the Freemasons' Tavern, Great Queen-street, for the purpose of forming a Grand Central Society, to be under the direction of a Board of Agriculture.

Soon after eleven o'clock between four and five hundred noblemen and gentlemen, members of the different deputations, assembled in the great room, William Ormsby Gore, Esq., M.P., in the chair.

The CHAIRMAN opened the business of the day by briefly stating the object for which they were met together, and he enforced on the meeting the absolute necessity of union among the agriculturists, whether landlords or tenants, throughout the empire, in order that they might obtain, by remedial measures on the part of the Legislature, complete relief from the severe pressure of that distress under which the agricultural interest was now suffering. A series of resolutions would be proposed to the meeting for consideration, and, if approved of, for adoption, with a view to the formation of a Central Agricultural Society in this metropolis. The Honourable Gentleman then called on Mr. Richard Spooner to move the first resolution.

Mr. R. SPOONER said it was known to all whom he had the honour of addressing, that public meetings of this sort could not be conducted without some previous preparation. Some few of the gentlemen who had been deputed from the different counties therefore met yesterday, and with great care and attention drew up some resolutions, having for their single and simple object the formation of a central association in London, for the protection of the agricultural interest of Great Britain. Their Honourable Chairman had stated, very forcibly and very properly, the necessity of union. He agreed with his Honourable Friend, that they ought to be united in opinion on the subject-matter of the resolutions which he should have the honour of proposing. No rational being could for one moment doubt the first assertion contained in these resolutions—namely, that the landed interest, and especially the laborious and meritorious tenants connected with that interest, were in a deeply depressed state, and that it was the first duty of Parliament, and of all parties, to endeavour to alter that condition, and to place it where the true interests of the country required it should be placed—upon a firm and stable footing of prosperity—that being the only firm and stable footing upon which the prosperity of all other classes could ultimately be founded. (*Cheers.*) Upon that question, he apprehended, there could be no difference of opinion. And, then, as to the necessity of forming a central association he likewise expected an equally unanimous determination, because he believed they were all perfectly well aware that hitherto the want of strength on the part of the landed interest was to be attributed to a want of union amongst them (*cheers*); to the want of a point of common concentration; and to their not being able to bring their rights, interests, and just claims before Parliament in a full, complete, and efficient way. (*Cheers.*) The resolutions he should have the honour to submit to the meeting would first declare the existence of agricultural distress; next, the necessity of forming a central association; and then they would deal with the several details which it would be necessary to adopt for the purpose of carrying the second resolution into full operation. The provisional committee, however, did not wish these resolutions to be adopted without consideration. On the contrary, the resolutions were quite open to

amendment, and the committee were ready to adopt any suggestion that might be made and approved of by the meeting. Before reading the resolutions, he must be allowed to state, that however desirable union might be, yet he should abhor union if it were to be purchased by a compromise of principle. (*Loud cheers.*) He should abhor union if, in order to obtain it, they were to leave out of consideration any point which was essential to the furtherance of the object they had in view. (*Cheers.*) He should abhor union if, having met there for one simple purpose only, and having effected that purpose, they should depart without stating their views, both as to the cause of the distress under which they were labouring, and as to the proper means for remedying that distress, to which it was incumbent on them to call the attention of Parliament. He merely stated this in the beginning, because he knew that after the formation of the Central Society should have been effected, it was the intention of several individuals, and especially of one noble lord (Chandos), whose talents all present must most highly respect, and who had come among them to give them the benefit of those talents (*cheers*)—to lay before the meeting some views which they, in common with a very large majority of the thinking part of this kingdom, entertained on those two points—the cause of the distress and the remedy. (*Cheers.*) Having said this, he would proceed to read the whole of the resolutions, which would afterwards be put from the chair separately. If any gentleman should be disposed to move an amendment on any of them, he would earnestly entreat him to abstain from all extraneous topics until the whole of the resolutions in their present or amended form should be passed. From the adoption of those resolutions he believed very great advantages would be derived, not to the agricultural interest only, but to all the other interests in the State. (*Cheers.*)

The following resolutions were then read, and having been put one by one from the chair, were adopted unanimously, without any amendment.

On the suggestion of Lord WYNFORD, the name of Sir Percival Dyke, Bart., was added to the list of the Committee.

" 1. That notwithstanding the efforts of the Local Agricultural Associations, the distress of that great and important portion of the community which comprises the three branches of landlords, tenants, and labourers, has been rapidly increasing since the peace, and has now reached a degree threatening the destruction of the landed interest, and all connected with it, it is therefore the opinion of the deputation here assembled, that a Central Society for the Protection and Encouragement of Agriculture, and totally divested of party or political feeling, be formed in the Metropolis, to be called 'The Central Society of Great Britain and Ireland.'

" 2. That 'The Central Agricultural Society' shall be under the effective direction of a President, six Vice-presidents, and a Committee of forty members, with a chairman and deputy-chairman; the whole to be elected annually, and that nine form a quorum; that in addition to the above-named forty members, each Local Agricultural Association subscribing 5*l.* annually shall be entitled to depute yearly two of their body, who shall be privileged to vote and act as members of the Committee; that the Presidents of each of the Local Agricultural Associations, Peers of Parliament, and County representatives, being members of 'The Central Society,' shall, *ex-officio*, be members of the Committee; and that the secretaries of each of the Local Subscribing Associations shall be *ex-officio* members of the Society.

" 3. That the Committee shall be elected annually at a general meeting of the Central Society, to be held in London for that purpose in each year on the last day of the Smithfield Cattle Show.

"4. That the Committee shall have the power of admitting members up to the 1st of January, 1836, after which period no individual shall be admitted a member unless two-thirds of the Committee present vote for his admission, or unless he be recommended by the Agricultural Association of his own district.

"5. That in the formation of the Committee for the ensuing year, one member of each District Association be first inserted as members of such Committee; that the following Noblemen and Gentlemen shall form the Committee of 1836, with power to complete the number, to draw up the rules, regulations, and bye-laws, for the constitution and management of the Society, and to appoint the President, Vice-Presidents, and Officers.

"6. That R. Montgomery Marten, Esq., and R. Broun, Esq., the secretaries, be *ex-officio* members of the Committee.

"7. That in case any gentleman now named should decline acting, the Committee (having reference to the respective counties in which such vacancies shall have occurred), shall have the power to fill up the vacancy until the next annual meeting."

The Secretary having read the names of those who had consented to become members of the Association, amongst whom were Lord Gage, Lord Teynham, Lord Farnham, Lord Wynford, the Earl of Darlington, and many other noblemen and gentlemen of distinction,

The CHAIRMAN said it was now his pleasing duty to congratulate the meeting on the formation of the Central Agricultural Association (*cheers*), an Association affording a combination which had long been wanted—a combination of all the various Agricultural Societies which were distributed throughout the country, each in itself weak, but all, when united into one body, in the shape of such an Association as that which he had then the honour of addressing, certain to carry weight and to command attention. (*Hear, hear.*) He also begged leave to congratulate the meeting on the perfect unanimity which had prevailed, as well on the day previous as on the present occasion. It was highly satisfactory to find, that, throughout the whole of their proceedings, there had not been a single dissentient voice. (*Hear, hear.*) Every resolution that had been proposed had met with the entire approbation of the meeting. The Society being formed, he found by the advertisement, in consequence of which the meeting had been convened, that the next point to which they were invited to direct their attention, was the cause of agricultural distress, and the measures necessary to be adopted for its relief. If, therefore, any gentleman wished to deliver his sentiments upon that subject, he should be happy to hear him. (*Hear.*)

Earl STANHOPE being generally called for, rose and said, that it afforded him great satisfaction to be present at that numerous and most respectable meeting, composed as it was of persons coming from all parts of the kingdom, possessed of great practical knowledge and experience upon the subject which they were called on to discuss, and animated by the most patriotic desire to assist in the proceedings of any meeting convened, as that meeting was, for the purpose of consulting as to the cause of the unexampled and intolerable distress under which the agricultural interests of the country were then suffering, and of considering the means by which that distress might be removed or palliated. (*Cheers.*) After the allusion which had been made by the gentleman who so worthily filled the chair, to the advertisement by which the meeting had been convened, it would not be considered as out of order if he addressed to the society some few words on that part of the subject, which was of primary and paramount importance, namely, the cause of the unhappy situation of the

landed interests, which every one must so deeply deplore, (*hear, hear,*) which every one so severely felt, and which could not be allowed to continue without imminent danger of leading to a disastrous and tremendous conclusion. (*Hear, hear.*) He begged to assure the meeting at the outset that there was no one in that assembly, or in the country, who felt more deeply impressed than he did with the advantage of unanimity, well knowing that it was from union alone that the agricultural classes could hope to obtain relief. (*Hear.*) And if that meeting were what it professed to be, and what he really believed it was, not in name only but in substance—a general meeting of the agriculturists of England, he would ask whether, having once assembled, it was prepared to separate without expressing any opinion whatever either as to the cause or remedy for the evil of which they had all so much reason to complain (*cheers*)? He begged to be allowed to say a very few words as to one of the imputed causes of the distress, but which he did not believe to be the true one. No man had more strenuously opposed than himself the alteration of the former corn laws, founded as he believed those laws were, upon the only sound and just principle upon which such laws could be established, namely, a perfect exclusion of all foreign corn from the markets of this country till the prices in this country were such as to show an absolute deficiency in the amount of the produce. (*Cheers.*) Subsequent experience had confirmed the correctness of the opinions which he then expressed. But however mischievous the principle of allowing foreign corn to be imported at all times might be—creating as it did a nominal price, much higher than the price in reality, still it could not be fairly contended that the corn laws were the cause of the present distress, and for this simple reason, that for a considerable period of time the prices of native corn had been so low, and the removal of duty on the importation of foreign corn in consequence so high, as in point of fact to amount to a positive prohibition. What then was the cause of the unparalleled distress under which the agricultural interests were labouring? It was to be found in that great edict of confiscation familiarly known by the name of Peel's Bill. (*Great cheering.*) To that measure, adopted as it was now confessed to have been, in entire ignorance of what its probable workings would be, recommended by false hopes in those who brought it forward, and holding out false expectations to those by whom it was supported—to that measure, which had obliged many persons to sell their patrimonial inheritances, was to be attributed the general distress of the agriculturists; (*hear, hear,*) and the highway-robbery which had been committed under its provisions was designated by the mild and gentle phrase of a transfer of property. (*Cheers.*) What was a highway robbery but a forcible transfer of property (*cheers*)? This then he maintained was the cause of the depression of the agricultural interest; and he proved it to be so, not only by the absence of every other cause, but by this theory—that the resumption of cash payments having greatly contributed to reduce prices, had in a still greater degree contributed to lower wages. (*Hear, hear.*) A proof of the correctness of his view of the subject was afforded in the effect produced, in the year 1818, by an issue of Exchequer bills. What took place in the following year? In 1819 the late Lord Liverpool induced Parliament to increase the annual taxation of the country to the extent of £3,000,000. Let any minister of the present day, whether Whig or Tory, endeavour to make a similar experiment, and what would be the result? He would find it to be practically impossible. An-

other proof was to be found in the course which Parliament took in the year 1822, when by the issue of small notes some alleviation was afforded to the distress under which the country had been suffering in consequence of the measure of 1819. (*Hear, hear.*) They stood now, fortunately, in a very different situation with respect to popular opinion, to what they did at the period to which he had just referred. It was at the commencement of that year when an address was moved to the crown in reply to the generous speech which had been delivered from the throne, that he (Lord Stanhope) suggested an amendment to the effect that the House of Lords should pledge itself to institute an inquiry into the cause of the distress which at that time existed, and also into the effect produced by the alteration of the currency. What support did he then receive? He was determined to take the sense of the house upon the question, and found himself left in a minority of three. (*Hear, hear.*) But at a later period of the session, the ministry of the day, without having the candour to acknowledge that they were mistaken in their views, and without explaining their motives or intentions, made that alteration in Peel's bill which was the sole cause of the prosperity of which the Chancellor of the Exchequer in the following year made so great a boast. (*Hear, hear.*) At that time, which was indisputably one of general prosperity, the price of wheat was double what it was at present. It mattered not whether prices were high or low, provided that a proportion between prices and payments were equally sustained. (*Hear, hear.*) He defied the ingenuity of man to devise a mode by which the distress of the country could be relieved other than by reducing payments, including the payment of the interest on the public debt, to the level of the present prices, or else to raise those prices to a level with the payments which the agriculturists were called upon to make. (*Cheers.*) What was the present price of wheat? The last average was 36s. for the imperial quarter, being, as all whom he addressed well knew, but 34s. for the quarter measured by the old-fashioned Winchester bushel. (*Hear, hear.*) Compare this with the price of wheat at any former time. In the ten years of peace which elapsed between the close of the American war and the commencement of the French revolutionary war, the average price of wheat was about 50s. per quarter. Even a century ago, in 1735, he found, from the best sources of information which were open to him, that the average price of corn was 4s. per quarter higher than it was at present. (*Hear, hear.*) He repeated that it was a matter of indifference whether prices were high or low, provided there was a just proportion between prices and payments; but if the price of corn was factiously reduced, the land would not long be capable of sustaining the debt of the country. If it were determined to afford no protection to the land—be it so; but let those who had money in the funds, or in savings' banks, be prepared to endure the loss of it. It was urged as a proof of the goodness of Peel's bill, that it had received the support of both factions in Parliament. The same argument had also been subsequently applied to the new Poor Law Bill—a measure second only to Peel's bill in the oppressiveness and cruelty of its provisions. This junction of parties to support particular measures, reminded him of a story which was told of George III. That monarch was reported to have said—"I believe that Pitt is generally right; it is possible that Fox may occasionally be in the right; but when Pitt and Fox agree together, then I am perfectly sure that both of them are wrong." (*Laughter and cheers.*) He was disposed to think the same

of the two parties in the legislature, when he found them uniting only to carry such measures as Peel's bill and the Poor Laws' Amendment act. (*Cheers.*) With respect to the question of the currency, a cabinet minister had said to him—"If we were to vote by ballot in both houses of parliament, you would carry your opinions by a great majority." (*Great cheering.*) It appeared then that it was the force of party, from which he (Lord Stanhope) had the happiness and the honour to be altogether excluded, that prevented the true expression of opinion in the legislature. (*Hear, hear.*) If that were the case, it was time that the country should raise its voice loudly and generally for a remedy of the grievances under which it was labouring. (*Hear, hear.*) When he spoke upon the subject of the currency, and when he deprecated the operation of the bill of 1819 as productive of all the ills and all the distresses which had since ensued, he begged it to be distinctly understood that he had never proposed an alteration of the standard of value. He had never considered the proposal which was made that a half sovereign should pass for a whole sovereign in any other light than as an extreme injustice. It might be a very convenient mode for debtors to pay their debts at the rate of 10s. in the pound, but it was not a measure founded in justice, and consequently not a measure that he would either propose or support. (*Hear, hear.*) Rather than assent to such a measure, if he were obliged to continue the currency as it now was, he would adopt the triple ratio—the equitable adjustment as proposed by the late Mr. Cobbett. He (Lord Stanhope) would propose not to alter the standard to the extent of 50 per cent., or to any indefinite amount, but to replenish the country with paper (*great cheering*)—paper of a valid description. (*Renewed cheering.*) On a former occasion he (Lord Stanhope) had proposed the establishment of a silver standard of value, which he believed would be sufficient to give great relief. He would not now propose to make any alteration in the paper of private banks, but he would propose the establishment of a new medium of circulation in paper (*cheers*), so secured that the holders of it should not be exposed not only to any subsequent loss, but to any present inconvenience. (*Cheers.*) He would propose also the issue to an immense extent of the lowest denomination of Exchequer bills. (*Hear, hear.*) In effecting this change in the currency they would be greatly raising the nominal, though not the real, price of corn; (*hear, hear.*) and, consequently, unless a corresponding alteration were made in the present corn-laws, they would greatly facilitate the importation of foreign corn. (*Hear, hear.*) Upon that point, however, he would not then dwell at any length, it was enough for him to say that he had prepared, with great care—enlightening himself with the opinions and advice of those who best understood the subject,—a series of resolutions, which it was his intention to propose to the House of Lords, to be considered by a committee of the whole house, whenever he received that support, either in parliament or out of it, which would enable him to act with any hope or expectation of success. (*Cheers.*) He had also prepared a series of resolutions with regard to the new poor-law bill, embodying provisions which he believed would be acceptable to all the poorer classes, and generally conducive to the well-being, prosperity, and tranquillity of the country. (*Hear, hear.*) To that end it would be necessary to repeal the odious and oppressive bill which had unfortunately established in this country an arbitrary, unconstitutional, and irresponsible tribunal, upon

whose decision depended the happiness or wretchedness of all the humbler classes. There was another point in connection with the question of the currency to which he begged leave most especially to direct their attention. As he had already intimated, the immediate effect of altering the currency would be to raise the price of all articles of consumption, and of corn amongst others. (*Hear, hear.*) Such he was ready to admit would not only be the effect, but the object and design of an alteration of the currency. If the price of wheat rose 10s per qr., it undoubtedly followed that the price of bread would rise in a much greater ratio. That being the case they were bound to the country, and especially to those most useful and most laborious members of the community, to whose industry they owed all that they possessed—he meant the labourers in husbandry, the poor cultivators of the soil—to take measures to prevent any great increase of prices till a corresponding increase had been made in the amount of wages. (*Hear, hear.*) Not long since he had read in that excellent newspaper *The Morning Herald*, a statement which proved beyond all possibility of doubt that which he (Lord Stanhope) had before supposed to be the case—that the price of the quarter loaf was at present nearly double as high as it ought to be in proportion to the price of wheat, and in consequence the consumer had not the full advantage of the low prices. He believed that the great luminaries of the age, the political economists, were the guilty cause of this evil. (*Cheers.*) In ancient times the price of bread was fixed in proportion to the price of grain, and even in the present day, in many of the Continental States, the retail prices of provisions were from time to time fixed by the magistrates in proportion to the wholesale prices. By this means fraud was prevented, and the poor protected. (*Hear, hear.*) Alluding to the Marquis of Chandos, who was present, the noble earl said that there was no one in that assembly, in that metropolis, or in the kingdom, who venerated more highly than he did the talent and patriotic zeal of his noble friend (*hear, hear*); no one felt more strongly than he did that which he was sure all whom he had the honour to address must feel from the bottom of their hearts, the gratitude which the noble marquis deserved, and always would receive, for his zealous, persevering, unremitting, and most patriotic exertion on behalf of the agricultural interests (*cheers*;) consequently there was no one from whom he differed with greater pain. But differ from him he must upon this point, if the noble marquis thought that they should merely state their grievances to Parliament, and ask for a committee of inquiry. (*Cheers.*) He (Lord Stanhope) thought they ought to demand redress. (*Great cheering.*) He believed, that unless redress were granted—full, effectual, and speedy redress—it would be found impossible for the country (however anxiously disposed it might be to do so) to fulfil peacefully and honourably all the engagements it has formed (*hear, hear*;) he believed it would be impossible to continue much longer the payment of the interest of the national debt. (*Hear, hear.*) He was totally at a loss to conceive what benefit was now to be anticipated from the appointment of a committee of inquiry. He had himself brought forward a proposition of the kind in the session of 1830: nearly six years had since elapsed, during which nothing had been done; and now they had arrived at a period at which delay might be fatal. (*Cheers.*) With that feeling he (Lord Stanhope) should propose to those who thought they could bring forward any proposition upon the subject, with a reasonable expectation of

receiving the support of parliament, that they should move, in the first instance, that their resolutions be adopted and printed, and subsequently that they should be taken into consideration not by a select committee, but by a committee of the whole house. (*Hear, hear.*) The noble marquis would recollect that a committee was appointed in 1833, of which he was a distinguished member. He (Lord Stanhope) attached great importance to the report, or rather to the evidence upon which the report of that committee was founded: for the report itself, though it gave in some respects a candid view of the situation of the country, came at last to this most lame and impotent conclusion—that relief to the landed interests was to be hoped for, not from the active interposition of the Legislature, but from its cautious forbearance. He knew it was a good maxim to “let well enough alone;” but it was from the report of the committee of the House of Commons that he learnt, for the first time, that where evils were acknowledged to exist, no attempt should be made to remove them. (*Hear, hear.*) The report of that committee had since been appealed to by Sir Robert Peel; but was Sir Robert Peel aware that the national debt was not contracted in gold, and could not be paid in gold? (*great cheering*) and for this simple reason, amongst others, that all the gold in the country—nay, all the gold in the world, did not equal the amount of our national debt. (*Cheers.*) They were often reminded that Earl Grey, in his parting speech, on quitting the reins of government, had told them that the greatest relief that could be afforded to the agriculturist would be by the reduction of rents. This was the same sort of comfort as would be afforded to a lame man, who, in complaining of not being able to walk, should be told by his physician, “Oh, the remedy for that is to sit quietly in your chair.” (*Laughter and cheers.*) It was, in fact, totally impossible that any great relief could be afforded by the reduction of rents; for he had calculated, that even if the whole of the rent were taken off, the reduction in the price of bread would not exceed three-farthings in the quarter loaf. He might be asked why, entertaining these opinions, he did not appear to support them in his place in parliament? To such a question he could only reply, that he seceded from his exertions in parliament on principle, finding that he did not receive, either in or out of the house, such a support as could make him useful. Finding, also, that his opinions were scoffed at by those who were the authors of calumnies against the agricultural interests, and that he was accused, when he stated facts, of making statements exaggerated and unfounded. (*Hear, hear.*) Under such circumstances, as an humble individual, he washed his hands of all responsibility upon the subject, and withdrew from his labours in parliament. Leaving to those who remained behind him the undisputed, undivided responsibility of the calamities, nay of the convulsions which he believed would necessarily follow the resistance of all propositions for affording relief to the land. (*Cheers.*) When he saw a different feeling obtain in men's minds, when he found the country alive to the importance of the lauded interests, he should return to his post, and no exertion should be wanted on his part to procure that relief which had now become so imperatively necessary. (*Cheers.*) In the course he had pursued he had never been actuated by a selfish object. He always had acted, and always would act, as an independent man, asking for nothing, caring for nothing, and wishing for nothing that any government had it in its power to bestow. (*Cheers.*) After some further observations, the noble earl expressed an ardent

wish that all whom he had the honour to address, casting aside party feelings, and acting without reference to party denomination, should zealously and cordially co-operate to procure the passing of such measures as were necessary to the safety, the security, nay, even to the existence of the country. (*Cheers.*) In discussing their own grievances, and considering of the means by which those grievances might be redressed, he conjured the agriculturists (and upon this point he felt he could not lay too much stress) never for one moment to be forgetful of the interests of that useful and meritorious class, upon whose industry and whose welfare the prosperity of the whole community depended—he meant the agricultural poor, the industrious labourers in husbandry. (*Cheers.*) The noble earl concluded by moving a resolution to this effect: “That nothing can remove the present overwhelming distress but the adoption of some measure which will either raise the price of produce to the level of the burdens imposed, or bring down the burdens to the level of the present prices.” (*Great cheering.*)

Mr. WOODHOUSE seconded the resolution. He had heard it remarked that the question of the currency ought not to be mixed up with the question of agricultural distress; but the fact was, that the two were so intimately blended that it was impossible to discuss the one without referring to the other. (*Hear, hear.*)

LORD TEYNHAM was proud to see the British Lion of agriculture at length aroused; and he trusted that she would never sleep until she had obtained that redress which was due to her from the legislature of the country. (*Cheers.*) He had united his best efforts with the strenuous exertions of the noble and learned lord now present, (Lord Wynford,) to effect some modification of that harsh measure, the poor-law bill, which operated so severely upon the working classes of the community. The agricultural labourers, the bold peasantry of England, once their country's pride, and he would not now say their shame, were the foundation on which a great and powerful association must be formed. Let landlord, tenant and labourer be united, and all that could be required in justice, and on principle, for the relief of the agricultural interest must be done. He, therefore, should submit that measures should be taken to investigate the condition of the agricultural labourer, by a committee of this association, in order that at a future meeting the labourers themselves might be enabled to state their grievances, and petition for redress. There were two causes that reduced the price of agricultural produce: one was the increased produce of Ireland. He considered it would be the duty of members of parliament next session to propose, among the first things to be done, that the poor-laws should be taken into consideration, in order that some general code might be formed, which should be applicable to the whole empire; and he knew of no man more capable of bringing forward such a motion than the noble lord who sat at the right of the chair.

LORD STANHOPE said he had already prepared a series of resolutions upon the subject, to be brought forward in parliament when it could be done with effect. (*Cheers.*)

LORD TEYNHAM proceeded to comment with considerable severity on the new poor-law bill, describing it as an Algerine act, and stating that its effect had been to cover the whole land with dungeons, and houses without windows. (*Cries of “no, no, chair, chair! and hisses,” from many parts of the room.*)

MR. HERBERT CURTEIS, M.P. rose to order: The two noble lords had alluded to the abuses of the poor laws, although they knew that they were speak-

ing in the presence of many gentlemen, who, in parliament had been the warm supporters of that measure. (*Cheers.*) He (Mr. Curteis) had given it his feeble but hearty support, and he believed that in his own county the bill was working extremely well. (*Cheers.*) If, therefore, the noble lord, (Teynham) persisted in his remarks, he (Mr. Curteis) should undoubtedly claim his right to answer the noble lord forthwith. (*Loud cheers, and cries of “Chair, chair.”*)

The CHAIRMAN could easily understand what were the feelings of the hon. member for West Sussex on hearing a favourite measure of his attacked. The meeting had been convened on an agricultural subject, and it had been decided that neither party nor political topics should be introduced. (*Cheers.*) If he had perceived that politics were alluded to in the slightest degree, except as they referred to the subject of agricultural distress, he should have considered it his duty instantly to put a stop to it. He would now particularly request those gentlemen who might find it necessary to allude to questions which might happen to have a distant bearing on agricultural subjects, that they would couch their language in a style that might not give offence to any individual. (*Cheers.*)

LORD TEYNHAM could assure the hon. member for West Sussex that he did not intend to make any reference to anything that had been done under the bill in the county of Sussex in particular. [Mr. Curteis: “No, no! in the country generally!”] Though the hon. gentleman knew as well as he (Lord Teynham) did that his own parish in Sussex was in such a state of disorder at the present moment that—(*No, no, order, chair.*)

The CHAIRMAN: I call the noble lord to order.

MR. H. CURTEIS: I rise most distinctly to contradict that assertion of the noble lord. (*Hear, hear.*)

The CHAIRMAN: I have called the noble lord to order. (*Hear, hear.*)

LORD STANHOPE rose to order. It was undoubtedly true that in what he had had the honour of addressing to the meeting, he alluded more than once to a subject intimately connected with the landed interest, and which he considered of paramount importance—he meant the situation of the labourers in husbandry as being affected, in the hon. member for Sussex's opinion favourably, but as he (Lord Stanhope) thought unfavourably—by the poor laws. He wished, however, the noble lord who had been called to order, to consider that the resolution now before the meeting related solely and exclusively to the question of the currency, and that that question ought therefore to form the sole subject of his remarks.

LORD TEYNHAM made several ineffectual attempts to address the meeting again: but the calls for Lord Wynford were so loud and general, that he finally gave way and resumed his seat.

LORD WYNFORD (who on account of his infirmity kept his seat while speaking) observed that he was among so many who belonged to that house to which he unworthily belonged, that he almost fancied himself in the House of Lords. He believed no one would doubt that he was a sincere friend to agriculture, and he had to complain of being as feebly supported in his efforts to serve that interest as his noble friend had been. Three or four years ago he moved for a committee to inquire into this very subject. He was sorry that committee was not granted. He would not say why it was not, though that reason was not unknown to him and the knowledge of it had made him quite as sick of party as his noble friend could be. He had determined during the remainder of his life, on no occasion to be influenced by any party, but to act upon the dictates of the best judg-

ment he was capable of forming on whatever subject might come before him. To the resolution proposed by his noble friend he did not see any objection, because it was couched in general terms and proposed no specific mode of redress. If it had, he should have objected to it, because he thought as a member of parliament that he ought not to have concurred in it. He was not fond of pledges. (*Cheers.*) He did not wish to go to parliament lettered. (*Cheers.*) And if he might be allowed as an old man, to suggest (and he was sure the gentlemen present who were members of the House of Commons, would excuse him for making the suggestion,) he would say that it would be better for them to abstain from giving pledges. (*Hear.*) One man thought the state of the currency was the cause of all their misfortunes, while other men ascribed those misfortunes to very different causes. Now although he was of opinion that the alteration of the currency was the first or proximate cause of agricultural distress, yet he believed that that distress would have ultimately arisen even although the currency had never been altered. (*Hear, hear.*) It was impossible that such a state of things could exist in any country, as that of the produce of one-third of that country being untaxed, and yet being allowed to enjoy all the privileges of the general market, and all the protection which the existing laws were calculated to give it, without producing great evils to the agricultural interest. (*Cheers.*) He confessed for one that he should wish to see committees in both Houses of Parliament, on the subject of agricultural distress. (*Cheers.*) He knew the industry with which every question affecting the interests of the country was examined in the house to which he belonged. He thought that every person connected with agriculture should have an opportunity to state his opinion as to the cause and the remedy of the distress which that interest endured. But he was very anxious that they should all abstain as much as possible, from giving opinions on the subject at meetings like the present, because every opinion given by any man at that meeting, however right it might be, would be firmly believed, raise up many enemies against him. (*Hear, hear.*) He therefore wished that they could have closed their labours that day with merely forming a committee of the general society, without expressing their opinions upon the agricultural question until they had retired to a private room to confer and consult with those who would assist them in both houses of parliament, and who, of course, must be their friends. (*Hear, hear.*) However the resolution could not be objected to, because it stated that which no man could doubt, namely, that in some way or other the agricultural interest could only be relieved by raising the prices of agricultural produce, or by bringing down the burdens of the country to a level with the present low prices. (*Cheers.*) He would not speak on this topic now, because he was afraid that in the warmth of their discussions they would broach opinions that would give great alarm elsewhere. They must consider that whatever the agriculturists were formerly, they were not now strong enough in the House of Commons at least [in voice, "There is the evil"]. He wished, therefore, before any resolutions of any sort should be proposed, that they should desire both Houses of Parliament to grant them committees, where every one would have an opportunity of expressing his opinions. They would then be much more likely to make an impression on the mind of the country, by the reports of those committees, than they should be by declaring their opinions on the subject now. He firmly believed that those towns which were not

peculiarly connected with the home trade or the foreign trade, felt as much the distress of the agricultural interest as the agriculturists themselves (*hear, hear!*); and he was anxious to go before the committees of the two Houses with some of those persons, in order that they may be examined on that point. He had no doubt that those persons would tell the committees and the country that the present meeting were not only fighting the battle of the agriculturists (though even that was a great and noble fight, when it was considered that the interest of the peasantry of the country were connected with it,) but that their operations were extended to all classes and descriptions of the people. (*Cheers.*) The foreign trade of this country must, at no distant period, be feared, be much diminished, if the accounts which were now received of what was doing in Germany and in America were true. (*Hear, hear.*) "Let us, then," to use an expression of Earl Grey on a memorable occasion, "put our house in order (*cheers*); let us, when our foreign trade is gone, be prepared for that which will be alone sufficient for us." (*Cheers.*) He believed that they would find persons in the towns who, if examined, would tell the committees that the home trade was suffering so much from the depression of agriculture, that if relief were not afforded to the landed interest, they themselves would soon feel all the evils that afflicted that interest now. Thus they would have the voice, not only of one description of people in the support of their cause, but of all the industrious classes of the community. If, too, they would speak out, he doubted not that the fundholders themselves felt some apprehension for their incomes (*laughter and cheers*), which however, he hoped to God would never be affected. No man was more anxious than himself to preserve the national faith; but the fundholder might ere long be induced to feel that the best mode of preserving the faith of the country was to enable the country to keep its faith. (*Loud cheers.*)

Mr. BALLS, of Burwell, rose to address the meeting, but the calls for the Marquess of Chandos were so general that he immediately gave way.

The Marquess of CHANDOS gladly availed himself of the opportunity of following the noble and learned lord whose opinions on the question before the meeting appeared to be so nearly similar to his own. The complaint which had always been made against the agriculturists of this country was that they were not a united body. It had always been his earnest hope that every thing that could possibly savour of a difference of opinion should be withdrawn, for from want of union their efforts to obtain that relief which they had a right to demand (and which he hoped in God they would soon have) had always failed. They must then, above all things, go before Parliament united; if they did not, they would, in all probability, meet with the same result as they had met with last session. It was not for him to express in that Hall his opinion as to what might be or not the relief which the agricultural interest required. Different opinions existed to a great extent amongst themselves on that subject; and he would not be the man, connected as he was with the farmers, to throw discord into that assembly, or to propose one measure that could hurt the feelings of any man, or render it possible that the members of the Agricultural Association should be disunited. (*Cheers.*) He would implore the meeting, before they proceeded further, to consider whether, being, as they were, united up to the present moment, it would not be better to defer the discussion of the cause, or causes, of agricultural distress. (*Hear, hear.*) He had no hesitation, how-

ever, in stating what it was that he himself had thought of doing. After the failures which had taken place, and after the defeats which the farmers had experienced, no man who felt an interest in the question could be easy in his mind until he saw some hopes of redress. After consulting then, as he had done, men of every opinion—political characters as well as private individuals on the subject—he had come to a conclusion, under the cognizance of many members of parliament, that it would be best to move as early as possible in the ensuing session of parliament for a select committee to enquire into the causes of agricultural distress, and to report thereon, for the purpose of giving immediate relief. It was before that committee that witnesses on all sides could be examined, and it would be the duty of that committee, both to their constituents and to the people at large, in their report, to set forth what they considered to be the real cause or causes of the agricultural distress prevailing throughout the country. If the difficulties had arisen in the House of Commons owing to the differences of opinion that existed there as to the cause of agricultural distress, what must the difficulties be in that room, where there was so large an assembly of persons interested in the question? Therefore, without giving, directly or indirectly, any opinion whatever on the currency question, or on any other question (but which he should be prepared, as an independent member of parliament, to give in his place), he would again implore the meeting, for the sake of unanimity, and for the sake of their going forth to the country as an united body, to allow a committee at once to be called for, and at the bar of that committee to plead their cause. (*Cheers.*) If, however, that view of the subject should not coincide with the opinion of the majority of the meeting, he felt that he should only have done what he considered his duty in expressing the opinion he conscientiously entertained as to the course which they ought to pursue; and he should reserve to himself the right to take that course, if in his judgment he considered it would relieve the distress and promote the prosperity of the agricultural interest of this empire. (*Cheers.*)

Mr. BALLS supported the resolution. It was plain that things could not long continue as they were at present. Either the burden must be reduced or the means of sustaining it increased. (*Hear, hear.*) He had listened to the whole of the proceedings of that day with interest and attention, but there was one part of the speech made by the noble earl (Stanhope) which had excited his utmost astonishment, and made an impression upon his mind deeper than any thing he had ever before heard. Was he not mistaken when he understood the noble earl to say that a cabinet minister had told him that if the members of parliament had voted by ballot upon the question of the currency, as connected with agricultural distress, a large majority of both houses would have been in favour of his view?

Earl STANHOPE: The hon. gentleman understood me most correctly. Such was the statement made to me by a cabinet minister. (*Cheers.*)

Mr. BALLS was to understand then, upon the authority of a Cabinet Minister, that a vast majority of both houses of the collective wisdom of parliament, if left to the exercise of their own unfettered judgment, would declare that the state of the currency was the cause of the distress under which the agricultural interests were then labouring. (*Cheers.*) This afforded matter for deep consideration, and it was necessary that it should be well and maturely pondered. The noble and learned lord (Wynford) had said that the farmers constituted the most amiable class of so-

ciety. It was that amiability which had been their ruin. (*Hear, hear.*) They had not been impotent—they had not been turbulent—they had not wielded the bludgeon or hurled the brick-bat, but had entreated so gently, in voice so faint and meek, in whispers so low and soft, that the ministers of the day had always found it more convenient to listen to the louder and more threatening petitioners, and to pass by the prayers of the meek and gentle unheeded and uncared for. (*Hear, hear.*) It was time that the farmers of England should adopt a bolder and more determined tone. (*Cheers.*)

Mr. CAYLEY, M. P., wished to express his entire and cordial concurrence in the sentiments contained in the very able and eloquent speech which had been made by the noble earl (Stanhope) who sat on the right of the chair; but at the same time he must coincide in the propriety of the course of action pointed out by the noble marquess (Chandos). He had long been of opinion that the only mode by which the agriculturists could hope to obtain a redress of grievances must be by the formation of such a union as that which he trusted had taken place that day. (*Hear, hear.*) He fully concurred in the observation of the Cabinet Minister referred to by the noble earl (Stanhope,) that if the votes of the House of Commons were taken by ballot, a large majority of its members would be found to coincide in the opinion that the state of the currency was the cause of the depression of agriculture. (*Cheers.*) But whilst men's votes were liable to be scanned, and as long as they were liable to be taunted with breach of political faith, he feared it was vain to look for any successful support of that doctrine in parliament. What had been the fate of all the motions which had been brought forward upon the subject? In 1822 Lord Western had only 40 members of the House of Commons who would support him. In 1830, Mr. Davenport had only eighty. In 1833, Mr. M. Attwood had a majority of some 300 against him; and in the last session of parliament he (Mr. Cayley), on bringing forward a motion for the establishment of a silver standard of value, found only 180 to support him. Thus it would be seen that little encouragement had hitherto been afforded to supporters of agriculture in parliament; but backed by such an association as that which had just been formed, and which he had then the honour of addressing, he should look for brighter days, and should not despair of seeing the legislature brought to declare the truth of propositions which every intelligent member had felt, though not always dared to admit to be true. (*Hear, hear.*) High prices were spoken of as an evil; but it should be remembered that they were only nominal; and on the other hand, he would ask of what value were low prices if the labourer had no money in his pockets? (*Hear, hear.*) High prices, with good wages, were infinitely more advantageous to the working classes than low prices and little or no wages. The agricultural labourers at present employed were, no doubt, well off; but how many were not employed? Formerly, at the hiring fairs, it was the care and business of the farmer to go round and to seek in every corner, in every place of resort in the neighbourhood, for the labourers he wanted; and it not unfrequently happened that he was disappointed by finding none. The case was widely different now. The fairs were thronged by wretched emaciated creatures, who pursued the farmer and entreated, nay, almost prayed upon their knees for employment, even of the most trifling and least lucrative description. (*Hear.*) It was a just observation that the interest of master and servant could not be separated, and for a long

time past they had been suffering together. For the last ten or fifteen years the wages of the labourer had been paid, not out of the profit but out of the capital of the farmer. (*Hear, hear.*) He wanted to restore the profits of the farmer, and he knew it could not be done except by adopting one of the two alternatives suggested in the resolution proposed by the noble earl (Stanhope.) (*Cheers.*) It had been said that Parliament could do nothing to remedy the evil. Such an assertion was only adding insult to injury. (*Cheers.*) It had been asked, too, "Why does not the farmer come down in his style of living?" Gracious God! if any one saw how the farmers of England were now living, such an observation would never be heard. (*Cheers.*) It was necessary that the agricultural interest should arouse itself and make its grievances and its distresses more generally known and more generally understood. (*Cheers.*) Parliament had hitherto done everything it could to baffle inquiry, and to conceal the effects of the existing state of the currency; and the Association might rest assured that the Legislature would yield nothing unless the feeling of the country were strongly expressed upon the subject. (*Cheers.*) The motto of the agriculturists then should be, union and determination. (*Great cheering.*)

Mr. R. SPOONER rose for the purpose of briefly alluding to what had fallen from the noble marquis (Chandos), whose name must always be received amongst the friends of agriculture with unbounded respect and gratitude. (*Hear.*) But he was sure he should forfeit whatever good opinion he might happen to possess in the estimation of that nobleman if he were to shrink from telling him that he disagreed with him in the advice he had that day given to the meeting; and before he sat down he should call upon the assembly to reject the advice of the noble marquis, and unanimously to adopt the resolution of the noble earl. (*Hear.*) That resolution declared either that the burdens which bore upon the agricultural interest must be reduced or the means of sustaining them increased. He thought it was not incumbent on the society to pause even for one moment before it consented to the adoption of a resolution embodying such a plain and simple proposition. (*Cheers.*) He thought indeed it would be unbecoming a society formed as that had been, to separate without some expression of its opinion (*cheers*); and when the noble marquis recommended them not to declare their views or express their wishes, but merely move for a committee of inquiry, he (Mr. Spooner) for one, declared that he would not consent to approach Parliament with a concealed object. (*Cheers.*) He should be glad for Parliament to go into an inquiry into all the causes of distress; but he stated fairly and boldly before hand that the state of the currency was one of the main causes. The hon. gentleman then went into a very lengthened discussion of the currency question, contending throughout that the measure of 1819 had been productive of the principal evils under which the agricultural interests were then labouring.

Mr. ROBINSON, M.P., conceived that the question for the consideration of that hall and of the legislature, was not whether agriculture ought or ought not to be relieved, but how it ought to be relieved. (*Hear, hear.*) He believed that no class of the community could be indifferent to the distress of agriculture; for although commerce and manufactures might for awhile be more prosperous, still it was impossible that any one interest could long suffer without at last materially affecting the other. (*Hear, hear.*) He thought then that the proper question for their consideration on that occasion was, what remedy ought to be adopted. (*Hear, hear.*) He confessed he had been astonished to hear from the

noble earl, that a cabinet minister had so libelled the house of commons as to declare, that its determination on a particular question would have been different if the mode of voting had been secret instead of public. Whoever that cabinet minister might be, he (Mr. Robinson) would assert that no man ever uttered a more gross or unfounded libel upon that branch of the legislature to which he (Mr. Robinson) belonged; and when his hon. friend the member for Yorkshire (Mr. Cayley) stated his own opinion as coincident with that of the cabinet minister, he would only invite his hon. friend to get up and state it in the House of Commons, when he (Mr. Robinson) would venture to say he would be overwhelmed with a degree of reprobation— [The conclusion of the sentence was not heard, in consequence of the loud and conflicting cries of "no," and "yes," from all parts of the room.] He trusted that the observation dropped from his hon. friend lightly and inconsiderately (*hear, hear*); for he conceived that a more gross libel upon any body of men could not be uttered, than to state that they voted one way whilst their opinion was the other. (*Cries of "no, no," and cheers.*) With this general vindication of the house, he would not dwell longer upon the subject than to observe, that he never himself gave a vote in parliament upon any subject that he would not have given had he been under the seal of the ballot. (*Hear.*) But after what had taken place he certainly should recommend his hon. friend (Mr. Grote), when he brought forward the subject of the ballot in the next session of parliament, to propose that the mode of voting in the house of commons should be by ballot, as well as the voting for members to serve in parliament. (*Laughter and cheers.*) He came now to the resolution proposed by the noble earl (Stanhope). In some respects he admitted that resolution to embody a perfect truism, not only with respect to farmers, but with respect to every class in the community; because it was plain and obvious, that unless a man's means were proportioned to his expenditure, he must be a destitute man. But the great question that he wished to have resolved remained behind—namely, in what manner was relief to be afforded. Now he (Mr. Robinson) was of opinion, that without such an alteration of the standard of value, as, according to the declaration of parliament, would amount to a breach of the national faith, it would be impossible to raise the price of agricultural produce by any legitimate means (*disapprobation*); and even supposing that the legislature should be induced to alter the standard of value, had they then security that the labouring classes, in whose welfare the noble earl had expressed himself so deeply interested, would obtain labour and wages commensurate with the increased price of provisions. (*Cries of "Yes."*) He should like to know from the noble earl, who had no doubt deeply considered the subject, whether he felt a perfect security upon that point? He (Mr. Robinson) deprecated the bill of 1819 as much as any man; he believed that the right hon. bart. (Sir R. Peel) by whom it was brought forward, as well as the whole country, was at that time under a delusion upon the subject; but after the lapse of so many years, he entertained conscientious doubts as to how far it would be practicable to return to such a state of the currency as existed before the passing of that measure. (*Disapprobation.*) At the same time he should have no objection to the institution of an inquiry before the House of Commons as to how far it might be deemed possible or advisable to establish a conjoint standard of silver and gold combined with an issue of one and two pound notes by competent persons, affording good and sufficient security. (*Cheers.*) That was a point connected with the report which had never yet been fairly considered in parliament. (*Hear, hear.*) Although he (Mr. Robinson) was a ship-owner, and the representative of a manufacturing constituency, he had always contended that the main-stay and greatest source of the prosperity of the country consisted in its agriculture. (*Loud cheers.*) He did not wish to see one of the tillers of the soil converted into a spinner or a weaver. (*Hear, hear.*) He believed that the theory of neglecting agriculture at home, and importing all our grain from abroad, was absurd, and as long as he had

a vote to give, would never lend his assent to it. (*Cheers.*) But as regarded the present resolution he feared if it were agreed to, it would only appear to parliament as the opinion of this meeting that no relief could be afforded except by altering the standard, (*cries of "No, no,"*) and thus he feared it would tend to prejudice instead of benefit the cause of agriculture. (*No, no.*) Under all the circumstances, he thought the course pointed out by the noble marquis (Chandos) was decidedly the best.

After a few words from Earl STANHOPE in explanation,

Sir JOHN SCOTT LILLIE expressed his determination to support the resolution, and in doing so he did not conceive that he was supporting a proposition for a breach of the public faith. (*Hear, hear.*)

Mr. H. CURTEIS, M.P., was sorry that his sentiments were not likely to be in full accordance with those of that assembly. He felt great difficulty in giving his adhesion to the proposition then before them. He was ready to admit that he thought one of the great modes of benefiting agriculture would undoubtedly be to reduce all national expenditure; but at the same time he must beg to be understood as not giving his adhesion to the doctrine that day advanced relative to the currency. Upon that question he begged distinctly to be understood as not being committed; and although he was perfectly aware that the majority of that room would probably be of a different opinion, yet he would maintain there was a large portion of those as deeply interested in the interests of agriculture as any of those present, and were as anxiously watching everything that might tend to benefit or prejudice the land, who took a very different view of the nature of the remedy that should be proposed and adopted for the existing evils. If it were meant to be maintained that the only possible remedy that could be mentioned was an alteration of the currency, he begged to tell the gentlemen who entertained that opinion, that representing, as he did, almost exclusively, an agricultural population, and considering, as he did, the agricultural interest to be the paramount interest in the country, he should be sorry to hear that they were resting for an amelioration of their grievances upon so very slender and frail a reed. (*Disapprobation.*) He appealed to the noble lord whether he thought there was the remotest chance of carrying his views, even supposing them to be correct, through the house to which he belongs? (*Cries of "Yes."*) The noble lord, of course, knew much better than he could pretend to do, what prospect there would be of success; but he would appeal to the hon. member for Yorkshire, whether, from his past experience, he had the slightest expectation of convincing a majority of the House of Commons that his views relative to the currency were correct. (*Cries of "Yes."*) He heard gentlemen around him cry "Yes," but he heard it not from the lips of the hon. member. Undoubtedly he had that day heard the strongest argument he had ever met with in favour of the adoption of the vote by ballot. That question, upon which he had always entertained great doubt, he had always opposed in parliament, but—

The CHAIRMAN: Pardon me; now we are touching upon a political question which can have nothing to do with the matter properly under our consideration. (*Hear, hear.*)

Mr. CURTEIS was aware that at all public meetings it was bad taste to oppose the chair; but, on this occasion, he must take the liberty of saying that he somewhat differed from it in opinion. (*Great disapprobation, and general cries of "chair."*) The hon. member for Yorkshire had touched upon the subject of the ballot, so had the noble lord (the hon. member for Worcester), and several other gentlemen who had taken part in the discussion.

Colonel SIBTHORP rose to order, and pointed out how necessary it was that the authority of the chair should be supported. The gallant member had not concluded his remarks, when

Mr. CURTEIS rose to order amidst much confusion. He appealed to the chairman, as a member of parliament, whether it was fair for a gentleman to get up, as

the gallant colonel had done, to prevent another from addressing the meeting?

The CHAIRMAN explained that the hon. member for Sussex (Mr. CURTEIS) was out of order when he proposed to enter into an argument upon the subject of the ballot. Other gentlemen had only alluded to it incidentally, and then it was not irregular. (*General cries of "Question."*)

Mr. CURTEIS then proceeded to observe, that all he wished to do was in a manly, straightforward manner to mention, that in several agricultural meetings in his own county, he had professed opinions similar to those which he had just expressed; and he thought it would be unmanly in him to-morrow to return to those who sent him to parliament, and to say, that although he had been present at this general assembly, he was afraid to get up and express what his honest convictions were. (*Cheers.*) He yielded to no man in ardent attachment to the agricultural interests; and on several occasions, without considering the party to which he was politically attached, he had given his support to measures brought forward by the noble marquis (Chandos) opposite. (*Hear, hear.*) On the present occasion he merely wished to say that he could not allow this resolution to be carried without expressing his conviction that there was a considerable portion of the agriculturists who did not take exactly the same views of the subject as those which had been so prominently, and he would say, so ably and so eloquently put forward by the noble earl. Having stated this, and wishing also to guard himself against being supposed as standing committed to the currency question, it would not be his wish to break in upon the unanimity of the assembly. (*Cheers.*)

After a few words from Mr. CAYLEY in explanation,

The Marquis of CHANDOS asked whether he was to understand that the resolution proposed by the noble earl, in any way, directly or indirectly, pledged members of parliament upon the subject of the currency?

The CHAIRMAN having read the resolution, said it did not allude to any specific measure whatever, and, consequently, could not be taken as binding any one upon the subject of the currency.

Earl STANHOPE said that no person who voted for the resolution could be pledged to anything further than the resolution itself. (*Hear, hear.*)

The resolution was then carried, with only two dissentient voices.

The thanks of the meeting having been voted to the chairman, the meeting broke up soon after four o'clock.

**DRAUGHT OF HORSES.**—It is very important to be able to ascertain correctly the draught of horses under every circumstance, not only to ascertain their relative strength and muscular powers, but also the state of the roads and the merits of different implements of husbandry, especially of the draught required for the different kinds of ploughs. This was felt at the late ploughing match on Mr. Niblett's farm, when Sir John Byerley, who was present, suggested the employment of the Dynamometer, as answering perfectly the proposed end, and, on his return to London, he ordered one to be made by Messrs. Cottam and Hallen, the eminent engineers, which he has presented to the Agricultural Association of Gloucestershire. The draught of horses varies from 150 to 250 pounds, and sometimes, though rarely, exceeds the latter number. The instrument presented by Sir John, goes as far as one ton; so that the draught of eight horses, and of course any lesser number, can be accurately ascertained by it. These instruments are so useful, so simple, and at the same time so correct, that no intelligent agriculturist should be without it.—*Gloucestershire Chronicle.*

**THE PORKING EMPORIUM.**—One hundred and fifty-two thousand hogs were slaughtered last year at Cincinnati, and the papers of that city say the number will be much larger this year. The value of the pork exported the past year was not less than *two millions of dollars!*—*American paper.*

## MR. CAYLEY'S LETTER TO THE MARQUIS OF CHANDOS,

ON THE NECESSITY OF UNION AND CO-OPERATION AMONG THE AGRICULTURISTS, IF THEY WOULD OBTAIN RELIEF FROM THEIR DISTRESS.

(Read by Lord Chandos to the Buckinghamshire Agricultural Meeting, October 21.)

Wydale, Malton, Oct. 10, 1835.

MY DEAR LORD,—Each succeeding year, I am afraid, urges on us more and more the sad conviction, that there is no hope for the British farmer but in the united and unremitting exertions of all his friends. Those exertions, it is true, have hitherto signally failed of success; but failure in a cause like this, instead of breeding despair, should tend rather (as your Lordship, by your own conduct, has practically shewn,) to redouble our efforts, and stimulate our energies afresh. It is on the direction of our efforts for relief that I venture now to address myself to your Lordship; and for so doing, I offer no apology to one who has shewn so warm an interest in the well-being of the farmer. The session is over;—our Parliamentary labours have ceased for awhile;—yet, reaching our homes in the country, such is the picture of agricultural misery and depression spread before our eyes, it becomes our duty, instead of yielding to that quiet and repose so natural and so welcome to us all, after months of close confinement, —to be investigating the extent, the sources, and particular modes of the distress; and as friends of the farmer, to be preparing for the ensuing Parliamentary campaign. The principle object of this letter is to consult your Lordship, and also to throw out some suggestions as to the best means of concentrating the greatest amount of the agricultural strength in Parliament, on the first motion respecting agricultural distress in the ensuing session. In using the term agricultural strength I do not, of course, merely mean county members,—but all members representing constituencies engaged in production, which finds its principal custom in the home market—the great basis of which is agriculture. Now it appears to me that a very efficient, and at the same time a very simple way to concentrate our forces, would be—1st, to bring forward (unless under very peculiar circumstances) *only one motion* during the session but so worded, that it might embrace the conflicting views of all who are well affected to home industry.—2ndly I should propose, that this motion related to the causes which have depressed the agricultural interest. The existence of its distress has been already acknowledged: let the causes of it be as unequivocally expressed, and the farmer will then be no longer doubtful which side to join, or which set of opinions to support. Indecision, from an ignorance of the source of their distresses, has paralyzed the efforts of the farmer for relief more than any other cause. To be firmly united, they must be firmly convinced of the truth and the right for which they contend: and to be successful they must be united. To give it its full weight, your Lordship should be the member to introduce such a motion—and I sincerely, most sincerely, trust you will consent so to be.

Two or three motions were made last year relating to agricultural distress, chiefly by your Lordship and myself: the disadvantage of such an arrangement is, that members, not very earnest upon the subject, fancy they will satisfy their constituents if they vote once a session on distress; two-thirds perhaps vote for the first motion, the remaining third reserving themselves for the second motion, of which notice may have been given. Thus are our forces divided, and party politics win the day against the true interests of the country. It behoves us to provide a remedy for this evil: the remedy being either to secure such an addition of votes (and which are legitimately on our side) as will carry relief; or to shew the different distressed constituencies who are their friends and who are not.

In addressing your Lordship, I have taken it for granted, from the high position you hold on the question, that it is your intention to bring forward some motion respecting agricultural distress early next session.

In what shape you propose to do this I am wholly unacquainted; but if I have rightly interpreted your sentiments since the large majority against your motion for a repeal of the malt tax, you will not be disposed to attempt that mode of relief; and your late speech at Aylesbury confirms me in this view. Then with respect to any general reduction of taxation that is *within our reach*, especially after upwards of 40,000,000! has been reduced since the peace, and has left us in even a worse state than when the reduction commenced, we can scarcely hope for relief in that way. *Still less is a penny or two in the pound reduction in the county rates, likely to go to the root of the evil.* The farmers are daily becoming convinced that the evil is far deeper seated. Those in the county you yourself represent, have of late shown great anxiety on the subject of the cause of their disasters, and have unequivocally expressed their conviction, that the real bottom of the evil has been the change in the value of money; the diminution in the amount of the currency, arising out of Mr. Peel's bill of 1819. Those of the southern counties likewise, within the last two years, have been fast coming round to the same conclusion; and I can bear testimony that the northern counties are not behind in the same opinion:—an opinion which has been the result of increasing distress, and the total failure or inadequacy of the relief expected from other sources. At the same time I do not deny that there is a discrepancy of opinion among members of Parliament, as to the modes and chances of relief. This is the difficulty I seek to obviate, for in these differences only it is, that our weakness, as a body, consists. Under these circumstances would it not be wise that a motion should be made, in a measure, to comprehend the views of all the parties well affected to our agriculturist: and home industry, without offending the feelings or prejudices of any? and thus we should be able to concentrate our combined forces on a given point, and put into operation the "*pull all together,*" which can alone help us out of our misery. We are quite strong enough, if we be only united. *The relief of agriculture is anything but an unpopular question, except among trading politicians and philosophers. All the country towns, and a majority of the working classes, are in reality with us: they are as sick of the uncertain employment induced by bad profits, as they are of ingenious theories.*

In the event of your Lordship inclining to the line of conduct which has just been suggested, (and I do not think it would run counter to any of your views,) would you object to bring forward a motion worded somehow thus?—"For a Select Committee to inquire into the causes which have produced the long continued and still existing depression in British agriculture, with a view to their immediate removal." Such a motion, it appears to me, would be satisfactory to all our friends. No one else, I think, would be inclined to offer any other for the consideration of the House. I for one should not: but should be most content to fight (as indeed on this subject I always have) under your lordship's banner, under circumstances to command the greatest chance of success, in that great pitched battle, for the very existence of our agriculture, which must sooner or later be fought within the walls of Parliament.

In introducing a motion of this kind, it would not devolve on the mover, as an absolute necessity, to enter into currency or any other topic, to which there might not be a leaning in his own mind. Every one would see, by its very terms, that it was left open to any member to explain his own views. *It is only when concertment is desired* that it becomes necessary to place limits on the discussion of an inquiry into a subject like this. The committee you would be asking for would have the exposure of truth, and truth alone, in view—to which no honest man ought to object. When the truth was fairly exposed, and it could be no longer denied what the source of the distress really was, there would then arise another question of equal importance, but one in which the sufferers could much better help themselves at another election, viz.—*whether Parliament, knowing the source of the evil, and of its continuance, would consent to grant the relief required.* If it refused the relief, or if it knew its duty so little as to

allow the first interest in the country—the solid foundation of the prosperity of the whole—an interest with which twenty millions of our population are as closely identified as the plougher of the soil and the sower of the seed—if it knew its duty so little as this, I trust the constituents of the country know their duty better.

The melancholy fact, my dear Lord, is that our agriculture cannot go on as prices now are. Three-fourths of the arable soil in Great Britain cannot pay the expenses of cultivation at the present rate, much less leave a surplus for rent. A state of things like this is not only ruinous to the parties, but is dangerous to the institutions of the country. Men lose their respect for the government under which they live, in nearly the same degree as their interests are neglected and themselves forsaken by their rulers. Can it be our duty, at such a crisis, either as members of the legislature or as private individuals, to remain supinely tranquil and with our hands behind us? Surely not; on the contrary, every nerve should be strained, every effort united, without consideration of party politics, to effect a deliverance from our dreadful condition. The farmers, as a body, are worse off this year than last. I ventured a year ago to predict the present fall in wool, stock, barley, and oats; as the scarcity of them ceased, they were sure to fall to the level of wheat. I said that barley, if it were an average crop, would be below 23s per qr. In my own neighbourhood it sold last market for 21s. How fearfully has the anticipation been realized! And yet the harvest and crops have fallen far short of what were expected. Every market, notwithstanding, prices tumble down. Oats, 14s a quarter, which last year were 24s and 26s. Sheep unsaleable, and wool fallen 25 per cent! The only consolation for us is that the upland farmers and breeders will see that they are to form no exception to the general rule which has brought down their neighbours in thousands to the earth; under this conviction our numbers will be strengthened for the contest.

No better opportunity, therefore, has occurred for a cordial junction of the agricultural forces. I have even some hope that the landlords are rousing themselves from their apathy, alarmed for their property, now that corn wont pay its expenses—now that wool and stock, out of which, and which alone, rents have been paid for the last three or four years, are fast falling to a level with corn—now that the last shilling of their tenants' capital is gone. Half a century hence, who will believe the blind infatuation with which the landlords of this country have yielded themselves, hand-bound and tongue-tied, a prey to the crafty devices—the slow consuming poison administered by the political economists and the monied interest? The returns lately moved for by Mr. Dillwyn will also tend to dispel many delusions, and assist the inquiries and the conclusions of such a committee as has been suggested, and which, I fain would trust, under your Lordship's auspices, must now, from the urgent necessity of the case, be triumphantly carried, in despite of any Government, whether Whig or Tory, which, in the enjoyment of its own fixed incomes, and in the iron-heartedness of its power, should insultingly attempt to crush this righteous demand—this the last hope of the suffering farmer. I have the honour to be, My dear Lord, your very faithful servant,  
E. S. CAYLEY.

P.S. The objects of this letter being public, I shall not object to its publication. I can see no objection, but the contrary, to the whole country knowing our plans and determination to seek redress in the best way we can. It is a fair stand-up fight in which we have to engage. Relief, when it is carried, will be wrung from Parliament by no *coup de main* or cunning policy, but by imperious and acknowledged necessity. Publicly it will have this advantage,—it may be the means of bringing the minds of the farmers to some nucleus, and inducing them to urge a similar and simultaneous prayer to Parliament. *If we can only get the country gentlemen and farmers and provincial tradesmen to be unanimous, we shall soon see their representatives unanimous likewise.* Sufficient time will elapse between this and the next session, for communications to pass on this subject between the members and the constituencies.

## ON THE HUSK, OR HOOSE IN CATTLE.

TO THE EDITOR OF THE MARK LANE EXPRESS.

Sir,—About a twelvemonth ago, I sent you some account of this disease, which, as you considered of sufficient importance for insertion in the *Mark Lane Express* (for which I feel obliged) and as several other papers copied it from your columns, perhaps some further particulars attending it, which have come under my observation, may not be uninteresting to some of your readers, and may tend to afford, or elicit from others, additional information as to the cause and cure of this extraordinary disease.

I have this Autumn had another attack of the husk among my cattle. It made its appearance about the same time as last year, but did not prove so fatal in its effects. The symptoms were precisely similar, being, cough, with frothy discharge at the mouth, short breathing, weeping of the eyes, hanging of the head and ears, and continual inclination to rub (either on the ground or over a rail or fence,) the throat. About ten or a dozen cows and heifers were effected this year, but have all recovered. My weaning calves of this year were affected, but very slightly. The only remedies I applied in the present year were, making them inhale lime-dust, and spirit of Turpentine diluted and poured into the nostrils. But although I have taken considerable pains to ascertain the comparative merits of several remedies, particularly in the previous year, I am unable to speak very confidently as to the effects of any of them; all I know is, that in 1834 fourteen died and several others were so weakened and stunted from its effects as to be worth only about half what they would otherwise have been; and that in 1835, with similar treatment, all have recovered; and not only so, but when the disease goes off, those to which no remedy has been applied, appear to recover as well as the rest. It may be worthy of remark that the seasons in 1834 and 1835 were in this part of the country similar, both being dry Summers and growing Autumns.

At one time I thought the disease contagious, but from all I have been able to observe myself and learn from others, I am of opinion that it is epidemic but not infectious; that the cause is in the state of the atmosphere, as with the cholera\* and other epidemic diseases, and probably taken by inhalation.

One circumstance, which at first led me to think it contagious in addition to having numbers attacked about the same time was, that in each year, one of the fattening calves in the pens, where they had nothing but milk, became affected with a cough, and indications of consumption; but on examination when killed, I found the lungs ulcerated, but in both cases entirely free from worms.

Out of the fourteen which died in the previous year, 1834, two or three which had been as bad as any, but had rather stronger constitutions, remained in a dwindling state for some weeks after the disease had gone off from the others, and on examination, when they died, the worms appeared to have either died or left the lungs, but left them too much diseased and ulcerated from their ravages, for recovery. The head and throat of these were swelled previous to death, like those of a sheep in the last stage of the rot. I have found the cows have soon recovered when they have been housed, and fed on hay and grains, but this has happened to be about the time of year when the disease seems to go off naturally; so that this kind of diet may or may not have any effect on the disorder. At any rate, as dry food is recommended by some cattle doctors, it is worthy of further trial.

At the time the disease was at its height in 1834, Mr. Brown, surgeon, of Lewisham, who happened then to be attending my family, took considerable interest in the progress of the disorder, and examined the lungs and windpipe of one which had died. He found a few

\* Dr. Jenkins, in his Treatise on the Cholera, remarks that it rages most in seasons when the progress of vegetation is most rapid.

straggling worms enveloped in frothy matter, within the windpipe, which appeared either to have crawled or been coughed up; at the bottom of the windpipe, and throughout the main air vessels of the lungs were clusters of worms knit up together, sufficient in quantity to fill a common sized tea-spoon. The inner membrane at the lower end of the windpipe, was eaten away, and the lobes of the lungs considerably ulcerated. To the naked eye the worms appeared to be a sort of *Ascarides*, about as thick as a thread, and from an inch to an inch and a half long; on using a strong magnifying glass, they appeared about the size of a common eel, sufficiently transparent for us to observe the circulation of blood through their veins; and in shape pretty much like a leach; when first taken out they appeared rather dormant, but warmth seemed to revive them. The animal from which they were taken, had been dead about six hours. Mr. Brown appeared to doubt whether any remedies could be applied sufficiently strong to destroy the worms, without endangering the life of the animal, but recommended as an experiment, giving twenty grains of calomel and a little scammony, and make them inhale gas made from muriatic acid, manganese, and vitrol, similar to that used in fumigating apartments to prevent infection in fevers and other contagious diseases. These remedies I tried without any perceptible effect. In referring to an old work on cattle medicine, he found in the margin the following note. "Young clover will expel all kinds of worms in cattle."

In my former letter I mentioned several remedies which had been recommended by writers on cattle medicine and others; I will now enumerate some others which I have since met with: and so much from the proofs I have had of their efficacy, as for the purpose of affording an opportunity to the better judgment of others who may have their cattle affected in a similar manner, to select such as they think proper.

Mr. Clater of Retford, in his "Every man his own Cattle Doctor" says, "The Hoose or cough in cows and young cattle, proceeds from their taking cold either after calving, or from being kept in a warm hovel and afterwards exposed to the inclemency of the weather. The symptoms are shortness of breath; continual motion to cough or hoose—difficulty of respiration, which seems to press hard upon the diaphragm and abdominal muscles," and recommends the following drink—

"Balsam of sulphur, 2 oz.; Barbadoes tar, 1 oz.; 2 eggs; ginger, aniseed, cummin, Elecampare roots, grains of paradise, and liquorice-root, each 1 oz. in powder; salt of tartar,  $\frac{1}{2}$  oz.; honey, 4 oz.; given in ale or gruel, with a glass of brandy."

"Let this drink be repeated every other, or every third day, for three or four times. If it be at the commencement of the disease, one or two drinks are generally sufficient. When this disease is of long standing it is seldom removed without first a purging drink of 1lb of Epsom salts, 2 oz. of ginger, and 1lb of treacle."

The same author speaking of the "hoose in calves," says, "This disease most commonly attacks young calves the first year, while at grass in the summer. In some dry summers it has carried off large numbers. Upon examination after death, the author has frequently caused the gullets to be laid open, and found a bunch of worms netted or matted together. These, by their constant tickling motion, cause the young animal to be almost in a constant state of hoosing or coughing, by which the powers of digestion are so much injured, as to render the chewing of the cud impracticable; and if proper remedies are not applied, they languish and pine away like a consumptive patient. The following drink will be found effectual in destroying these kind of vermin.

Wormwood and savine, each two ounces; Indian pink, half an ounce.

Cut or bruise them small, and put them into a pitcher with a quart of boiling water; cover them down and let them stand till next morning, strain them through a cloth and add, ginger in powder, half an ounce; aniseed, fresh powdered, 2 oz.; linseed oil, 2 table spoons-full; mix and give it warm.

The calf must fast two hours before, and two after the drink. Repeat it every other, or every third day. This is a proper dose for a calf six or eight months old, and may be varied a little according to the age of the animal, and continued for three weeks, then leave off a week and repeat it again if the calf still remain unwell.

"Worms in horned cattle are not very common, except in the above cases. In many instances where calves have been so bad of this disease, as to baffle the power of other medicines, it has instantly given way on their taking one tablespoonfull of spirit of turpentine without being mixed with any thing. It may be repeated every third morning for three times."

Now by Mr. Clater's description of "opening the gullet," and "the powers of digestion being so much injured as to render the chewing of the cud impracticable," it appears to me, that he found the worms oosing, or swallow, or passage to the stomach, and not in the windpipe and lungs; and the remedies, such as wormwood, savine, &c., are such as are generally used for worms in the stomach and intestines, whereas on examination of those which died of mine, and which was done very carefully in almost every case, the stomach itself and the passage thereto was perfectly healthy and free from any kind of worms, and their appetites were good while they had strength to stand up to eat.

In the "Complete Grazier," this disease is treated on as follows:—"Cough:—When calves are exposed at too early an age to all the vicissitudes of the weather, before they acquire sufficient strength to undergo the changes of this climate, they are liable to take frequent colds, the consequence of which is, a cough that often proves fatal if neglected. For curing this malady, it has been recommended to pour half a table spoonful of spirit of turpentine into the calf's nostrils, the nose should be smeared with tar, and the animal kept within doors for a few hours, repeating this treatment as often as the cough becomes troublesome."

This work says nothing about worms, but treats it as a common cold or cough. Another remedy recommended is assafoetida dissolved in hot water, a quarter of an ounce at a dose every other morning, without food for an hour or two before and after.

Inhaling the fumes from burnt tar, and tarring the nostrils are also recommended. Mr. Cleeve, a friend of mine, near St. Albans, has just informed me, that a neighbour of his has found assafoetida, (I suppose the common solution) vinegar, and aloes, in equal quantity, and poured it into the nostrils, a most effectual remedy.

If it will not be trespassing too much on your space, and the patience of your readers, I beg to conclude by giving a short account of an experiment tried on a cow, when choked with a piece of Swede turnip, with complete success, by Mr. W. Moorey of Peckham to whose skill in the performance of the operation great credit is due. The probang and chock-ropes had both been used, but the shape of the obstruction was such that they both slipped by without removing it; the cow became hoven, or blown, as is generally the case by the efforts to swallow, and stabbing was had recourse to, which gave temporary relief and time for the operation: which was, to open the throat and ousing, and take out the piece of turnip, the outer orifice was then sewn up. The cow was kept for a few days on gruel and then turned out to graze. The only inconvenience which occurred afterwards was, that the food oozed out from the swallow through the incision before it grew up, and required emptying by cutting the stitches, which was done two or three times. This occurred last March, and I have the cow now quite sound.

I am Sir, respectfully your's,  
Lewisham, Nov. 16, 1835. GEO. COLGATE.

SINGULAR FACT.—Five thousand bushels of wheat have just been received in New York from Liverpool, which were shipped from that port in 1831. A sample was exhibited, which appeared to be in perfect order.—*New York Paper.*

## ON THE APPLICATION OF THE POINTS BY WHICH LIVE STOCK ARE JUDGED.—TO THE SHETLAND BREED, &c.

By MR. JAMES DICKSON, CATTLE DEALER, EDINBURGH.

(From the Quarterly Journal of Agriculture.)

The Shetland cattle inhabit the Shetland Islands. These form the northernmost group of islands belonging to Scotland. They have a barren and wild aspect when viewed from the sea, and their interior presents little else than pools of water and bare rocks; not a tree or a shrub is to be seen on them, and the herbage is as comparatively poor as their aspect is barren. The small islands, however, called the Holms, are covered with better pasture. But poor as the islands are, they contain a peculiar breed of cattle and horses both very diminutive in size. The cattle are comparatively valuable on account of the fine quality of their beef. Their symmetry is not quite correct according to the rule which we have laid down for judging cattle; the line of the back being rather hollow: the ribs are pretty round, the tail head droops, and the fore quarters and belly are fully too large. This form, which indicates starvation, may accordingly have arisen from the coldness and wetness of the climate, and the scantiness of food; for if we look at the kindly touch, the sleek soft hair, the fineness of the muscle, the fullness of the eye, and sharpness of the horn, they ought to feed pretty well; and, accordingly, they do feed fat on tolerably good pasture. Their colour is uniformly black, light red, or black and white. They are naturally the smallest breed of cattle in the kingdom, weighing generally from 16 stones to 20 stones the four quarters, and when extra fat from 25 stones to 30 stones. I have seen them fat at 14 stones or 15 stones. The beef is of the very finest quality throughout, being as small in the grain as mutton; the fat well intermixed, and the flavour most delicious. In fact, in point of quality, they are without exception the finest cattle that are bred in the kingdom. The cows are not great milkers; but the milk is very rich.

TO THE ORKNEY AND CAITHNESS BREEDS.—The Orkney Islands lie to the north of the coast of Caithness, which is the northernmost county in Scotland. The climate is cold, and variable, and late; but frost and snow continuing only a short time on the ground the grass gets leave to grow. The pasturage is better than in the Shetland Islands. The county of Caithness lies generally low, and having no high land to the north, to screen the low land from the strong north-west wind, which blows almost incessantly in spring, the grass cannot be expected to be early.

The cattle of Orkney, though much larger than those of Shetland, are much less symmetrically shaped, and not so fine. The back curves above the straight line, and is narrow; the ribs are flat; the hind quarters thin; all the bones coarse, and those in the body prominent; the head droops, and the horn short and blunt. Their general symmetry and poor coat indicate them to be slow feeders, and incapable of early maturity.

The Caithness cattle are not unlike the Orkney. They have narrow backs, flat ribs, and as a natural consequence, large bellies, and narrow chests. Many of both the Orkney and Caithness cattle are trained to work, and are kept till above seven or eight years old, when they are sold quite lean, and fattened off afterwards. They are then called "runts," a Scottish phrase which technically means "an old cow that has given over breeding,"—a phrase not inex-

pressive of the old useless appearance of this breed of cattle. I have seen these runts bought for very little money; but nevertheless they pay the feeder well, because having age, they feed rapidly on good pasture, and the beef is pretty good. A great many of them are exposed for sale at the Kyle of Sutherland market, and thence driven south to the Scotch and English markets.

Many spirited agriculturists have of late years greatly improved both the cattle and the face of the county of Caithness. There is much turnip land in this county, which being sown with turnips enables the feeders to feed their own flock. Many of the fattest beasts find a ready market in Caithness in summer during the herring fishery. This species of national industry has increased so much in this quarter, that perhaps not fewer than 30,000 people are employed in it annually on the coast of Caithness. The fishermen make good wages, and are able to live well on butcher meat.

Should steam navigation be introduced for the conveyance of live-stock from this quarter of the country, the breeders will be enabled to feed off all their stock, and send them direct to the Edinburgh market, instead of exposing their lean stock for sale, or depending only on the immigration of fishermen in summer, for the principal consumption of their fat stock.

Improvements have chiefly been effected by stewards brought on purpose from the south country, or south country farmers taking farms in that part of the country. The Messrs. Horne of Stirkoke and Langwell have Berwickshire stewards, who have set examples of management to their neighbours. Mr. Traill of Ratter is one of the most spirited improvers in this county. Mr. John Patterson, in what is called Lord Rae's country, now the property of the Duke of Sutherland, has made great improvements at Leangill.

TO THE NORTH HIGHLAND BREED.—In the counties of Sutherland and Ross are many breeds of cattle. The native breed is called "North Highlanders," which are scarcely distinguishable from the cattle of Orkney and Caithness; in East Ross and Cromarty, is found the large breed of Banff and Aberdeenshire; and in many other parts the "West Highlanders" are found. Of the West Highland breeds, the breed from the island of Lewis, belonging to Ross-shire, is a smaller breed than the runts of Orkney and Caithness, and it possesses very little if any better symmetry or quality. But the Dunrobin West Highlanders form the pride of Sutherlandshire. They are bred by, and belong to the Duke of Sutherland at Dunrobin Castle; hence the name.

The Dunrobins are well known both in England and Scotland as superior West Highlanders. They attain to great size on the pastures of Dunrobin, which are considered as fine grazing land as in Scotland. I remember a lot of sixty four-year olds being shewn about twelve years ago at the October Falkirk Tyrst. They had the most sprightly and splendid appearance of any north country cattle I ever saw. They shewed beautiful symmetry, straight level backs, round deep carcasses, great substance of flesh, strong fine bone, fine coats of hair with small muzzles, quick eyes, and large sharpe pointed spreading horns. The only fault which could have been found in their symmetry was the large proportion which the force bore to hind quarters. They were fine fat, and would have weighed fifty-five stones the four quarters, and were purchased by the late Mr. Henry Lee of Scateraw in East Lothian, an eminent feeder of cattle, for 13 guineas a piece. Mr. Lee sold them by public sale some months after,

when they averaged about 23/ a-piece, as they were considered very superior animals in every respect; but on being killed they did not prove well. They wanted weight, quality, and fat to their appearance, and turned off very large hides. I have heard it maintained, that the large hides and horns evinced, that they had a dash of Irish blood in them. In these respects, they certainly did resemble the Irish; but not at all in the general appearance. I have seen a lot of cows and young cattle of the same breed on the farm of Skelbo, belong to the Duke of Sutherland. These I considered equal to the Dunrobin cattle. Skelbo is an excellent management. It had been improved by the late Duke as a pattern and stimulus to his tenantry. It is situate on the side of Little Ferry, and carries excellent crops of corn and turnips. I understand that Sir William Watkins Wynne of Wynesty in Wales, purchases three-year old Dunrobins every year, and uses them for his own table after feeding them two years. The last lot of that age I ever saw sold was for twelve guineas each.

A small breed of cattle called "Skibos," are bred on the property of Skibo in Sutherlandshire, belonging to Mr. Soper Dempster. They are nearly as small as the Shetlanders, but much more symmetrical and beautiful, and nearly as fine in quality of beef. The tenants on the property of Skibo have the privilege of driving those which they have to dispose of for payment of rent, to the estate of Dunnichen in Forfarshire, a property which belonged to the late celebrated George Dempster, "the honest Scotchman," as he was familiarly called by George the Third, but now to Mr. James Whitshed Hawkins, to dispose of by public auction. Thither gentlemen from all parts of the low country go to the annual sales, and give exorbitant prices for these small creatures, to fatten for the use of their own tables. Skibos are exceedingly neat, having straight level backs, pretty round ribs, small bone, sharp muzzle, keen bright eye, and fine small sharp-pointed spreading horns, with a soft thick hairy coat, and sweet touch; they possess most of the good properties of a fast feeder. Looked on from above downward, they are rather narrow, and perhaps long, for their breadth; but when extra fat they cover the tops of the ribs well, and show remarkably fine points. The beef is of the finest quality. These annual sales take place in the beginning of October. After being kept two winters and a summer on good keep, they attain to the weight of from thirty to thirty-five stones; and if kept for another year, they may be forty stones. The drove consists of from 200 to 300 stots, never queys, of two and three year olds, and a few older; but the youngest fetches the highest proportionate price; and of all the colours of black, red, dun, and brindled, the black and red coloured are generally the best feeders, and the most symmetrical. The prices given at these sales are quite fanciful.

The horned cattle in East Ross and Cromarty, though like the horned Aberdeenshire, are rather smaller, and something like the smaller sized runts, and the best of them might feed, if very fat, to fifty stones; but their ordinary weight runs from thirty to forty stones. Great numbers of cattle might be fed in this district, as it is one quite suitable to corn and turnip husbandry, but ready markets being situate at a great distance, raise a barrier against their being generally fed, although many of the lots which are driven to the south are in prime condition. There is a spirited farmer who farms extensively in East Ross, Mr. Archibald Dudgeon of Arboll, from East Lothian, who feeds a good many sheep and

cattle, which he brings to the Edinburgh market once a-year, about May, from a distance of upwards of 200 miles. I have seen him show very superior sheep of different breeds, but the distance is too great for heavy cattle to travel without injury. What an advantage would steam navigation prove to Mr. Dudgeon and others similarly situated, as a means of conveyance to a ready market like that of Edinburgh! Although the district is well adapted for feeding, it will never become an important one as such without the assistance of steam navigation, which in this quarter should be conducted in a particular manner. To use a steamship to advantage in this quarter, the supply should be confined to the Edinburgh market, for the want of cheap coals in that part of the country precludes the possibility of a profitable voyage to London. Driving the cattle to the London steamers at Aberdeen would knock them up when ripe fat nearly as much as to a greater distance in a leaner condition. But even under present circumstances, breeders preparing stock for dealers or feeders in the south, never can put them in too high a condition. They may depend upon it that they will be repaid for extra keep, as high condition will never be found fault with by dealers. On the contrary it will be appreciated, though from no other consideration, than that good condition enables an ox to travel well; and if well driven, much of the firmer part of the condition will remain, though part of the softer portion must of course be lost in the driving.

The North Highlanders are found in the counties of Caithness, Sutherland, Ross, Inverness, Cromarty, and Nairn.

TO THE ABERDEENSHIRE BREEDS.—There are various breeds of cattle in the county of Aberdeen; but the kinds which more properly belong to it are three,—the polled cattle of Buchan, called Buchan doddies, the large-horned cattle of Aberdeen, and the small-horned or Bræe cattle of Aberdeen.

The Buchan doddies are an esteemed breed of cattle. They are generally symmetrical; the back being straight, and nearly level, but having the top of the rump and the tail-head a little too much elevated; ribs roundish, being a little flat near the back bone. The side view is pretty rectangular, the deviations occurring by the brisket being deeper than the flank, the rump and tail-head being higher than back and shoulder tops, and being a little light at the buttocks. When viewed from above, the back is a little too narrow, and is wedge-shaped from the hooks to the shoulder. They have a good eye, and are generally good handlers, having a strong boned frame, capable of carrying much beef, which, when ripe, is placed pretty well upon the best points. Their colours are generally black, sometimes red, dun, and brindled, with scarcely any white. Their appearance indicates substance of muscular flesh and gaiety of disposition. When fed they attain from fifty stones to sixty stones at four years' old, and some even to seventy stones or eighty stones, and in some instances 100 stones at five or six years' old. The beef is of fine quality, adapted either for the cutting up or the shipping butcher, particularly the latter, and it is always in demand for that purpose, and they find their way to every part of the south country. I once had an opportunity of seeing at Cartel Haugh Show, near Old Deer, some fine specimens of bulls, cows, and heifers. There are always some fine lots of these doddies shown at Aiky and other fairs in that neighbourhood. The last time I was in Smithfield market I saw a lot of twenty very fine Buchan doddies, which had been bred and fed near Peterhead. They fetched 23/ a-piece, and were

of as good quality as any cattle in Smithfield that day, and were early sold. They had been conveyed from Aberdeen to London in a steam vessel. This mode of conveying fat cattle to the London market is an invaluable privilege to breeders and feeders in that part of the country. Indeed, it will there entirely change the prevailing mode of managing cattle. Instead of keeping them in a lean condition for two or three years in order to prepare them for travelling by age, they will be fattened on the spot, and sent off to London. To accomplish this desirable end in a short time, and thereby insure a quicker profit, they should be fed from the moment they are dropped. This improved method of feeding will cause the cultivation of a greater breadth of turnips, and perhaps potatoes. Bone-dust will secure an abundant supply of the former; and when the London market is at command, the London prices will repay for extra feeding. Captain Barclay, in Kincardineshire, Mr. Stronach in Aberdeenshire, and Mr. Miln, of Mill of Boydnie in Banffshire, send fine well fed cattle to London.

The Brae breed of Aberdeenshire cattle is a middle-sized horned kind, of pretty good symmetry, and rather plain skinned, but they are favourites with the graziers in Aberdeen, Banff, and Morayshires, as they are clever travellers, and seldom exceed in weight from thirty stones to fifty stones when fat. They also cut well up for the retail butcher. Morayshire is not a great breeding county, the graziers purchasing these brae cattle at the markets in East Ross and Cromarty. These brae cattle are well suited for wintering on half turnip and straw, and feeding off in summer on grass. Their beef is of fine quality, and, from their moderate size, they are much liked by butchers for summer killing. I have frequently observed that no beef is better mixed, or cuts better up.

In the interior of Aberdeenshire, towards Huntly and Keith, and through many of the low-lying grounds elsewhere, is a large horned, heavy breed, called runts. They have large frames, strong bones, long legs, a gaunt appearance, smooth hair, large hooves, and the top of the head surmounted with very thick, broad long spreading turned up horns. The colour is generally black, with some patches of dead white about the belly and face. The muzzle is thick, and the eye dull and heavy; they stand high on the legs, are long in the body, and have great ends and small middles. They attain to fully as great weights as the Buchan doddies. Many are worked in the plough till seven or eight years of age, and then sold to be driven south or fed at home. Some of these cattle are bred by the Duke of Gordon, Earl of Aberdeen, Earl of Kintore, Earl of Aboyne and others.

The show of the Highland and Agricultural Society, which took place in October 1834, at Aberdeen, clearly proved that the Buchan doddies are displacing these large horned runts; and no doubt properly, for they are a finer breed of cattle. There was a considerable display of bulls and cows of the doddies, and but a few of the horned breed. This change in the breed is ascribed to a change of management of cattle during the winter in this district. Formerly all the cattle were housed in winter, and it mattered not whether they had horns or not, for they could not injure one another when each was separately tied up; but now it is found better for their health, and the preservation of their travelling condition, to feed them in straw yards; and as hatred and envy are their besetting sins, the doddies are less likely to gore one another than the horned, although even they can "give each other

plaguy knocks," but not, as in the prize ring, "with all the love and kindness of a brother." The superior kindly disposition of the doddies to fatten is of itself a sufficient inducement to warrant the change. A considerable quantity of butter and cheese are manufactured in Aberdeenshire, for the Buchan cows are good and steady milkers, although the milk is not very rich. The curing of beef, for which the heavy cattle of Buchan are well adapted, might be successfully prosecuted in this quarter.

While alluding to the subject of salting beef, I cannot refrain from making a few observations on the quality of the salt which is in this country used for that purpose. It is well known that the salt manufactured in this country from sea water is bitter and harsh to the taste. The rock-salt also is not devoid of the bitter taste.

The salt from St. Ubes, or what is called bay-salt, is somewhat similar, though not so pungent. The salt, on the other hand, which is manufactured from sea-water in Holland, has not the slightest bitterness or harshness to the taste. It has a pleasant pure saline taste. It is crystallized in large tables, is quite hard and dry, and emits a jingling sound when handled in quantity. It is said that the Dutch possess some secret in purifying the salt after it is made and to prevent this being made known, they will allow no strangers to visit this department of the salt works. It has been suggested to bring a Dutch purifier of salt from Holland. But if there is really any secret unknown in this country the Dutch government would not likely permit such an exportation. Now it is well known that in making salt from sea-water, the salt which is made on Sunday is very like Dutch salt, because on that day the water gets more time to evaporate. So that if more time were taken to make salt from sea-water, it would probably be as good as desired. As the process is at present conducted, the difference in the taste of the Dutch and British salt is obvious in the curing of butter, and no substance will retain a taint in its manufacture so strongly as butter. The Dutch butter retains its butyraceous flavour after being salted, and although it will keep untainted as long as desired, it has the taste of what fresh butter would have on being eaten with salt; whereas the British salt butter of commerce tastes as if it had been pickled in bitter brine. There is as much difference between these two states of butter as between fresh beef eaten with salt and salted beef. There is no art in preserving butter from a putrefactive taint by immersion in brine, as herrings are usually preserved; but there is a difficulty, it seems, to salt butter in this country, so as to retain its delicate flavour like the butter of Holland, at least it has never been attempted by the butter curers. Now this difficulty cannot arise from the quality of the butter; for as delicate and rich butter can be and is made in Britain as in Holland: the difference of taste, then, in the two kinds of butter, must be ascribed to a difference in the quality and use of the salt. But why need there be a difference in the salt, when the Dutch make salt from the water of the same ocean? This is the question. There is no doubt that the bitter taste of our salt arises from a salt of magnesia which is probably not driven off by the quick evaporation used in producing common salt, for we have seen that the Sunday salt has no bitter taste, and it must therefore have no salt of magnesia. Slow evaporation would thus get quit of the evil. It would get quit of it both from sea-water and rock-salt. Salt being so bulky and so low-priced an article, a large quantity must be disposed of it to repay the labour attendant on its manufacture. I suspect the above

difficulty of obtaining pure salt lies in this consideration. No analyses, then, of the Dutch salt, however ingenious, can discover any other thing than the absence of the salt of magnesia, and we know already by our sense of taste that salt does not exist in it. Till, therefore, a method is discovered of extracting or neutralising the salt of magnesia during the process of quick evaporation, for time will not be allowed for a slow one, we must be content to use an inferior article to the Dutch.

Dutch salt consists of three varieties, a very large crystallised, a smaller crystallised, and a fine crystallised. The whole is purely saline, and free from bitterness; so all the three may be used for preserving butter, and beef, but the finest is used for preserving butter, being mixed intimately with the mass. The larger is used for curing meat and it is admirably suited for that purpose, the large crystals melting slowly in the tub, the pickle is supplied slowly to the beef, which absorbs no more of it than is requisite for its preservation; and the beef is thus preserved tender; whereas the forcible introduction of salt into beef, in the shape of brine, hardens the fibre of the meat, and renders it dry by the displacement of the natural juice, and the bitter principle of the salt injures the flavour of the meat. The pure saline solution, gradually supplied by the large crystals, preserves the meat from putrefaction, but without injuring its texture or neutralizing its flavour. It would therefore be of national importance to take time and render our salt as innoxious as that of Holland, particularly for the preservation of that delicate article—butter.

TO THE ANGUS BREED.—This is a polled breed of cattle, and are technically called "Angus doddies." They are like the Buchan doddies on the one hand, and the polled Galloways on the other. They form an intermediate breed as to external characters. This breed has been much improved to what it once was, most probably through the intervention of a cross with the Galloway. Thirty years ago Lord Kinnaird, the grandfather of the present nobleman of that name, brought bulls from Galloway to cross with Angus cows to his farm of Idvies, now the property of Mr. Henry Baxter, advocate, in the central district of the county; others followed the same course, so much so that it is questionable whether a dodded Angus beast can now be found without a dash of Galloway blood. The characters of the generality of Angus cattle are these:—back depressed a little over the loins, the rump and tail-head a little too high, and the top of the shoulder a little below the level line; the buttocks too thin, and the brisket not forward enough. Looked from behind and before, the body is not broad enough, the hook-bones being too narrow, the ribs flatish next the back, and the hind and fore legs too close together. Viewed from above, the breadth across the shoulder narrower than across the hooks, the body being a little wedge-shaped. The legs are of moderate length and well-boned; the muzzle a little coarse; the eye good; the ears a little too thick and hairy: of course the head is hornless, but tufted with hair, and the whole pretty well shaped, though not pleasantly set on the neck, which is rather too small at the onset of the head. The hair is short and smooth, the hide thickish, and the touch, though not harsh, not sweet. General colours, black, black with a few dead white spots on the belly and face, dark red of a dull and rich hue, and yellow red. These characters indicate a quiet disposition, and rather slow feeding. The common breed is capable of great improvement. Such of them as are in the possession of Mr. Hugh Watson of Keillor, the Messrs Mustard, Mr. Bowie of Mains of

Kelly, shew how blood,—a refinement in the tone of breeding,—can be attained in any breed by judicious care in the crossing with the same kind. But even yet the breeders of Angus cattle cannot with certainty depend on like producing like, the true criterion of a finished breed.

Mr. Watson has bestowed for a long time much trouble and care in selecting a beautiful stock of cows and bulls. In consequence he has shortened the legs, beautified the symmetry, rendered the coat finer, and the touch sweeter, and improved the points of laying the beef on best parts. He has shewn some fine specimens with these improved characters, particularly a pair of four and half year old oxen at the Highland Society shown at Perth in 1829; and a heifer of the same age, a most extraordinary animal for quality and substance, and weight in proportion to her height. Her brisket was only eight inches from the ground. I understand that she was sold for 50*l* in London, whither she had been sent at the request of the Highland Society. Her fore-quarters weighed 74 stones, and the tallow was equal to the weight of a quarter. Mr. Watson also shewed a pair of oxen, of the same age, at the Highland Society show at Kelso in 1832. These were considered by judges superior to the pair shown at Perth, and perhaps they were the best oxen of the breed that ever appeared. They were afterwards slaughtered in Edinburgh, and turned out 105 stones the four quarters. There is a remarkable appearance, though not a very pleasing one which a very fat Angus beast exhibits, the smooth glossy skin appearing as if it were quite stuffed out to the full stretch.

Were the breeders in Angus to bestow half the attention which Mr. Watson and a few others bestow, the breed would soon display a different appearance in point of quality. It ought to be a pleasure to any breeder to possess animals of the finest quality. But too many are afraid to lay out a few pounds on a good bull, and would rather employ any one that can only get a cow with calf, and buy every sort of calf that is polled that comes in their way. Nay, they will even buy a horned calf, if cheap enough, and make it polled by a cruel operation of extracting the embryo of the horn. This random mode of breeding makes very unequal lots of cattle when brought into the market. They are so unlike one another in appearance and value, that the purchaser invariably points out the worst animals in the lot, by which to depreciate the value of the rest. In some respects these breeders are like the Irish farmers who will not winnow, but will obstinately persevere in selling the light corn and chaff along with the better grain. They of course always receive a low price. In like manner, these breeders will not assort their lots to suit the taste of different customers; they will not break their lots, as they call it, for the purchaser must take the whole overhead, rubbish and all, or want them. And, as to the breeding of bulls, no selection is generally made, the calf of a cow which is a great milker, if it happen to be a bull calf, is sure to be kept for a bull, regardless of the bull that got him, though he should not have one single good point on him. Now, no mistakes can be greater than those, and no injury is so hurtful to the breeder as that arising from the use of an inferior bull. A good bull may get a good calf by a very inferior cow; but an inferior bull can never get a good calf by any cow. This holds good in every breed of cattle, and more strikingly in an inferior breed. I once saw a short-horned cow which had, by chance, been bred by a very ugly North Highland bull; the calf (a quey,) was black, though the cow was a beautiful roan, and it was fed till three years old. The same

cow had a heifer calf, the following year by a short-horn bull, which was fed for two years. Both were sold at the same time; the two-year-old fetched 13*l*, the three-year-old only 10*l*, besides losing one year's keep. These remarks are not intended to apply only to the breeders of cattle in Angus, for I know other counties in which this careless system is pursued much more systematically than in Angus; but that being a fine country for breeding, both by soil and husbandry, it is not unreasonable to expect a better system to prevail there than in poorer districts.

There is an immense number of cattle fed annually in Angus, and there is no breeding district which contains such a vast flying stock, many of the cattle bred in the north being fed off in this county. In the spring months more than one-half of the Glasgow market is supplied from this county, to the amount of three hundred head a-week. Some of the feeders fatten from 50 to 200 head of cattle in winter. The principal feeders are Mr. Watson of Keillar, Mr. Dalgairns of Ingliston, Mr. Kirkaldy of Fullerton, Mr. Mill of Woodhill, Mr. Inches of Cardean, Mr. Farquharson of Baldovie, Messrs. Proctor of Glamis. The age of feeding off is generally four years, and some of the best, which are sent to Glasgow, weigh 60 or 70 stones. Many of the feeders in Angus do not breed at all, and they either purchase for themselves, or from dealers who select lots among the cattle in Aberdeenshire. Mr. Peter Watson at Kirriemuir frequently dealt in this manner, and I have known him get 20*l* a piece for Aberdeenshire cattle to be fed off in Strathmore.

The Angus cattle have extended over the whole county of Kincardine, and a large portion of the south of Aberdeenshire, to the exclusion of the large horned breed, for similar reasons to those already given for the partiality of the Buchan breed. They have also found their way in many parts of Fifeshire. Large droves are annually sold to English dealers in the great markets in the county, at the Falkirk trysts, and at All-Hallow Fair at Edinburgh, who graze them and send them onwards, as they attain condition, to the English fat markets, and ultimately to Smithfield. They almost always pass in England under the denomination of Gallo-ways, or if fed in Norfolk, they are called Norfolk Scots.

### THE IPSWICH PLOUGH.

"I hope that one of the consequences of this ploughing match will be, to show the farmers that it is not the best mode of economising their means to make four horses and two men just do the work which might be done by two horses and one man."—*Lord Stanley's speech to the Liverpool Agricultural Association.*

TO THE EDITOR OF THE MALDSTONE GAZETTE.

SIR,—Amongst the important benefits of the newspaper press, is the facility it affords for the immediate discussion of those matters of interest that from time to time occur. In your remarks, in the last *Gazette*, upon the ploughing match of the Rochester and Gravesend Agricultural Association, when alluding to the two-horse plough exhibited there, you appear, though not a farmer, to be well aware of the importance of ascertaining the comparative merits of two and four-horse ploughs, and kindly offer your columns for discussing the subject. I avail myself of the offer to provoke enquiry, whether four horses are necessary to plough the greater part of the land in this county? an enquiry particularly called for at this period of agricultural depression.

Many years ago I adopted, and have continued to

this time, the use of Ransom's plough, but my example has not been followed,—a notion being entertained that the Kentish plough only was adapted to Kentish land, and whenever the two-horse plough was mentioned, the remark was, "*It cannot plough the land.*" This observation is no longer made, for after two exhibitions of its powers in competition with upwards of thirty turn-wrist ploughs, drawn by the most powerful teams in this neighbourhood, and managed by the most experienced ploughmen and drivers,—it is reluctantly admitted that *it can plough the land.*

The difficulty of overcoming prejudice is proverbial, and fresh objections are started to this simple and efficient implement. It is urged that the use of it does not admit of a less number of horses being employed. It might as well be said that if the land were ploughed by steam, the same number of horses must be kept for the other purposes of the farm. There can be no doubt but that the ploughing of every acre of land with double the requisite number of horses, is done at double cost to the farmer.

Another objection is, that the seam made by the light plough is not sufficiently deep to bury the seed. Admitting this objection to be valid, it can only apply to grain sown upon the furrow; but the fact is, that in nine cases out of ten, the seam of the Kentish plough is obliterated before sowing, by a favourite operation in this country, called *creasing*. The seam left by that ploughing which you witnessed was intended to be so effaced. But this objection is of no force, as there are thousands of acres of land, in other counties, sown upon the seam left by the Ipswich plough.

These are the objections now made to the two-horse plough, and which I think must be admitted to be trifling. In combating them I have sometimes referred to my own crops, in proof that no injury necessarily attended its use, but it has been said that these afford no criterion, on account of their being so highly manured.

Whilst thus advocating the merits of this plough, I readily admit that the only objection to the turn-wrist is its great waste of animal power, and consequent loss to the farmer. No plough can do its work better, and there is one kind of soil—that in which large flints are imbedded—where it excels all others, as from its great weight and steadiness it forces its way through obstructions which would break or throw out lighter ploughs. This soil is, however, at the present low price of corn, scarcely worth tilling, and is comparatively of small extent. Upon all the other land in Kent, the two-horse plough is, in my opinion, fully sufficient.

I have thus, Sir, thrown down the gauntlet in defence of the two-horse plough, which I should not have had the courage to do, if hundreds of spectators had not witnessed its performance two succeeding years, at the ploughing matches of the Rochester and Gravesend Association. It is possible that these ploughing matches, instituted for the encouragement of the labourer, may ultimately materially benefit the farmer, by directing his attention to an implement, the use of which would enable him to plough his land at half the present expense. I remain, Sir, your obedient servant,

Hermitage, Nov. 11, 1835. THOS. BENTLEY.

VEGETATION.—M. Reum, in a treatise on vegetation, while he enumerates the causes which act upon it, mentions that of minerals. First, he says, that plants never fructify in distilled water; then that a root which meets with a pebble in its progress under ground, turns itself round it, and is much injured if detached from it; and in Wirtemberg, when a willow is planted, a stone is put in with the slip to make it grow stronger and faster. He adds, that when a tree appears to languish, heaping stones all round it will frequently cause it to recover: and if one or two roots be planted, and charcoal dust be put in the hole with it, and the other be inserted with powdered talc round it, the latter will succeed much better than the first. Plants always thrive best in soils oxydized by iron, such as basalt, porphyry, &c.

## ROYAL BUCKS AGRICULTURAL ASSOCIATION.

### PUBLIC MEETING AT AYLESBURY.

A meeting of the members of this association was held on Wednesday, Nov. 25, at the George Inn, Aylesbury, to receive the report of the deputies of this association, appointed to meet those of other agricultural associations, and to consider the steps which the agriculturists ought to take in the present aspect of their affairs. One of the principal resolutions of the meeting of deputies was, it will be seen, repudiated by the Bucks Association.

The MARQUIS DE CHANDOS was unanimously called to the chair. The noble lord expressed his great anxiety that this meeting, and all others coming in contact with any deputations from associations of other counties, should strictly confine themselves to the question of agricultural distress, and not mix up that question with that of any alteration of the currency. If the currency question were mixed up with that of agricultural distress, he felt convinced that the consequence would be a total defeat in the House of Commons. He was happy to find that this opinion of not making a change in the currency identical with relief of agricultural distress, was supported throughout the country by those who expressed themselves publicly, and the private opinions which he had received from many quarters confirmed him in the prudence of the view that he had taken. Upon the subject of the currency he had never given an opinion, and he begged still to decline doing so; but he wished most emphatically to impress upon the minds of the landed proprietors, and farmers present, and upon the minds of all, who, through the medium of the press might peruse on account of their proceedings, that if the two questions were pertinaciously mixed up together, one result would be the inevitable consequence, viz., that to prevent the appearance of giving the slightest indirect encouragement to a change in the currency, the question of agricultural distress itself would be thrown overboard by the House of Commons, and the farmers would then be completely ruined. In his opinion the best line of policy which the agriculturists could adopt was to move for a committee of the House of Commons to inquire into the causes and trace out the sources of agricultural distress, of the ruin of the farmers, and how those evils could best be remedied. Having been before defeated on a motion for a repeal of the malt tax, he would not again bring forward that question, for he did not wish to place the agricultural interest on any question in a minority in the House of Commons. He was at all times glad to devote his best efforts to the landed interest, and he hoped that their proceedings that day would be unanimous, and that the persons forming the Royal Bucks Agricultural Association would show by their example that they had at heart the interests of the farmers throughout the country. (*Hear.*)

MR. MEDLEY (a banker at Aylesbury) stated, that 110 members of parliament were of opinion that, when entering into the subject of agricultural distress, the state of the currency must be taken into consideration, and expressed his regret that the noble lord then in the chair had refused taking upon himself the presidency of the "General Agricultural Association." If he did not consent, he was afraid they would be obliged to apply to another noble lord.

The MARQUIS DE CHANDOS said he was afraid he could not alter his original determination not to become president of the General Agricultural Association.

Sir W. YOUNG, M.P., wished to know whether, by receiving the report of the proceedings of the meeting, when the association was honoured by the presence of deputies from various other agricultural associations, they, the members of the Bucks Association, were to be considered as personally bound by the resolution of the meeting of deputies? (*No, no.*)

The MARQUIS DE CHANDOS—Certainly not.

The Secretary then proceeded to read the resolutions adopted at the meeting of deputies. On coming to

that which related to propriety of forming a Central General Agricultural Association in London.

Mr. R. PARKER objected to the constitution of a central agricultural union in London. His principal ground of objection was, that such a union would cause a discrepancy of opinion between the different parties now seeking to remedy agricultural distress; and the second ground of his objection was, that this union would give rise to a good deal of additional expense. He was of opinion that the county of Buckingham having been the first to take up the cause of agricultural distress ought to stand alone, and not be in any way a party to the formation of a central union in London.

Colonel PIGOTT was of opinion that it would be better to leave the General Agricultural Association to be formed of deputies from different provincial associations. They would find it more beneficial to hold their meetings in some large central town in one of the midland counties of England than in London.

A LANDED PROPRIETOR, whose name we could not ascertain, agreed with those who attributed the non-relief of the agriculturists to a want of union among their partisans, and that union would not be brought about by the formation of a permanent association in London, and he therefore concurred in the opinion expressed by Mr. Parker.

Mr. MEDLEY totally disagreed with the whole of what had been stated by the three preceding speakers. If their opinion were to be adopted, no relief could be obtained for the distress of the agriculturists. He insisted, from the strongest grounds of conviction, that the county of Buckingham of itself could do nothing, and that, by uniting with a general association in London, they could do every thing they pleased. He regretted to see that the landed aristocracy and gentry were disunited in their opinions upon this question. If union were essential, and all admitted that it was, there could be no point of union which offered so many advantages as London, where, during the session, all the members of parliament were congregated, and with which the greatest facility of communication existed. The agriculturists ought to place themselves in such an attitude as to be enabled to lay before parliament at one view a combined and explicit statement of the evils which afflicted the agriculture of the kingdom generally; for unless they could agree in a description of the nature of their sufferings, how could they expect parliament to agree in devising a remedy for them? The present union of the agriculturists was in effect little better than disunion, each party taking their own peculiar view, and asking relief after their own peculiar fashion. But if they were really and truly united, the consequence would be that they would sow dissension amongst the ministry, and that would give them all they wanted. Being of this opinion, he hoped that the formation of a general association in London would meet with the unanimous approval of that assembly.

Sir W. YOUNG, M.P., in reference to the plan of general combination amongst the agriculturists of England, which was first publicly broached at the meeting at Framlingham, and since at the meeting of deputies at Aylesbury and elsewhere, said that he felt the strongest objection to the formation of any regular board, union, or combination of deputies of this description. His objection was mainly founded on the unconstitutional nature of such a combination. Indeed the legality of it was very doubtful. He was an enemy to political unions of all kinds, which he thought inconsistent with the regular and ordinary administration of government; and, being thus opposed to political unions, he felt himself bound to, in consistency, to state his objections to that which was, in fact, a political union, for the avowed purpose of accomplishing certain and specified objects. He principally objected, however, to that part of the plan of the union which makes it a permanent body; and he for one would most positively decline taking part in the proceedings of any union, either in London or elsewhere, which assumed to itself the character of a permanent body. (*Hear, hear.*)

The Rev. Mr. YOUNG said that the General Association was intended to be purely an Agricultural Association, and that, of course, its object was merely the

discovery of a remedy for the distress under which the agriculturists now laboured. However, he could not see any reason why they should make it a permanent association, nor why, if permanent, they (the members of the Bucks Association) need entangle themselves with any of its other schemes. They were all agriculturists, and they ought to unite, and give as much effect as they could to the formation of this association in London, which they could do without, as it appeared to him, in any way compromising their independent existence as a separate and distinct society. (*Hear.*)

Mr. MEDLEY said that a memorial had been sent to the King that very day, inviting his Majesty to become Patron of the General Association in London; and when such was the case there was, he was sure, no cause to fear that the association was formed for political purposes, or that it was justly open to the objections that had been started respecting its legality.

Colonel PIGOTT again entreated them not to repudiate this resolution, which had been agreed to at the late meeting. He urged them to remember how all important it was to them that the friends of agriculture should be banded together in one strong body, and of what injury it might prove to their hopes that even the semblance of disunion should be exhibited by them.

The resolution for joining the agricultural union in London, which was carried at the meeting of the 12th, was then put, and lost there being 10 for and 17 against it.

The Marquis of CHANDOS then said the reason he refused to become the Chairman of the Central Board was, that he considered he could better discharge his duties towards the farmers of Bucks by attending entirely to their interests. He felt greatly the honour that had been conferred upon him by the offer made to him by the Central Association, but as he considered that by not accepting it his sphere of usefulness might be less limited, he had respectfully declined it.

Sir W. YOUNG said that he, as well as the Marquis of Chandos, had been invited to attend the Central Association, and in common courtesy he did not think they could altogether decline attending a meeting of such importance. For his part he should attend it, without pledging himself as a consenting party to anything that should be expressed or done by the order of this central board.

The Marquis of CHANDOS said he would attend the meeting in London, but he should do so simply as a private individual, as he considered it would be a great want of courtesy for any person belonging to the Bucks Association to refuse attending the meeting, which was to take place in London. He would attend it solely for the purpose of giving information, without pledging himself to any resolution which might be adopted by it.

A resolution which had been proposed at the meeting of deputies by Mr. Spooner, and agreed to at that meeting, respecting the proper standard of value, was then read, in which it was then asserted that nothing but an alteration of the currency could save the farmers from ruin.

Mr. BARKER moved that the resolution be rejected. He did not wish to give any specific opinion as to the effect of the currency upon agricultural distress; but as he thought that every petition to government to devise means for removing the present distress of the agricultural interest ought to be unaccompanied with any mention of the currency question, he moved the rejection of the present resolution.

Mr. MEDLEY said that the farmers were blind to their own interests—that they should go to the root of the evil, and that was the state of the currency.

Sir W. YOUNG said, that though he agreed with the original resolution, he did not wish to mix up the question of currency with that of agricultural distress.

After a few words from the Rev. Mr. Pigott and Mr. Manby, the original resolution was rejected, their numbers being 15 against it, and 8 in favour of it.

The Marquis of CHANDOS then said, since this resolution had been passed, he wished to know whether the association considered him bound by it, as to the course he might pursue in the House of Commons? (*No, no.*)

In the House of Commons, he should move for a committee to inquire into the state of agricultural distress, without himself giving any opinion as to the cause of it.

Mr. MANBY, and several other gentlemen, said they did not consider the Marquis of Chandos bound by the present resolution to any vote that he might give in a committee of the House of Commons on the subject of the metallic question.

The meeting then came to an unanimous resolution, that it was due to the interests of the British farmer, that a system of poor laws should be immediately introduced into Ireland.

A vote of thanks was then passed to the Chairman, and the meeting separated.

## TO SIR WILLIAM YOUNG, BART., M.P.

448, West Strand, London, Nov. 27.

DEAR SIR WILLIAM,—This morning's Herald contains a speech of yours at Aylesbury which has grieved me much, because, if your view of the subject be correct, mine must be wrong in urging the formation of a Central Association. Had you favoured the deputations at Aylesbury with the views developed on the 25th, we should then have been prepared to discuss the subject, and I should most indisputably have demonstrated that I had no *political* and most certainly no *personal* object in view, for I have already given more of my time and money (speaking relatively as to their value) to procure relief for the agricultural interest than any other individual in England. The resolution passed at Aylesbury, negating that adopted by the deputations, is so unfair towards Mr. Broun and myself, that were it not that we have higher objects to regulate our conduct than any paltry feelings of jealousy, I for one would leave the farmers to find advocates of their interests, who, however much more able than myself, could not be more disinterested. I rejoice however to find that other counties do not display the same spirit as Bucks, and that Lord Wynford (one of the highest lawyers England ever had), Lord Farnham, Lord Gage, &c., and other noblemen and gentlemen, have cordially seconded our efforts for the removal of a distress which the local sources have failed to accomplish, and which your own experience in parliament must have convinced you can only be obtained by a union of the proprietors and occupiers of land—a union which at present even your own association does not present.

P.S. Allow me to express my gratification that you have avowed yourself in favour of a conjoint standard of silver and gold, but my letters this morning from Aylesbury indicate a contrariety in your proceedings on the 25th inst.: for although you negated by a small majority (17 to 10) the resolution passed by the assembled deputies at Aylesbury on the 12th inst., for joining the Central Association, yet you appointed a deputation of five members to attend the general meeting in London at the Freemason's Tavern on the 15th of Dec., when I trust I shall be enabled to prove that no political views can or ought to be associated in a cause so hallowed as that of procuring relief for agricultural distress—a sentiment which I doubt not you will cordially concur in.

I beg to remain, very truly yours,  
R. M. MARTIN,

To Sir William Young, Bart., M.P.

## CENTRAL AGRICULTURAL SOCIETY.

TO THE EDITOR OF THE MARK LANE EXPRESS.

Sir,—With reference to an observation made in the letter addressed to you by the Editor of the *Buck Herald*, commented upon in your leading article of last week, viz., that "in the name of certain associations, I had proposed to the Marquis of Chandos, the chair of the proposed Central Association," permit me to remove

an erroneous impression which appears to have gone abroad, with regard to the resolution moved by me at the Meeting of Deputations, at Aylesbury, on the 12th inst., for the purpose of divesting the nascent "Royal Agricultural Society of Great Britain and Ireland," of all party objects and feelings, and to procure for it the support of all who have a stake in the soil, whether they be Whigs or Tories, Liberals or Conservatives. It is proposed that the society, when finally organized, shall, (like the "Highland Agricultural Society of Scotland") be under the direction of a president, vice-presidents, directors, and committees, to be chosen *annually* in rotation, from its members. Such being the case, I did not propose that Lord Chandos should become the chairman (i. e. president) of the society, but I submitted a resolution to the effect that, his lordship should be invited to become the chairman of the provisional committee for organizing it. The meeting unanimously resolved that Lord Chandos *should be invited* to become the chairman of the provisional committee. That resolution will be laid before the deputations, when they assemble in London on the 14th of next month, to arrange the proceedings for the general meeting on the day following; and if approved of by them, the resolution will then be communicated to Lord Chandos, when his lordship will have it in his power either to accept or decline the request made by the agricultural body.

Sir William Young, at the meeting at Aylesbury, on Wednesday last, expressed an opinion that the central society would border too nearly on a political and un-constitutional society, for him to give it his support. Whether Sir William has gathered his opinions of the central society, from the pages of the *Morning Chronicle*, or *Courier*, I cannot say, but I hope I do not violate the confidence of a private letter in stating that Lord Wynford, whose opinion as an eminent lawyer, will have due weight, cordially approves of the formation of the Society, has signified his intention to be present at the Meeting on the 15th December, and that he shall be ever ready to promote the objects of that meeting by every means in his power. Sir William's opinion as to the illegality of the society is only the echo of an opinion expressed to my coadjutor, Mr. Montgomery Martin, some time ago, in Downing-street. But upon the same principle the Highland Society should be put down, the Bucks Agricultural Society should be put down, the Royal Society should be put down, and every other society that has for its objects the advancement of the intelligence, the industry, and the happiness of the nation.

Though a small number (17 to 10) of the Bucks Agricultural Society has negatived the resolution, which was, I believe, carried unanimously by the deputies from the other counties who met at Aylesbury, that it is advisable that a Head Society, as a centre of communication for the Local Societies, be formed in London, (whilst at the same time Lord Chandos, Sir William Young, and Messrs. Grenville Pigott, T. S. Harcourt, Medley, Rolfe, and Brickwell, were appointed a Deputation to take part in the proceedings on the 15th Dec.) still I have no fear that the Central Society will be formed, and formed upon principles, and for objects, which no honest man will hesitate to support. Too long has it been the policy of all classes of society to act in opposition to the advice of one who has devoted a long and useful life to speed the plough, viz., "that Agriculture is the GREAT ART which every government ought to protect, every proprietor of land to practise, and every inquirer into nature to improve." In seeking that this great art, by which the nation is nourished and sustained, shall receive the protection of the government, shall be practised by every proprietor of land, and improved by every inquirer into nature, the promoters of a National Agricultural Society propose I hope nothing for which they may be ashamed to throw themselves upon the kindly feeling, and the good sense of their countrymen.

In addition to the Societies approving of the formation of the Central Society, enumerated in your paper of last week, letters have been received from the Bridlington Association, stating that, at a meeting of that

body, held on the 14th instant, very numerously attended, it was unanimously resolved to support and co-operate with the Central Society; also from the Thirsk Association mentioning that at a general meeting held on the 16th, it was resolved that the Central Society will be of the greatest utility to the agricultural interest, and that it do receive their cordial support. Communications approving of the same object have been received from East-Kent, Mid-Kent, Brigg, Ashby de la Zouch, Sudbury, &c. Various noble Lords, Members of the House of Commons, and landed proprietors, have also during the last week sent in their adhesion to the Society, and letters to the same effect are daily being received.

With many thanks for the able assistance which you have rendered to the cause in which we are embarked, I remain, Sir, faithfully yours,  
R. BROWN.  
448, West-Strand.

## PETITIONS TO BOTH HOUSES OF PARLIAMENT.

Prepared at a meeting of the Committee of the York Agricultural Association on Thursday, Nov. 14, on the subject of agricultural distress, were laid for signature in the outer Merchants' Hall. The following is a copy of the petition to the House of Commons, which is similar to the petition to the other branch of the Legislature.

*To the Honourable the Commons of the United Kingdom of Great Britain and Ireland, in Parliament assembled.*

The humble petition of the owners and occupiers of land, and persons interested in the prosperity of agriculture, residing in the county of York.

Sheweth,

That your petitioners belong to the most numerous, and most peaceful class of his Majesty's subjects.

That their patience has been unexampled, amid distress unparalleled.

That no effectual steps have hitherto been taken by Parliament to ascertain the real nature and causes of their distress, now of near 20 years continuance, occasionally suspended by vicissitudes of seasons and visitations of Providence.

That they lament to think, that during this long period, the ear of Government, on matters connected with home industry, has been lent to political adventurers and theorists, and the monied interest, rather than to those who have a solid and permanent interest in the productive welfare of the country.

That your petitioners are at a loss to conceive why, in an age of improvement, not only the grievances of the most important interest in the empire; but the very worst of grievances, viz.—penury and ruin, should alone go unredressed.

That the depression has at length arrived to a pitch, which, under the burden of our fictitious debts and engagements, can no longer be borne. A considerable extent of the arable soils in England at the present prices can pay neither their expenses, nor rent.

That it is impossible, that evils of the magnitude under which your petitioners suffer, can have arisen without an adequate cause; that cause, uninquied into, has, indeed, been sometimes attributed to the operations of bountiful nature, for the purposes only, according to the views of your petitioners, of preventing the exposure of the truth; it is in vain attempting to remove an effect without previously ascertaining the cause.

Your petitioners, therefore, earnestly entreat your Honourable House, in no spirit of party, but in the spirit of consulting the country's best and most lasting interests, and in strict justice to British agriculture, "the first of all its concerns," at once to institute a bold and unflinching inquiry into the causes of agricultural distress, with a view to their immediate removal.

And your petitioners will ever pray, &c.

### THE FAILURE OF THE TURNIP CROP.

Sir,—The general failure of the turnip crop, through the southern and midland counties, as well as partially in the East-Riding, has produced considerable anxiety; and it is attributed to a black caterpillar, in the former places, and to the excessive drought of the months of July and August, in the latter. In the North-Riding, the principal crops have looked pretty well until the commencement of the present month, when they changed their beautiful green, and healthy appearance, for a diseased yellowness, and dying of the primary leaves. Being informed by a respectable turnip-grower, that the turnips were much infested with the maggot-grub, I examined the bulbs of some turnips in a field where they looked remarkably healthy, and to my surprise, I found that the fibres attached to the bulb, were thickened to nearly the size of a finger, and as many as nine were thus unhealthily enlarged, at a single root. This disease is, I believe, the same as is designated in some districts, by the somewhat uncouth appellation, of "fingers and toes;" so that it will appear that the North-Riding has not altogether escaped the effects of the season. Knowing this unnatural appearance to be the result of some diseased action, I carefully preserved some of the tubers, and dissected them; but examined several, before I could discover any thing but an apparently sound enlargement of the fibre, and no maggot-grub nor any traces of such insect ever being there, could I discover. I, therefore, adopted a different plan; I broke some of the tubers which were somewhat approaching to putrefaction, in two, and found some minute white worms, with black heads, about the thickness of a fine needle, and very much resembling the young of the common earth-worm, in its first state. In order to ascertain whether they were, or not, I immersed one in salt-water, knowing that the touch of salt will destroy a worm in a few minutes; but it seemed only to have acquired new life by this application, which did not otherwise affect it. I had my suspicions that these were the young of the wire-worm; and by taking up a root with the earth by which it was surrounded, I found several wire-worms attached to the unhealthy parts, and the defects they left, after eating the plant, were precisely similar to those left by the worms in question, only much larger in extent. There is a grub which attacks the bulb itself, and raises small tubercles upon those parts of it which are exposed to the air, but which never seriously affects the health of the plants. In order to be certain that the two kinds of grub were different, (although their appearance at once decided that,) I put both to the test of quick-lime;—it destroyed this maggot-grub in five minutes, while it produced no sensible impression upon the wire-worm in twenty. I now considered I had gained a point; all my doubts that it was the larvæ of the wire-worm were dissipated, and then the enlargement of the fibres are easily accounted for. The wire-worm attacks them, and deposits its eggs under the cutis of the fibre, which causes an extravasation of the juices, and something analogous to a fungus deposit, takes place, which of course arrests the growth of the plant, and takes for its maintenance the juices, which otherwise would have supplied the plant. It may be asked, what practical information do my examinations afford? and I answer, they have elucidated the cause of a disease, which has hitherto been unexplained, at least, so far as

my agricultural reading extends; it has therefore, added to our knowledge, and left the way open to other experimentalists, to devise a cure. But it has done more; it has proved that salt will not destroy the grub;—lime will not; and by subsequent trials, I find that soot, and sulphur, are alike ineffectual. By way of conclusion I may say this disease in its most virulent form, will grow the turnip out of the soil, when it will separate itself from the tubers, and die away. There are (from my own observation) two kinds of wire-worms, one yellow, and slightly resembling a caterpillar, but perfectly smooth; the other quite straight, and its colour white. These worms are remarkably agile, and very tenacious of life. Those beautiful birds, the Water-Wagtails, are great destroyers of them, as well as Sparrows, but the former are much more expert at the business, being running birds, and much quicker in their motions, than the latter, which can only hop. I once witnessed an instance of sagacity in these birds, which will be interesting to the naturalist. The Wagtails were following the plough very close, and catching the wire-worms, with which, as soon as they had got their little bills full, they flew away. The sparrows watched them, and as they flew, darted at them. The Wagtails in their fright dropped the worms, and the Sparrows instead of pursuing the birds, flew down to the ground and secured the worms.—Yours, &c.,

Thorpfield, Oct. 26, 1835.

### QUANTITY OF SEED.

(From Sinclair.)

**OATS.**—The quantity of seed for a crop of oats, is generally from four to five Winchester bushels per statute acre; though in Devonshire even eight. The amount must depend upon the richness of the soil, and the variety that is cultivated. The potatoe-oats not having any tail-oat, like the ordinary sorts, and tillering well, require much less seed, in point of measure, than the other sorts; and may be safely trusted, when the land is equally well cultivated, with as small a quantity of seed as barley, namely, from two-and-a-half to four bushels. It is, however, to be observed, that as oats in general are cultivated on weak and inferior soils, and in cold climates, the quantity of seed should be increased in proportion as these circumstances operate.

**BEANS.**—In the culture of beans, different quantities of seed are used in England and Scotland. In the former, three bushels per acre are considered to be a sufficient quantity, if drilled, and four when broad cast; but in Scotland, four bushels are required when the beans are sown in drills, and five bushels when sown broad-cast. Perhaps this may be partly owing to the difference of climate, beans being sown early, and exposed to much severity of weather. Besides, it is maintained in Scotland, that unless the rows of beans close effectually over the land, weeds will unavoidably grow, and flourish, after the cleansing process is finished. The land will thence become foul, so as to defeat the very object of the drill husbandry; the crop will be proportionably injured, by being robbed of its nourishment, and the soil will be left in a wretched condition, compared to that in which it ought to have been placed.

**PEAS.**—When drilled four bushels of seed are considered to be sufficient, but when sown broad-

cast, from four to five bushels are supposed to be necessary. Much, however, must depend upon the size of the pea, the luxuriance of its growth, and the peculiar qualities of the variety sown, for three bushels of the grey pea, as seed, are found equal to four of the white.

**CLOVER and RYE-GRASS.**—It is not advisable to sow at the same time, a mixture of light and heavy seeds as clover, and rye-grass. It is impossible that it can be done correctly; and it is much more prudent, to go once over the ground, with each sort of seed. The usual quantity per statute acre, is from ten to twelve pounds of red clover seed, and about a-half or two-thirds of a bushel of clean and well dressed rye-grass seed. If the rye-grass is cut young, it is not injurious to the soil.

On the whole, seed ought not to be distributed with too rigid economy, as a full crop of any grain whatever, is cheaply purchased, by giving a sufficiency of seed; while a scanty crop, besides being in itself unprofitable, is sure to poison the land, by facilitating the growth of weeds. There is a happy medium, however, in this, as well as every thing else. For a crop may not succeed, when the plants are too numerous in the ground, any more than when they are too few. Their over luxuriance may likewise be prejudicial, by retarding the ripening, and hazarding the safety of the crop.

## EFFECTUAL METHOD OF DESTROYING THE FLY IN TURNIPS.

TO THE EDITOR.

In May or June, 1834, a letter signed "Agricola," was copied by the *Chelmsford Chronicle* from the *Entomological Magazine*, detailing a variety of experiments in proof of the eggs of the turnip fly being deposited on the seed. Of this fact, any person may satisfy himself, by using a strong magnifying glass; a microscope will, of course, shew them better. In order to destroy the vitality of the eggs, the author of the letter steeped the seed for twelve hours in salt and water, but this long period destroyed the seed; he then tried three hours steeping, and was successful in saving his crop of turnips, but the insect still appeared. In a report of the proceedings of the Hunkford Agricultural dinner, this discovery and remedy is attributed to Mr. Fulcher: surely he must have been the author of the letter to the *Entomological Magazine*. I have carefully repeated the experiments of Agricola upon every description of turnip seed, some of which did well with salt, but others were more or less injured. I then tried lime, lime and salt mixed, and arsenic, but with no better success, the insect still appearing, and many of the plants sickly and withering. My attention was then directed to find a substitute for the salt, which should not be injurious to the seed. Knowing that alkalis were generally beneficial to vegetation, I made a solution of common washing soda and water, in which the seed was steeped but a short time. The young plants shot up with surprising rapidity, and were soon out of harm's way; the insect was still there, but it was powerless. These facts were communicated to Messrs. Tetterells, of Plum Hall, Colchester, who have used soda for several large fields on their three farms, on the Mersea road, with unvarying success; their crop of turnips is unrivalled in Essex. These gentlemen are known to be practical farmers, and will be ready to show their fields to any person who may be desirous of "seeing

with their own eyes." It may be asked how the young plant escapes injury whilst the insect is upon it? By close observations of many trials, I am of opinion that the seed leaf is impregnated with the soda, giving it an unsavory relish to the insect, as I observed hundreds of them tasting the leaves and soon jumping to others, where meeting with nothing more palatable, continue the search for more agreeable food for hours. I have watched them, and not seen a single plant destroyed, whilst every one has been more or less tasted. If it be objected that wheat or other grain steeped in arsenic or lime does not convey either into the stalk or ear, it must be remembered that the turnip fly, (or beetle more properly,) only attacks the *seed leaf*, which is, in fact, the root of the young plant, supplying it with nourishment until the rootlets strike into the earth, then the true leaf appears and the plant is safe. Messrs. Tetterell dissolved four ounces of soda in ten quarts of water—this was sufficient for twelve quarts of seed, which absorbs a great portion of the solution in about three hours; it was then put into a bag and allowed to drain twelve hours, at the expiration of that time every seed had germinated: the sowing followed immediately. I have only to add, that whatever merit there may be in this discovery is due to "Agricola." I am Sir, your obedient servant

Abberton.

INQUIRER.

## WEST SOMERSET AND TAUNTON AGRICULTURAL ASSOCIATION.—CATTLE SHOW.

The Annual Exhibition of Live Stock took place on Friday, the 27th of November, in the Castle Green Yard, which was attended by a great number of the Gentry and Yeomen of the neighbourhood.

### THE DINNER.

In consequence of the room at Sweet's Hotel, not being spacious enough to contain the number of persons intending to dine (so rapidly has this association increased in strength and importance) Miss Sweet, anxious that all should be accommodated, hired the Assembly Room, where upwards of 130 sat down to a very sumptuous dinner provided by her for the occasion. B. ESCOTT, Esq., in the chair, supported on his right by Sir T. B. Lethbridge, Bart., and on his left, by F. Popham, Esq. Among the company, we noticed E. B. Portman, Esq., Dr. Blake, E. A. Sanford, Esq., M.P., Rev. T. S. Escott, V. Reynolds, J. Snowden, Esqs., T. Gould, Esq.,—Gordon, Esq., Robert Mattock, Esq., Rev. W. P. Thomas, Col. Cooper, A. Crosse, Esq., Revds. W. Wood, W. Fenwick, and W. Chilcott, Capt. Maher, —Byrns, Esq., G. Bucknell, Esq., V. Laugworthy, B. Lamont, Esqs.—Perry, Esq., J. Bunter, Esq., H. J. Leigh, Esq., and a large number of very influential agriculturists. Mr. T. D. Coles filled the Vice-President's chair.

After the usual loyal toasts—the "The Navy and Army," "The Bishop and Clergy," &c., &c., the healths of several gentlemen present were drank, and the following gentlemen addressed the meeting:—Colonel Cooper, the Rev. T. S. Escott, the Rev. W. P. Thomas, the Rev. W. F. Chilcott, Dr. Blake, E. A. Sanford, Esq., Sir T. B. Lethbridge, Mr. Portman, Mr. Coles, Mr. Popham, Mr. Hamcock, the Rev. W. Wood, Mr. Somers, Mr. Crosse, and Mr. H. J. Leigh. As the speeches generally bore upon the same subject, which was more fully discussed at the meeting next day, and we omit them for the purpose of giving a more full report of the proceedings which then took place.

The following premiums were then awarded.

Premium given by E. A. Sanford, Esq., M.P., for the best ox, owner's own breed, Mr. John Bult, Dodhill.—Premium given by C. J. K. Tynne, Esq., M.P., for the best cow and offspring, Rev. W. Wood,

Staplegrave.—Society's premium best fat ox, Mr. H. Brown, of Stawel.—Best breeding cow, Mr. C. Gibbs, Bishop's Lydeard.—Best fat heifer, Mr. E. Bond, of Oak.—Society's premium, bull, Mr. J. Bond, jun.—Heifers under 22 months, Mr. J. Bond, Bishop's Lydeard.—Fat wether sheep, Mr. T. Bond, Bishop's Lydeard.—Breeding ewes, Mr. I. D. Coles, Pyrland.—Boars, Mr. Colman, Hoveland.—Sows, Rev. W. Wood, Staplegrave.

The premiums were awarded to labourers, &c., in Agriculture, as follow :—

The premium of two sovereigns to William Vinsom, of Brompton Ralph, for having supported the largest family by his own industry.

The premium of one sovereign to John Stone, of Yarcombe, for having supported the largest family with the least parochial aid.

The premium of one sovereign to William Gallop, of Pitminster, having worked the longest time, viz., 45 years, on a farm occupied by a subscriber.

The premium of one sovereign to John Chidgey, servant to Mr. Edward Bond, having lived with him nearly eight years, with a good character.

Sheep-shearing Premiums, adjudged, May 27th, 1835, presented Friday, 27th Nov., 1835.

- 1st Premium—3 sovs. to John Williams, of Creech.
- 2nd do ..... 2 do. to Wm. Chester, of Stogumber.
- 3rd do ..... 1 do. to George Fudge, of Kingston.
- 4th do ..... ½ do. to Henry Harper, of Cheddon.

The Premiums for Rams were awarded,

- 1st Premium—3 sovs. to Mr. Hancock, of Hales.
- 2nd do ..... 2 do ..... do ..... ditto ..
- 3rd do ..... 1 do. to Mr. J. D. Coles, of Pyrland.

Ploughing Match, 21st Oct., 1835.

- 1st Premium—2 sovs. hat and favour, J. Anning.
- 2nd do ..... 2 do. to Thomas Birch.
- 3rd do ..... 1½ do. to James Forward.
- 4th do ..... 1 do. to Herbert Harper.

5th.—A premium of two sovereigns to James Fry, being the best manager in the class which had won the highest prize at former ploughing matches.

**AGRICULTURAL DISTRESS. LARGE MEETING OF LANDHOLDERS AND FARMERS IN SOMERSETSHIRE.**

An unusually large meeting of landholders and agriculturalists, was held at Taunton, on Saturday, Nov. 28th, for the purpose of deliberating on the means of relieving the prevailing distress in agricultural life.

At twelve o'clock it was found that the number of persons present required a much larger space for the meeting than could be afforded at Sweet's Hotel, where they had before met, and again intended to assemble. Permission having been obtained for using the Assize Hall for the purpose, the *Nisi Prius* Court was in a few minutes filled in every part, presenting a body of between six and seven hundred persons, many of whom consisted of the most opulent landholders and farmers of the county.

JOHN GOULD, Esq., of Amberl House, was requested to take the chair, and he very kindly consented to undertake its duties. After a few appropriate remarks on the object of the meeting, and the necessity of permitting every gentleman a fair and uninterrupted hearing,

A. Crosse, Esq., rose to propose certain resolutions which he had very unexpectedly been called upon to submit to the meeting. After stating that the present state of the markets defied all chance of remunerating the grower, the expense of producing an acre of wheat being at least 5*l.* (Mr. J. Hancock, begged to correct the speaker, by observing he was prepared to show it could not be cultivated for less than 6*l.*) and showing that on the best lands the average produce afterwards

would produce very trifling, if any rent whatever; the worthy gentleman enforced the objects of the meeting, submitting his resolutions. In most of them he cordially concurred, but in those which adverted to the policy of enlarging our circulating medium, by an issue of government paper, he candidly confessed his misgivings of opinion. Mr. Crosse in the course of a long and sensible address, adverted to the exertions of Sir T. Lethbridge, in ameliorating the condition of the farming interests, and felt happy in the opportunity of expressing his opinion, that the hon. baronet never advanced a sentiment to the truth of which his feelings did not conscientiously respond, or ever contemplated an action of the duty and honour of which he did not previously feel perfectly satisfied, (*Cheers and applauses.*) After considerable expatiation on the object of the meeting, Mr. Crosse proposed the following resolutions.

Mr. Crosse then submitted the resolutions, which will be found at the end of this report, with the addition of a clause advocating a revision of the currency, but which the meeting rejected on Sir T. Lethbridge's amendment.

Mr. J. HANCOCK, in seconding the resolution, observed that the present low price of the produce of lands was in such a state as to bring ruin and loss on all occupiers, as well as on many of those who farm their own estates. He would read to the meeting a statement which related to land of a superior quality, that is the average of a mixed farm of arable, meadow, and pasture, of the best farms in the Vale of Taunton Dean. The rents of these now averaged about forty shillings per acre, from which it will be perceived, that the lands of the best quality, after paying rates, taxes, manure, labour, blacksmiths, carpenters, and all expenses relating to the outgoings of a farm, leave but a very small rental; consequently farms of a second rate quality do not pay their expenses, and those farms of an inferior quality are at present worth nothing. If there be any error in this statement, he considered that it was on the favourable side of the landholders, having made no allowance for bad seasons, for harvest, and failure of other crops, which is particularly exemplified in that of the failure of the turnip crop this year (on which his loss this season was at least 300*l.*) A great portion of the land in the Vale of Taunton Dean is very much injured by the high hedges, and the large growth of timber trees in those hedges, preventing a free circulation of air, harbouring birds, and laying the corn very much from wind and rain previous to the harvest near the hedges, which occasions at least two bushels per acre deficiency on the average. In illustration of his statement, he had presumed land to be in a fair state of cultivation, and to be kept so, which is the paramount duty of all landlords, so that their farms are kept by manure and good management in a fair state of husbandry; and to take a just, fair, and moderate rent, according to the very depressed state of agriculture (that is the very low price of farming produce.)—The expense of the five following crops taken to commence at Michaelmas, in a fair state of cultivation, on one acre, yearly :—

The expense of an acre of wheat, on the average, of the best farms.

	£	s.	d.
Ploughing headlands, furrowing up, and drawing out, per acre .....	0	6	0
Lime and carriage 15 hogsheads per acre, imperial measure, at 2s 6d per hhd. ....	1	17	6
Ploughing, dragging, rolling, harrowing in the seed per acre, sometimes ley wheat and sometimes fallow .....	1	0	0
One year's parish rates .....	0	6	0
Seed wheat, 2½ bushels per acre, at 5s per b. ....	0	12	6
Tithes in general .....	0	12	6
Weeding, per acre .....	0	1	0
Reaping, harvesting, and thatching .....	0	12	6
Thrashing, winnowing, and carriage to market .....	0	16	0
Interest of money for one year .....	0	7	0

Without rent.....£6 11 0

2nd.—Crop of turnips out of wheat erish, £ s. d.

From four to five ploughings, at 6s 6d per acre	1	8	0
Dragging, harrowing, and rolling, after every ploughing	0	10	6
Throwing up the dung to heaps in the court- ledges, and turning per acre	0	1	0
Drawing out the dung (10 loads per acre), at 1s 6d per load	0	15	0
Spreading, per acre	0	2	0
Seed and sowing	0	2	0
Hoeing and weeding, per acre	0	5	0
Parish rates	0	6	0
Tithes	0	5	0
Wear of gates, hurdles, fences, &c.	0	3	0
Interest per year	0	7	0
	£4	4	6

3rd.—Barley crop.

Two ploughings, at 6s 6d per acre	0	13	0
Dragging, harrowing, rolling, and healing the seed after each ploughing	0	8	0
Seed barley, 4 bushels per acre, at 4s per b.	0	16	0
Sowing barley and grass seed, per acre	0	0	6
Grass seed, per acre	0	9	0
Parish rates	0	6	0
Weeding and repairing fences	0	2	0
Mowing, harvesting, and thatching	0	10	0
Tithes at 3s bushels per acre	0	11	0
Thrashing, winnowing, and carriage to market	0	8	0
Interest, per year	0	7	0
	£4	10	6

4th.—Crop of young grass.

Parish rates	0	6	0
Weeding and fencing	0	1	0
Tithes	0	5	0
Interest, per year	0	7	0
	£0	19	0

5th.—Second grass.

Parish rates	0	6	0
Tithes	0	2	0
Weeding and fencing	0	1	0
Interest, per year	9	7	0
	£0	16	0

Outgoings brought forward:—	£ s. d.	Incomings or produce:—	£ s. d.
1st. Wheat.....	6 11 0	By 25 bush. wheat	
2nd. Turnips ....	4 4 6	per acre at 5s..	6 5 0
3rd. Barley ....	4 10 0	— 1 acre of tur-	
4th. Young grass.	0 19 0	nips, at 3l ....	3 0 0
5th. Second ditto.	0 16 0	— 35 bushels bar-	
		ley, at 3s 6d..	6 2 6
		— 1 acre young	
		grass .....	3 10 0
		— 1 ditto second	
		grass .....	2 0 0
Without rent	£17 1 0		£20 17 6

So that to balance the outgoings, there remains about 15s per acre rent.

Mr. Hancock being an extensive and experienced farmer, and of great respectability, the above exposition of facts was listened to with great interest by the meeting.

F. FALKNER, Esq. addressed the meeting to the following effect:—Mr. Chairman, I cannot but express my great satisfaction at seeing so very numerous and respectable a meeting of the landed proprietors and farmers of West Somerset, assembled for the purpose of expressing their sense of the very severe distress which presses upon the agricultural interest; and with the determined purpose of seeking for some efficient relief. I do not hesitate to say, sir, that a meeting upon a more important subject never took place within these

walls; for if properly considered, it well be found to involve not only the welfare of the farmer, but of all the other classes of the community. As the produce of the land is the source of all other property, agriculture cannot long remain in a state of great depression without deeply affecting all other interests. It is painful to dwell upon the disastrous consequences that have ensued from the distress which has of late years fallen upon the agricultural portion of society. Thousands have been utterly ruined, and have sunk into the grave the victims of disappointment and despair; whilst vast numbers have been degraded to hopeless poverty, or driven into exile. Many causes have been assigned for the great changes in prices which have produced these calamitous effects: but there is but one principal cause, the alteration in currency on the quantity of circulating medium by the return to cash payments at an old standard of value; by which money obligations of every kind were doubled in their pressure upon the people. Such was the want of foresight on the part of parliament when that measure was carried into effect, that it was affirmed by the advocates for the measure, that prices would but be very inconsiderably affected by it. And their assertions were relied upon in preference to those of others who maintained that it would produce the ruinous consequences which we are now experiencing. It is truly lamentable that a matter of such immense importance to the welfare of the country as the monetary system should be so little understood by those who undertake to regulate it, and should be made the subject of such rash and ill-considered experiments. It is most evident that no very profound thought was bestowed upon the subject, by those principally concerned in passing that memorable act called "Peel's bill." For, when it was declared that every one of their 800 millions of pounds which constituted the public debt, should be represented by a quarter of an ounce of gold, it was in fact determined that the pound should be equal to five bushels of wheat, which that quantity of gold will buy upon the Continent on the average of years; and that the prices of all other commodities should be in proportion. This must be evident to every man who is acquainted with mercantile transactions, and takes comprehensive views of the subject. No corn laws or other restrictions on our foreign trade, will bar this consequence on our home prices; though they may for awhile, as they have done, delay the full and final effect. Prices, therefore, must subside to the level of those of foreign nations generally; and when that shall have taken place, how is our present enormous burthen of taxes to be supported? What rent can be paid for land when wheat shall be 4s per bushel, and other produce in proportion? If such be the effect of our present money system, and such I maintain it is, I am warranted in saying that there is no hope for the farmer. Two years ago a committee of the House of Commons was appointed to inquire into the distress of agriculture, for the purpose, I suppose, of suggesting some mode of relief, but those who composed that committee were strictly prohibited by certain influential persons from taking the subject of the currency into their consideration; and every attempt to do so was promptly suppressed. Why, sir, to what can we compare such conduct as this, but to that of a physician, who, having called in others to consult upon the case of a patient in extremity, insists that they shall pay no attention to the pulsations of the heart, the action of the liver, the condition of the lungs, or the state of the digestive organs; but with these restrictions requests them to enter upon the consideration of the unhappy patient's disorder. I feel very confident that the state of the currency is the seal of the present disorder of the farmer's affairs, and that none of the topical remedies which have been suggested will give him any efficient relief. At least nothing less than a removal of all the burthens which now press directly or indirectly upon him. I shall conclude, gentlemen, by pressing upon you the necessity of immediately applying by petition to parliament for a prompt and unrestricted inquiry into the cause of your distress, and the adoption of some efficient relief from a state of things, which is destructive to your property, and to the welfare and prosperity

of the country. I beg to return my best thanks for the kind indulgence you have shown me. (*Great applause.*)

The CHAIRMAN having put the resolutions *seriatim*, the four first were unanimously agreed to. On putting the 5th, viz.—“That it is the opinion of the meeting, that the distress which has of late years been so severely felt, not only by the farmers, but by all the other industrious classes of the community, has not been the effect of unavoidable circumstances, nor of an ordinary course of events, but we believe is attributable to the operation of an act of parliament upon the currency of the country, which by prematurely enforcing a return to cash payments at an old standard of value, and thereby diminishing the quantity of the circulating medium, has increased two-fold the previously enormous weight of the public burthens.”

Sir T. B. LETHBRIDGE, Bart. rose amidst very considerable applause, and observed, that although the preceding resolutions in which he had concurred might be considered to have been embodied in more suasive terms, yet they had his approbation, but the one now to be considered contained principles and opinions not calculated to assist the meeting in attaining its object with the legislature. There was a fallacy in the resolution and he could not sanction it. He would endeavour to show in what the error consisted, though it was somewhat difficult to cope in argument with a gentleman of so much talent and research as had been displayed by him in support of the views which he advocated. He would, however, endeavour to show what he thought was the right course to be pursued. At the last meeting, he was taken in some degree by surprise, but he was better prepared now to sustain the opinions which he then entertained on the subject, and quite ready to encounter the chastisement which those who differed from him might think fit to inflict. One learned gentleman had attributed to him, by a letter in *The Taunton Courier*, signed “J. B. Bernard,” and not to him only, but to the vast majority who felt and believed with him, all manner of strange things, and advised the yeomanry of this part of the country not to place any credit on his advice. He was, no doubt, a clever and learned doctor, and had written many books about all manner of things, and like another learned doctor of times gone by, who after writing an elaborate work, entitled “*De omnibus rebus*,” wrote another book, of the same description, by way of supplement, entitled “*De quibusdam aliis*.” The same learned gentleman has, in *The Taunton Courier*, expressed himself among other points very wildly on the subject of the present meeting. By the bye, *The Taunton Courier* has deserved the thanks of all parties, for it has properly published opinions on all sides, which enables the truth to be come at, for it is discussion by which that object can be always best attained. He entertains, it seemed, a great horror of the House of Commons and the monied mongers, as he calls them, who he affirmed preponderated in that assembly. (*Cheers and laughter.*) He deprecated all trust on that house. He was even in agony and quite rampant at the thought of petitioning the legislature. “Approach it not,” he says, “they are all a set of very sad fellows, and you must have no confidence whatever in them.” (*Laughter and cheers.*) Nevertheless, gentlemen, those thus so unceremoniously spoken of are the very gentlemen whom you and the electors of a reformed parliament, have thought fit to entrust with the representation of your rights and interests, and the liberties of your country, and to confide in them because they have been elected by the people. (*Applause.*) The learned gentleman has no right to find fault with me for putting forth my opinions in the plain and unvarnished way I have done. The question is whether we shall address the legislature in those terms which are not only likely, but are sure of commanding attention, or whether we shall compromise our claims to the respect of Parliament, by prescribing a chimerical source of relief. (*Hear, hear.*) My excellent neighbour, Mr. Crosse, whose talents and honourable feelings must always command respect, and whose very clever address they had just heard, had, notwithstanding his great ability, overlooked the fact of his bringing forward resolutions, the main feature of

which he did not approve, and therefore all his speech, forcible as it was, must be blotted from your memories. Another worthy neighbour, whom he should feel as proud to call his friend as any individual whom he knew, Mr. Hancock, of Halse, had told them, perhaps very correctly, about the expense of cultivating the land for wheat, and no one was a better judge of farming expenses in general, but with great discretion, had not said one word about the currency; and why? because he had the good sense to avoid saying anything about a subject which he did not understand. Another gentleman, who followed Mr. Hancock, had entered largely into the question of the currency, or the monetary system, as it was called. But this is a very nice subject—and it was to the fallacies contained in the speech of this gentleman, that he (Sir Thomas) wished more particularly to reply to, because they were specious—they were captivating; and from the talent with which they were urged, were likely to mislead this meeting, and to induce them to carry to the foot of the Legislature opinions neither founded in fact nor likely to be received with any favour, and might prevent our receiving any relief, for, if we voted impossibilities, we must expect disappointment. He (Sir Thomas) recollected well when wheat was fifteen shillings and a guinea the bushel, and those were thought fine times; the farmers were all gentlemen; they took their turtle soup,—(*cheers and laughter.*) and not unfrequently their Madeira; he did not blame them for it, they had a right to indulge themselves. They thought they could afford it; and I would ride in a coach and six if my means were adequate to the expense; but before I do so, I must look to my pocket, and see if I can honestly afford myself this luxury. Mr. Pitt was the great financier of that day, but he left us a bill to pay, and we are now contending who shall pay this old bill. (*Cheers and laughter.*) It must be paid, gentlemen, by somebody; that, no one,—no English heart, will deny. The Bank restriction which enabled Mr. Pitt to raise the wind to carry on his gigantic wars, was no doubt a great cause of the mischief which, ever since, has so severely operated on the agricultural classes, but by no means the only cause; and we now propose going to parliament to ask them to revise the act of 1819, Sir R. Peel's Bill, which was to remedy the effect of 1797, and which has been the means of driving away from this country thousands who have expatriated themselves, and ruining very many families, and when this evil of 1819 has nearly, if not entirely reached its utmost possible extent, and done its worst. Thus a measure which took place so far back as 1819, is now put forward as the only cause at this day of all our suffering. I am (said Sir Thomas) quite astonished at this. You have a debt to cope with, and a duty to perform in paying it which you cannot get rid of, but in the way which belongs to every honest Englishman. (*Cheers.*) The worst part of the mischief is past; like a man in his grave, its course is run; it is powerless of further evil; but that which it has cast upon us must be borne. You have many of you drank the last dregs of the cup: and would you now, at the moment when you have reached the acme of your misfortune, call on the Legislature to return to a trumpety paper currency, which, while it lasted cheated every poor man who could not judge for himself? He remembered well an old servant of his father, who had saved sixty pounds by long and faithful service. This he had deposited for safety, as he thought, in one of those paper establishments, with which the depreciated currency had overstocked the country. All was lost; and many thousands, like him, had in the same way been robbed of their all. An interesting story had been told by Mr. Falkner, who had said that one heifer had sold that day in Taunton market for 6l. 6s. which, twenty years ago, would have fetched 13l. He (Sir Thomas) would himself very much like to get 13l. each for his heifers, but not in a depreciated currency, which would not mend his gains, for, according to the worthy gentleman's own shewing, the currency was now enhanced one half, consequently 6l. 6s. now in real gold, was nearly as much as 13l. in a paper currency, which was the grand remedy which he called upon parliament to apply to our difficulties, and which,

over and over again, he and all who argued with him tried to shew, was all that was wanted to remove them. He remembered, when in parliament, doing a thing which he was ashamed of, all his life afterwards. (*Cheers and laughter.*) He had agreed with a great majority of the House of Commons in voting that a 1*l.* note and one shilling were of the same value, the same thing as a guinea! Mr. Vansittart, the Chancellor of the Exchequer, told them it was, and they were blind enough to believe him, because generally speaking, it was so believed, and no question had then arisen as to the quantum. What (said Sir Thomas) could make me such a blockhead (*great laughter and cheering*) I cannot now imagine. Mr. Vansittart was a man of considerable talent; but if he were again Chancellor of the Exchequer, and I were a member of the House of Commons, I would rather see him hanged than follow him. (*Laughter and cheers.*) If I have a sovereign in my pocket now in 1835, I know its value here and everywhere else, the gold standard being the same nearly all the world over; but if I have a bit of paper in my pocket, I know not how to estimate its worth. And here, in a powerful appeal, the Hon. Bart. called on the meeting to take care what it did. The character of Englishmen stood high, all over the world, and we could not be too wary how we acted on the subject of the currency, lest we should impair that enviable estimation in which we were held for national virtue and moral integrity in every civilized country. Some say the evil which prevails lies with the monied interest, others with the commercial and manufacturing; but I advise you, as an old stager—(*cheers*)—not to be misled by fine speeches and dazzling tropes and metaphors, but to be governed by the dictates of an honest spirit, and of sound good sense. One would suppose by the the arguments of some persons that they thought wheat alone was to pay the whole of the interest of the national debt, and furnish the revenues of the state. Does wheat, at 37*s.* a quarter, do this? One of the main averments in the resolutions is grounded upon this fallacy. It seems as if put forward to dazzle and mislead. It says, because 100 years ago wheat sold at 38*s.* the qr., and about 20 years ago it sold for 83*s.* and now that it sells for 32*s.* per qr., therefore the currency has done all this. And further it leaves you to infer that you must therefore be totally unable to pay the interest of the national debt, which, one hundred years ago, it says, was 100 millions only; then, twenty years again, it was 600 millions; and now that it is 800 millions, I will ask, Gentlemen is the interest of the national debt paid by the sale of wheat? Are there no other means to raise it? The argument must mean this, or it means nothing. Surely, gentlemen, never was there so poor an attempt at deception—it looks dazzling in the eye—it lies in a nutshell. You know it does. Did you not ever hear of such things as the *customs*, and the *excise*, and the general taxes? And does not the monied man as well as the farmer, eat, drink, and lie down on a taxed bed? Indeed, they feel the taxes so much sometimes, that they cannot sleep for thinking of them. (*Cheers and laughter.*) Our revenue arises from these customs and excise, and general taxes, and therefore is it fair to put the taxation of the farmer so prominently forward as being the only distressed party in the country? Nevertheless, I do not say that you are not to go to the legislature and ask for such relief as it can afford. Parliament is composed of men of honour and property, and they will consider and deliberate to do what is right, and we are bound to use their credit for that inclination, for, as I have said before, they are elected by the people. (*Cheers.*) The alteration of the currency by repealing Peel's bill now, would give you no more relief than to any dealer in coffee, snuff, and tobacco. The hon. bart. said some of the means of relief rested with themselves, such as a more careful mode of expenditure, a lowering of rents to a fair degree—a different course of cropping. If wheat won't pay, try flax; he had known one hundred acres this last year grown, and the farmers had been well paid. [Here a farmer asked the hon. bart. where they were to get dung? and he received for answer, that if he would hire him (Sir Thomas) as his bailiff,

he would tell him where. This created a good laugh.] The hon. bart. then concluded by calling on the meeting to leave out all the resolutions after the fifth, and said, "if you do this, you will do a wise thing, and will not only ensure respectful attention with parliament, but will attract attention in other parts of England, to what has been done in West Somerset, and thus by simultaneous proceedings produce a more powerful effect; but if you persist in the delusion, of following the currency, as the only cause of your distress, and will not take my advice, I will not march through Coventry with you. (*Cheers and laughter.*) You must take your own course, and when you get to the foot of the legislature, your petitions will only create their mirth and not their sympathy. Gentlemen, I have, I trust, replied with some argument as well as declamation to those who have preceded me, and I conclude by saying, "petition Parliament by all means, for what they can do, but avoid to ask for follies which they cannot grant."

This address of the hon. bart. was received with great attention, and effected a complete alteration in the opinions of many, and was much cheered.

E. B. PORTMAN, Esq. was received with warm demonstrations of respect on seconding the amendment. The hon. gentleman observed, that it was the duty of every one who had especially directed his attention to the subject, to come forward at this juncture, and contribute to the common stock of information according to the best of his experience and ability. This was by no means a new subject with him. He had fought in parliament side by side with the hon. bart. who had just so ably addressed them, and though hopeless of success in contending for the interests of agriculture, had persisted night after night until they were at length left in a snug minority of nine. Mr. Portman adverted to the low price of produce, and to the question of the currency as applicable to the relief of the suffering farmers, and contended that the return to a paper currency ought to be deprecated by every honest man, and by no one more than the agriculturist himself. Mr. Portman argued that the fostering of the question in Parliament would necessarily lead to disastrous results. A demand for gold would instantly ensue—the landlords must look to their tenants for the supply; those who could obtain it must meet its enhanced value, and such as were in arrear must inevitably sink in their landlord's solicitude for his own preservation. Almost every interest except that of agriculture, has now recovered from the blow inflicted by the sudden return to cash payments, and it appeared, therefore to him, unwise to urge upon the attention of Parliament the consideration of a question, from which, not only no good could arise, but which if thus untimely pressed might invalidate the claims to respect, and defeat such means of relief as the legislature had it in their power to bestow. The hon. gentleman then went into some details as to the operation of the currency to show that the gold standard was the true criterion by which to adjust the value of every description of marketable goods, whether merchandize or farming stock, and having now come back to that standard, we might expect our markets for farming produce to be as steady as they were for the hundred years between 1697 and 1797, during which the average of wheat was from 5*s.* to 5*s.* 6*d.* the bushel. All are agreed in one point—the universal depression of produce, and that it is impossible for farmers to go on at present prices. Parliament cannot interfere between landlord and tenant. They must adjust their debtor and creditor accounts in that spirit of fairness and kindly feeling towards each other, which it is their mutual interest and bounden duty to adopt. Their interests are identified. The one cannot prosper while the other is in adversity, but can the man who industriously tills his farm with his best efforts, support himself and those associated with him in his rural labours? At the present prices, were the land his own, in very many instances he certainly could not. But if parliament can effect no good in providing a better market for your produce, it might relieve them in another way; the abundant harvests for the last few years, for which he sincerely thanked heaven, had, in

co-operation with large quantities of produce from Ireland, thrown down the markets; the Irish grower sent over his produce under advantages which we had a right to call upon the legislature to investigate and adjust, so as to place both the Irish and English grower on equal terms. In Ireland they were exempt from several burthens which weigh heavily on the British cultivator. The Irish are not compelled to support their poor; and though bound to pay their tithes, yet, unlike the English farmer, who honestly meets that claim, the Irish cultivator avoids it by every stratagem in his power. If the population of England require fifteen or seventeen millions of quarters of wheat to meet its annual consumption, how can it be wondered at, when Ireland by increasing annual supplies at last pours into our market her three millions of quarters in addition to the produce of harvests, each for four years being equal to our average consumption! (*Hear, hear.*) Then (said Mr. Portman) let us go to parliament and honestly tell them our grievances, which he was sure would command the liveliest sympathy and attention; and let us ask firmly and respectfully for a full and unrestricted inquiry into the cause of our complaints; let us urge them in terms which will come upon them with the efficacy of an order to set about an immediate examination into our case, and forthwith to apply a remedy; let us point out the peculiar disadvantage which oppress us, not with a view to throw impediments in the way of the prosperity of other interests—(*applause*)—but to show the unfairness of being obliged to contend with the same class of interests which, from local position, are exempted from burthens peculiarly weighing upon us. The hon. gentleman then adverted to the necessity of introducing poor laws into Ireland, and contrasted the better arrangements in respect of the poor in the north of England with those in the South; in the North, a pauper, and consequently a poor rate, were hardly known; we had mismanaged and demoralised our poor, and had no right to seek in general taxation for that relief which the examples elsewhere showed we might, by a better system, accomplish for ourselves. Our manufacturers at Manchester now wanted hands, and he had seen an advertisement for one hundred; he hoped, therefore, that our poor would find employment without emigrating. The hon. gentleman concluded an admirable address which repeatedly elicited applause, by giving his opinion that high prices must not be looked for, and recommended every tenant honestly to state his condition to the landlord, and by mutual concessions to adjust their interests with feelings of beneficency, and sympathy for each other on terms of well considered justice.

E. A. SANFORD, Esq. M.P. on rising, was greeted with very great applause. The honourable gentleman observed, that he considered they were much indebted to those gentlemen who had been the original promoters of the meeting, for having afforded the inhabitants of that neighbourhood an opportunity of calmly and openly discussing a question, which now appeared to engross a large portion of public attention. The views of those gentlemen had been laid before the meeting with great clearness and intelligence, but they had been most ably answered by the eloquent and lucid statements of his honourable friends, Sir T. Lethbridge and Mr. Portman, and he indulged a hope that the proceedings of that day would tend to remove any impression which might exist in that neighbourhood, that we were to expect relief, by a depreciation of our currency, from the distress now so grievously oppressing us, as Agriculturists. Opposed as he had been to the manner in which the change from a paper to a metallic circulation had been effected in 1819, and sensible of the misery which had been produced by the alteration, still, having now, it may be hoped, passed through the most severe portion of the trial, he could not consent again to place the country in so fearful a position, as might arise from a recurrence to depreciation; but would rather hope that parliament would use our past experience as a warning never again to allow the government to tamper with the currency. The nation, however, had a full right to demand of parliament an unrestricted and searching enquiry into the effects that

change had produced, and for such an inquiry he had always voted. The reason alleged for refusing it had ever been, that parliament ought not to allow the inquiry, unless it was prepared again to make an alteration, as unreasonable expectations might thereby be excited and very serious mischief created. The force of this argument he did not allow, and he was still prepared to support a full and entire inquiry. He had stated on the previous day that he feared it was not in the power of the legislature, to ensure them a better price for their wheat, and this opinion was founded on the fact, that the amount of duty now to be paid on the importation of foreign corn is greater than the price of the grain when sold in our markets; it must act therefore as a prohibition, and proves that the present low price could only proceed from a superabundant supply of our own growth, and although parliament was bound to protect them from undue foreign competition—with the competition of home-grown corn, it could not interfere. Still he considered however difficult, if not impossible it might be for parliament, by any enactment, to give them a more remunerating price for their wheat, yet it was bound to endeavour to lighten those burdens which peculiarly affect the agricultural interest, and he sincerely hoped another session would not be allowed to pass by without a commutation of tithes having been effected. He thought also that the Irish landlord, and the Irish farmer ought to be placed on an equality with their fellow countrymen in England, who ought not to be subject to burdens from which they were exempt: he therefore felt a hope that ere long a provision for the poor would be legalized in Ireland, and such a measure should have his constant support. (*Cheers.*) It was true that the labouring people of that fine country could be living in the most abject distress, surrounded by abundance which they had assisted in creating, but in which, from extreme poverty, they were unable to share, being compelled to export the produce of their labour to the already overstocked markets of England; for this grievance the agricultural population of this country had a right to ask of parliament a remedy. It was a source of great satisfaction to him to find that his opinions were entirely in unison with those of so large a portion of his constituents as had that day been assembled. Should it be their pleasure to address the legislature in accordance with the resolutions which had then been adopted, their petition should have his warmest support, and he knew he might also state for his hon. friend and colleague who was unhappily prevented from attending the meeting, that he also would most heartily support it. The hon. gent. then begged to take that opportunity, it being the first time since his return from abroad that he had met so large a number of his constituents, of expressing how deeply he felt the kindness which had been shewn him by re-electing him in his absence. It was not in the power of language to acknowledge in terms sufficiently expressive of his feelings how highly he valued the confidence they had reposed in him, and how greatly he felt the debt of gratitude increased by the generous and spontaneous manifestations made in his favour when he was in a distant country. Such kindness deserved, and would throughout his life excite in him the strongest desire to shew that he was not unworthy of it; and in whatever manner he could promote the interests of the electors of West Somerset, whether in or out of parliament, there was no personal sacrifice from which he should shrink in testifying the sincerity of his esteem for them, and gratitude for their conduct. (*Cheers and continued applause.*)

Sir T. LETHBRIDGE'S amendment having been put and carried unanimously, the meeting, after voting thanks to the chairman for the exemplary manner in which he had sustained his duties, separated at half-past four o'clock.

*Resolved,*

1st.—That as agriculture is a grand source of the wealth of nations, no country can be in a prosperous state whose agriculture continues for any length of time to bring loss and ruin upon those who are engaged in it.

2nd.—That this meeting therefore views with the utmost alarm and apprehension, the long continued dis-

press and increasing difficulties under which the agricultural interest of this country labours.

3rd.—That this continued depression which has already brought total ruin upon many thousand farmers, and has reduced almost to a state of insolvency a large portion of those who yet retain their stations, will, if remedial measures be not promptly adopted, effect such a further destruction of agricultural capital, as cannot fail to be productive of the most ruinous consequences to the landed interest.

4th.—That it becomes the imperative duty of all persons who are interested in the prosperity and welfare of the country, and particularly of those who are more immediately connected with the landed interest, to promote a prompt, diligent, and *unrestricted* enquiry into the cause of such extensive and increasing distress, and to urge, by every constitutional means, the redress of a grievance, which is gradually undermining the strength and resources of the nation; and is calculated to lead to the most serious crisis that this country has ever experienced.

5th.—That though successive governments have endeavoured, by a reduction of taxes, to diminish the excessive burthen unnecessarily thrown upon the people, the existing taxes demand for their payment more corn and other produce of the land than was required during the most expensive period of the late war; and this meeting believes that no reduction of taxes which can be effected under present circumstances, will afford any substantial relief; and that the only means of restoring the present, and securing the future prosperity of the country, will be found in the equitable distribution of those vastly increased local burthens which now press almost exclusively upon the land.

6th.—That these resolutions be printed and published, and that they be inserted in the principal journals of the West of England—that a subscription be entered into for the purpose of defraying the necessary expenses, and that the chairman be requested to carry these resolutions into execution.

7th.—That a petition, embodying the substance of these resolutions, be prepared; and that E. A. Sanford, Esq., be requested to present the same to the Commons House of Parliament.

The remainder of the firms being enumerated as having consumed less than 150 qrs. of Malt, we have not particularized them,

## RELIEF OF AGRICULTURAL DISTRESS.

It is very gratifying to find that there is an increasing disposition among landowners and occupiers to exclude the currency question from any inquiry which may be entered into on the subject of agricultural distress. Meetings are daily taking place, which we regret our limits will not permit us to notice: there is one, however, to which we invite especial attention, as being one of the most important, if not the most important, which has hitherto been held, and which will be found reported at great length in another part of our magazine; we allude to the meeting of landholders and farmers at Taunton, in Somersetshire, on Saturday the 28th ultimo. This meeting presented a body of between six and seven hundred persons, the majority consisting of landowners and land occupiers. Landlords and tenants were there met together for the purpose of considering the best means which could be adopted for obtaining relief from that distress under which most persons admit the tenant farmer especially to be suffering at this time. The currency was, as usual, introduced, and would have proved a stumbling block, had not the good sense of the meeting avoided it. According to the report, Mr. Falkner was the only person who went at length into the subject, with a view to show that the present low prices were attributable to our money system, and that nothing short of a depreciation of the currency could possibly restore high prices, which he considers absolutely necessary to uphold the agriculture of this country. His speech was by no means calculated to bring conviction home to the mind of any man who was previously unacquainted with, or unprejudiced upon the subject. So far from it, in our opinion he betrays throughout a want of confidence in himself, and particularly in the following observations;—he says, “I feel very confident that the state of the currency is the seat of the present disorder of the farmer's affairs, and that none of the topical remedies which have been suggested will give him any efficient relief. *At least nothing less than the removal of all the burthens which now press directly or indirectly upon him.*” Here then is a direct admission that a removal of those taxes which press upon the farmer will afford him relief. The advocates of a depreciation one and all agree that its tendency would be to occasion a rise in prices. A rise in prices must be beneficial to landlords as well as tenants, inasmuch as it would enable them to obtain higher rents. The landlord, therefore, who opposes any measure tending to produce a rise in prices must be blind to his own interest, by resisting a plan calculated to increase his rent-roll. So long as the number of landlords who advocated relief to the tenant farmer by a reduction of rent and taxation to meet the reduced price of agricultural produce was small, it was easy to set them down as an isolated body of men, posses-

sing crotchety notions at variance with the positive experience of practical men; but now that we find the most opulent and intelligent landowners at almost every meeting, deprecating any steps to occasion an artificial rise in prices, when we find the depreciation of the currency advocated from the year 1819 up to nearly the present moment by several journals conducted with great talent and ability, at length abandoned, even by the *Herald* itself, it is not too much to conclude that it would be prejudicial to the general interests of the country, and therefore injurious to the agriculturists themselves, to make such an attempt. At the Taunton meeting Sir T. Lethbridge, Mr. Portman, and Mr. Sandford, all considerable landowners, deprecated any tampering with the currency, although it might possibly lead to a temporary improvement of their rent-roll. Sir T. Lethbridge ably and eloquently pointed out the injustice which must result from a return to a depreciated currency. But, says the tenant farmer it is utterly impossible to pay the present rent with wheat at 4s. 6d. per bushel. We do not doubt that such is the case in most instances, and the remedy, say we, is an instant reduction of rent. By the tenant, a farm must be regarded in the same light as a wharf, a yard, a mill, or warehouse applicable to a specific purpose. He must calculate all his outgoings as near as may be; he must estimate the probable amount of his crops at existing prices; and he should pay to his landlord only so much for rent as may remain after paying his outgoings, retaining a proper per centage for capital invested, and supporting himself and his family. If nothing remains, so much the worse for the landlord; it will not be a novel occurrence. Numerous instances could be adduced in which the amount of the poor-rate was so large as to leave no rent, and the farm has been let rent-free. In these cases, had wheat been at 8s. per bushel, instead of 6s., the land would have afforded a rent; so, if the poor-rate had been 2s. per acre instead of 20s. Rents must be reduced to the level of prices, and Parliament must remove all the burthens to which the land is particularly liable. The peculiar situation of the tenant, which precludes him from moving his stock, &c., from one farm to another, as furniture or stock in trade may be removed from one house to another, leaves him in a great measure in the power of his landlord, who, in scarcely any instance, reduces his rent so as to correspond with the proportionate decline in the value of produce. Thousands and tens of thousands of farmers have been reduced to beggary, and compelled to leave their farms, their last shilling having been taken for rent, who, if they had held by a corn instead of a money rent, would have at this time been supporting their families in comfort and respectability. Landlords should follow the example of Mr. Gould, which is thus noticed in the *Taunton Courier*:—

A very equitable and benevolent principle prevails

in the arrangements of farms belonging to J. Gould, Esq., Chairman at the great Agricultural Meeting at Taunton. On letting an estate, he goes over it with the proposed tenant, acre by acre, and both agree upon what ought to be the produce. The rent is then fixed according to the immediate market price; but if a decline takes place, the rent is lowered accordingly in the same proportion. This seems an amiable conformity with the precept, "Live and let live."

## BONDED CORN.

TO THE EDITOR OF THE MARK LANE EXPRESS.

Plymouth, Dec, 3 1835.

In the extract from the Times which appeared in your last paper, the objections advanced against the proposed measure for manufacturing foreign wheat into flour and biscuit for exportation are of so feeble a character, that if no better can be found they will almost amount to an argument in favour of it. They are stated to be reasons urged against it by "the trade." Now it is well known that with the exception of a few owners of bonded warehouses who profit by a system ruinous to their neighbours, "the trade" in general are strongly in favour of the measure from a conviction of the benefit to be derived from it.

It is stated as the main ground of objection to it, that gross frauds would be practicable under it. As the writer has not stated the nature of the frauds which he anticipates, or in what way he supposes they could be effected, it is impossible to meet him in detail, but whoever reads attentively the plan proposed for carrying the measure into practice, which appeared in the *Mark Lane Express* of Oct. 19 must see, that fraud to any considerable extent would be impossible. In fact the bulk of the article in proportion to its value would of itself be a safe guard against it, and there would be no possible advantage from attempting it commensurate with the risk. Besides the bare possibility of fraud is no argument against the enactment of a just and necessary law. The laws of the customs and excise, are very liable to evasion, which is proved by almost every day's experience, but the legislature does not therefore cease to enact them. Let the penalties as regards corn be severe and rigidly enforced and there will be no frauds of any importance.

A similar measure to that now suggested is in operation in regard to sugar under bond which is allowed to be refined under certain regulations for exportation, foreign metallic ores are also allowed to be taken out of bond for the purpose of being smelted, and there is no reason why the same system should not be adopted with regard to foreign corn without prejudice to the revenue or the agriculturist.

Another suggestion against the measure in the article referred to is, that it would be impossible for persons in this country to compete with foreigners in the supply of our colonies, since the charges in transporting the wheat hither would make the cost to the English manufacturer 15 per cent. beyond what the foreigner would have to pay. Now supposing this difference to exist, it would be more than compensated in the saving of time and expense to the British ship-owner, in having his vessel laden at home instead of going to Hamburg and ports in the Baltic for her cargo. Besides it may be expected that the superiority of British skill and capital will neutralize this advantage possessed by the foreigner, and let it be recollected that the Baltic and even Hamburg are generally inaccessible during a great

part of the winter, while the trade might still be going on from this country to the West Indies and South America. But the best answer to this objection is the fact before our eyes, that a great trade in this line has been for years carried on in the Islands of Guernsey and Jersey. These Islands being exempt from the operation of our corn laws this branch of trade is becoming of great importance to them, and from being found so profitable is rapidly increasing, steam-mills of great power are erecting with a view to its extension, and it is an instance of peculiar hardship and injustice as regards the people of this country, that they should be denied a privilege enjoyed by a small section of their fellow subjects who are far less burthened with imposts than themselves.

Let the people of this country have the same opportunity of trying it, and if it should not succeed, they will derive the satisfaction of having brought the matter to the test of experiment.

But the objector in warning us against the effects of competition, seems to overlook one most important feature in the case, namely, the advantage we should often possess over the Americans in the manufacture of flour, who it is well known export upwards of a million of barrels annually, chiefly to our West India Islands, and South America. At the present time the price of wheat in America is quoted at 44s to 48s per quarter, while wheat under bond, equally good, may be bought in this country at about 26s to 28s per qr. and of course could be rendered in the shape of flour at least 35 per cent. below the American price.

Yet with these facts before us, we are persisting in the gross absurdity, of tying up our own hands, with manifest injury to all classes of the community, merely from deference to the chimerical fears of the agriculturists, who in truth, are themselves severe sufferers by it, inasmuch as it keeps dormant, and wasting away in bonded corn, an immense capital, a great part of which would otherwise be at this moment invested in English corn, and tend to counteract the present depression.

W. C.

AGRICULTURAL DISTRESS.—At the great annual court of the Duke of Bedford, for his manor of Hardwicke, on Monday, after dinner the subject of the prevailing agricultural distress was, of course, a prominent feature in the conversation. The usual complaints were made against the government and Parliament for not affording relief; when Mr. Carpenter, of Mount Tavy, himself a large landed proprietor, on his health being drank, asked how they could apply to Parliament for relief when there were no taxes to complain of which bore exclusively on agriculture, and pronounced the only true remedy to be a reduction of rent. "Rents must come down," said Mr. Carpenter, and the sentiment was applauded by all present.—*Falmouth Packet*.

FOUNTAIN TREE.—There are few rivulets, and only three springs, in the island of Ferro, one of the Canaries; and these are on a part of the beach which is nearly inaccessible. To supply the place of fountains, however, nature bestowed upon this island a species of tree, supposed to be nearly allied to the *laurus indica*, possessing properties unknown to trees in all other parts of the world. These fountain trees were of moderate size, and their leaves were straight, long, and evergreen. Around the summit a small cloud perpetually rested, which so drenched the leaves with moisture, that they constantly distilled upon the ground a stream of fine clear water. To these trees, as to perennial springs, the inhabitants of Ferro resorted, and were thus supplied with a sufficient abundance of water for themselves and for their cattle.

## GLOUCESTERSHIRE AGRICULTURAL ASSOCIATION.

The Annual Show of the Gloucestershire Agricultural Association took place on Thursday, Nov. 26th, at the New Market, which was fitted up in the most commodious manner for the occasion. We believe we may safely aver that no exhibition of the kind ever gave greater satisfaction as to the quality and quantity of the stock produced. It was computed that nearly nine hundred persons attended, and amongst the company we observed many of the first rate breeders and feeders from the adjoining counties, as well as from distant parts. The Judges who kindly acted upon the occasion were Mr. John Turner, of Noke, near Leominster, and Mr. James Walker, of the Park, near Malvern, who were engaged the whole of the preceding day in awarding the premiums, and we have great pleasure in stating that their decisions gave greater satisfaction than is usual in such matters.

### DAIRY STOCK.

To Mr. John Price, of Pool House, Hanley, for the best dairy cow, (Hereford) ..... £8 0  
 To Mr. William Woodward, of Bredon's Norton, the second best ditto (short horn)..... £4 0  
 Miss Strickland, of Apperley Court, Mr. William Jones, of the Sheephouse, Mr. Niblett, of Haresfield, and Mr. Morris, of Maisemore, contended also for this prize.  
 To Mr. William Woodward, of Bredon's Norton, the best pair of heifers under 4 years old (short horn) ..... £5 0  
 Mr. John Price, of Pool House, and Mr. Pike, of Mytton, were also competitors.  
 To Miss Strickland, for the best pair of heifers under 3 years old (short horn) ..... £5 0  
 Mr. John Price and Mr. William Woodward contended also.  
 To Mr. William Jones, of the Sheephouse, for the best pair of heifers, under 2 years old (short horn)..... £5 0  
 Miss Strickland, Mr. J. Price, and Mr. Pike, entered also.  
 To Miss Strickland, the best bull, under 3 years old, (short horn)..... £8 0  
 No competition.  
 To Mr. Joseph Stallard, of Redmarley, the best bull of more than 3 years old (Hereford)..... £10 0  
 Miss Strickland, Mr. John Price, and Mr. Edward Barnes, also entered.  
 This premium was the gift of Messrs. Wells, Ferris, and Witts, the Judges of last year.

### Mr. Baker's premium.

To Mr. John Price, the best bull, cow, and offspring, (Herefords) ..... £10 0  
 Mr. William Jones and Mr. Edward Barnes entered also.

### FAT CATTLE.

*Premium—the gift of W. L. Lawrence, Esq.*

To Mr. Polhill, of Eyford, for the best fat ox (short horn)..... £10 0  
 Additional as breeder..... £2 0  
 Mr. John Crump, of Hasfield, Mr. Pike, of Mytton, Mr. John White, of Abloads Court, Sandhurst, Mr. D. S. Hayward, of Frocester, Mr. Edward Barnes, of Tirley, Mr. Thomas Brunson, of Cheltenham, and Mr. Walters, of Barnwood, competitors also.

The Judges particularly commended Mr. Walters's Hereford ox, and the oxen generally in this class.

To Miss Strickland, for the best fat cow, (short horn)..... £8 0  
 As breeder also ..... £2 0

Mr. Brown, of Minety, Mr. Peacy, of Chedglow, Mr. Edward Barnes, of Tirley, Mr. Niblett, of Haresfield, and Mr. William Woodward, of Bredon's Norton, were also competitors.

The Judges expressed their admiration of the whole of the fat cows exhibited for this premium, and desired

that it might be said that their selection was made with difficulty.

*Premium of J. W. Walters, Esq.*

Mr. Charles Nind, of Haresfield, near Winchcomb, for the best fat heifer, (Hereford) £10 0  
 Bred by Mr. William Doe, of Ditchford Hill, Worcestershire.

Mr. William Priday, of Longford, also showed for this premium.

### SHEEP.

To Mr. William Hawkins, of the Hawthorns, for the three best long wool ewes ..... £5 0  
 Mr. John Crump, of Hasfield, and Mr. William Slatter, of Stratton, also entered.  
 To Mr. Joseph Hall, of Coates, for the three best long wool shear hogs..... £5 0  
 Mr. William Hawkins also entered.  
 To Mr. William Slatter, of Stratton, for the three best long wool theaves..... £3 0  
 Mr. William Hawkins, Mr. John Crump, and Mr. Thomas Hall, also entered.  
*Premium, the gift of C. W. Codrington, Esq., M. P.*  
 To Mr. Thomas Hall, for the best long wool ram ..... £5 0  
 Mr. W. Slatter entered also.  
 To Mr. W. Jones for the best short wool ram, ..... £5 0

No Competition.

### PIGS.

To Mr. John Beach, of Redmarley, for the best fat pig ..... £2 0  
 Mr. John White and Mr. D. S. Hayward, also contended.

### HORSES.

To Mr. Thomas Hall, of Througham, the best cart stallion ..... £5 0  
 No competition.  
 To Mr. Brown, of Minety, for a cart mare and foal ..... £5 0  
 No competition.

*Premium, the gift of C. W. Codrington, Esq., M. P.*

To Mr. Webb, of Haresfield, for the best cart mare, rising 3 years old..... £3 3

### CHEESE.

To Mr. William Hawkins, for the best hundred weight ..... £3 0  
 To Mr. Leonard, of Water End, the second best ditto ..... £2 0

### MECHANICS.

To Mr. Anslem Bailey, of Churcham, for a skim plough..... £2 0

### LABOURERS.

To Samuel Newman, recommended by Mr. Joseph Stallard, of Redmarley, the first premium, for having lived with him twenty years, and brought up nine children, without parochial relief ..... £3 0  
 To Samuel Aigne, recommended by Mr. Wm. Woodward, of Bredon's Norton, the second premium, for having brought up seven children, without parochial relief.. £2 0  
 To Hannah Davis, recommended by C. B. Smith, of Whaddon, for having lived for eighteen years as dairy maid in his service ..... £2 0

### THE DINNER, AT THE KING'S HEAD.

At half-past four o'clock nearly one hundred gentlemen sat down, the President of the Association, the Right Honourable Lord Segrave, in the chair; the Secretary, John Kemp, Esq. Vice President. Amongst the company were the Hon. Craven Berkeley, M. P., C. W. Codrington, Esq. M. P., E. Holland, Esq. M. P., W. Goodrich, Esq., W. L. Lawrence, Esq., J. W. Walters, Esq., W. Polhill, Esq., E. Hopkinson, Esq., H. N. Trye, Esq., J. C. Hayward, Esq., D. J. Niblett, Esq., &c. &c. After the cloth was removed upwards of thirty gentlemen joined the party.

A number of appropriate toasts were drank and the evening passed off with the greatest good humour and conviviality.

## HORSEMANSHIP.

## THE RESTIVE OR RESTY HORSE.

No description which ever yet appeared on paper has given a correct idea of the subject under consideration ; and for the best reason in the world, namely, that those who have written upon it were most profoundly ignorant of what must constitute its very essence, *practical knowledge*. There are various degrees of restiveness in horses : the first arises from a trifling degree of obstinacy of disposition, which will manifest itself in the following manner:—If, on returning from a journey, the rider should attempt to reach home by a different road from that to which the horse has been accustomed, and which the horse suspects does not lead to his stable, he will testify symptoms of unwillingness to proceed according to his rider's wishes, even to the extent of rearing; but, if pulled round, will go on without further trouble. Many horses, good tempered and willing in general, will show disobedience to this extent. I rode, for two years, a good little Irish horse, which would occasionally rebel in this way, and which, nevertheless, was, on the whole, a pleasant horse to ride.

There are others which will carry this disposition to a much greater extent, will resort to disobedience oftener, and are consequently more troublesome, and more dangerous.

The next degree of restiveness arises from a lazy, bad disposition. I will exemplify it. Seven or eight years ago, I accidentally purchased a thorough-bred grey mare for a trifling sum. I met with her in a large town in the North of England, and she (like most restive horses) went quietly and even willingly in the street, and so long as she entertained no suspicion that it was intended to take her far from the stable. I resided at the distance of several miles, and sent my servant the following day, to fetch her home. As soon as they reached the outskirts of the town, the mare refused to carry him further; and the man, not being a superior rider, dismounted and led her. This circumstance, however, he did not mention to me. In the stable, this mare was as quiet and as good tempered as possible; it was not till after a lapse of several days that I got upon her back, and had not proceeded one hundred yards before I began to suspect her disposition. She pointed her ears forward, breathed hard, and was prepared to stare and affect to be frightened at any object which came in her way. However, I did not let her perceive that I noticed these indications of vice, or we should have come to battle sooner, as an animal of this description very soon discovers if the rider be timid or awkward. We had proceeded about four miles, when she thought proper to shy at a post, started and turned suddenly back. I twisted her round several times, gave her the steel once only, and she went on.

About a mile further, she refused to pass a stable-yard; I resorted to the same expedient and with the same success. I was enabled to ride her afterwards with little trouble; but, as she possessed neither sufficient speed nor power for my purpose, I sold her. This animal's restiveness proceeded entirely from a cunning and lazy dispo-

sition; but she was not the less dangerous on that account.

A friend of mine, a few years since, after bargaining for a fine chestnut mare, reserved the condition, that I should ride her a few miles. She went unwillingly, and when about two miles from home, refused to proceed further. I sat quietly on her back; and, in the course of a few seconds, she began to move stern foremost, and continued this retrograde motion for about twenty yards, when I twisted her round several times, placed her head in the direction I wished to pursue, and gave her the steel very freely. About two miles further brought me to an inn by the road-side, when she made a rush to the stable-yard, and endeavoured to crush my leg against the wall: this I frustrated by bending her head to the wall, where, however, she endeavoured to remain: she hung like a dead weight, and appeared as sulky and as savage as possible. I adopted those modes and manoeuvres which the reader will find described under the head, Management of the Restive and the Vicious Horse, and reached the end of my journey. As I expected, this mare came home without manifesting restiveness, or vice of any kind. She was a very dangerous brute, and a bad goer into the bargain. I have often heard it very thoughtlessly and very ignorantly asserted, that restive and vicious horses, when once reduced to obedience, generally evince superior powers of speed and strength; or, in other words, are superior animals; which is quite a mistaken notion, as the qualities just mentioned must depend on animal organization: there must be the requisite form to produce these effects.

Many restive horses will go well enough in company. Some years ago, a dealer offered me a very fine-looking horse at what I thought a very moderate figure, or price, and I was disposed to purchase him; but made a previous trial, the *sine qua non*. The animal appeared well calculated for hunting, and he was represented as perfect in the business. On going to meet the hounds with him, the dealer's brother accompanied me, on another horse; and although the animal on which I was mounted manifested no unruly disposition as we proceeded to the fixture, there was something in his manner which excited my suspicion, which, indeed, is the case with most, if not all, restive horses. A hare was soon found; and the horse went well, and took several fences in good style. At length the dealer's brother and myself became separated, when, as I expected, the horse in question displayed—not the cloven foot—but a most villainous disposition. The next jump he refused; and although I ultimately forced him over or rather through, I was brushed out of the saddle by a young and pliant oak. However, I never quitted the bridle; and, having re-mounted, was anxious to proceed. I reached the next fence within about thirty yards, when the animal refused to go at it: a battle was the result; and though, after much trouble and punishment, I forced him up to it, I could not induce him to rise: he blundered through it. There the matter ended: I returned the horse. But it frequently happens that a restive horse will go well with hounds. A friend of mine had a restive brute, one that kicked, on

mounting, tremendously, and was altogether of a savage disposition; yet, when the fit of kicking was over, no horse could go better with hounds.

The last restive brute which I possessed, was a Friend Ned mare, well and powerfully formed, and an excellent hunter. She was the most cunning and the laziest animal upon which I ever sat; and her vicious habits arose from those dispositions. When I purchased this mare, she was very low in condition; and although I gave her a gallop, prior to riding her home, she made no signal which excited my suspicion. I allowed her to go very gently home; and was not surprised at her sluggishness, which I concluded arose, in a great degree, from want of condition. It so happened that business took me from home, and I did not ride her again for several weeks. In the interim she had been well fed; and, as I afterwards learned, had thrown my servant several times in her exercise. I mounted her again early one morning, not entertaining the slightest idea of the pranks she was about to play; but I had not ridden many hundred yards before I met the mail coach, when she instantly turned short round and galloped in the direction for her stable. The trick was performed so suddenly, and I was so unprepared for it, that she had galloped twenty yards before I was prepared to oppose her. On placing her head in the right direction again, she affected to be much alarmed at the coach: she ran sideways, kicked and plunged, and exhibited all those vicious and dangerous antics for which horses of this temperament are remarkable. I now became fully aware of the disposition of the animal with which I had to deal. After passing the coach, she affected to run away; and, as the road was clear, I let her go, sitting firmly upon her, and having her well in hand. She soon slackened her pace, and dropped into a trot; and she would soon have dropped into a walk, had I not given her to understand that in this I should not indulge her. I trotted her on smartly: she placed her ears pointing forward, an evident manifestation of ill-will; and every now and then made a sudden start, or rather *side-jerk*, as if she took fright at a stone, a heap of dirt, a stump, or any thing which happened to present itself. It will be as well here to remark, that this lazy brute knew the mail coach as well as her rider; and that either at it or the other objects just mentioned, she was no more alarmed than myself. It was all affected, under the impression that she would thus, by alarming or throwing her rider, be enabled to return home; and had she been suffered to return, she would not have made the least hesitation, had she met fifty coaches. Indeed, had I suffered her to proceed at her own pace (about three miles an hour), I might have accomplished my journey with the bridle loose on her neck, as she would have gone as quietly and as safely as possible. However, I wished to proceed at the rate of eight or nine miles an hour, which she was very unwilling to perform; and, as she kept playing her tricks, on coming to a bye-lane, I turned into it for the purpose of fighting the battle fairly. The lane was little frequented, was sandy, and destitute of walls or other objects which could place me in

danger. I took her fast by the head, put her into a gallop, and compelled her to increase her pace by the very free administration of the steel. For some time she made her *side-jerks* most viciously; and on all these occasions she received the spurs in return, as severely as I could give them. We thus proceeded about a mile, the mare gradually giving up or submitting, till at length when I pulled up she was completely beaten. The punishment she had received was severe, and she went as quietly and as submissively as possible for the remainder of the journey. I am no advocate for coercive measures except where they become indispensable: this was one of those cases.

By way of illustration, I will here observe, that, some years prior to this period, I had a fine bay horse (by Champion) remarkably powerful and uncommonly high-spirited and playful. He, being in high condition, would dance and caper, and play pranks enough to alarm a timid horseman, particularly by the cover side, when drawing for a fox; but it was mere frolic and play; he had not a particle of vice in his composition; he was an excellent tempered animal. It would have been cruel to have punished him for a display of his frolicsome disposition, as the moment the fox went away, all was right.

The mare above-mentioned I rode for one season with the hounds: she jumped remarkably well, could go a good rattling pace, and was the best *creeper* I ever saw, a circumstance arising entirely from her extraordinary cunning and lazy disposition. But she was an unpleasant animal to ride: she was continually manifesting an obstinate unruly temper: if you wished to take your own line of country, she would rebel against such a proceeding; and, in fact, before she could be ridden with confidence or pleasure after hounds, it became necessary to administer a similar punishment to that already described.

This mare was a very greedy feeder; no creature could be quieter or better tempered in the stable: her object was to eat as much as possible and avoid labour. A child might ride her, if the bridle were laid loose on her neck, and she allowed to proceed at her own space. Such was her antipathy to move along at any thing like speed, that when pressed forward, she would throw her fore legs about in such a manner as to *speedy-cut* and come down.

#### THE VICIOUS HORSE.

Of course what has been stated in the few preceding pages might have been placed correctly enough under the present head, since restiveness is a vice of the worst description; but as there are vicious horses of a different temperament, I have chosen to ramify the subject for the purpose of more clear elucidation.

The celebrated horse Lottery is vicious, in the sense it is here intended to be understood. He possesses an unruly, savage temper, both in the stable and out of it: he would worry his groom and throw his rider. He will bite, kick, and plunge; and, in consequence, his running was always uncertain. He was one of the finest and the fleetest racers that ever appeared on the turf; and when he happened to be in temper for running, beat every opponent with great ease. As like

produces like, many of his stock have inherited the bad temper of the sire; and on this account I should always decline breeding from a vicious or restive animal on either side.

Lottery indicated a vicious disposition from earliest life; but, having, in his exercise, thrown the lad who rode him, he galloped off, and was not secured without difficulty: this circumstance rendered him more unmanageable: so much so, indeed, that his running could never afterwards be depended on: whence his name, *Lottery*, being originally called *Tinker*.

Orthodox, a very uncertain racer, seemed to unite the qualities of the restive and the vicious horse. On being brought to the post to start, there was a glaring timidity of expression in his eye, which was very remarkable, and which could be compared to nothing which ever fell under my observation. He evidently entertained a most inveterate antipathy to the severity of the race-course, and frequently tried to avoid it by bolting.

Mameluke, like Lottery, was naturally vicious: and his running, therefore, like that of the latter, could seldom be relied on.

Wellington was originally good tempered. I saw him when a yearling, and never saw a better tempered animal: he was very improperly managed, and became vicious: when first brought on the turf, he ran as kindly as possible, but became very uncertain afterwards.

Vicious horses vary in disposition; and some that are dangerous in the stable are pleasant enough on the road, the turf, or the field. Mayfly was very vicious in the stable, but I never saw him run unkindly. Clinton was quiet enough in the stable, but would frequently rear and plunge on the course, and generally started in a savage unruly manner. Clinton possessed more than ordinary cunning. He would carry his groom quietly; but when the jockey came to mount him for the race, he would plunge and rear, and try to unseat his rider, in which I have seen him more than once succeed. He ran several severe races, wherein the whip and spurs were freely administered: whenever, therefore, he observed the silk jacket approach, he seemed to be well aware that the whip and spurs might follow.

What, for the sake of distinction, may be called a *restive* horse, will be uniformly found to possess a superior degree of cunning, and they resort to a variety of unpleasant, provoking, and dangerous tricks, from a thorough laziness of disposition. The *vicious* horse will rear, kick, or plunge, from a fiery or bad temper: such animals are generally vicious in the stable; while the *restive* horse very seldom shews either vice or bad temper except when put to work. The *restive* and the *vicious* horse are distinguishable by a peculiar expression of countenance: the eye of the latter will indicate bad temper, and this sinister expression is very often assisted by a peculiar movement of the ears; in the eye of the former will be discovered a degree of intelligent cunning, which will be vainly sought in a horse of any other temperament or disposition.

Amongst vicious horses must be classed those which are apt to run away; a vice which uniformly arises from inefficient breaking or improper

treatment; and when once a horse has played this prank, he will try to repeat it.

Generally speaking, vicious horses appear to inherit a bad temper from nature. Bad tempered horses may be often rendered obedient and submissive by proper treatment; but when animals of this description fall into the hands of ignorant passionate men, they become vicious. High-spirited horses will become vicious in such hands.

I scarcely ever saw a vicious or restive horse that had not a broad forehead.

Race-horses which manifest an unruly disposition are frequently castrated, which has sometimes the wished-for effect, but fails in many instances.

A vicious horse is never to be trusted; and although such animals are not uncommon on the race-course, their proper place is the off wheel of a stage coach.

#### *Instructions for the Management of Restive and Vicious Horses, as well as for the Rider's Conduct in all dangerous Situations.*

In the first place, let it be well impressed upon the mind, that the horse possesses much greater strength than his rider, and that, consequently, in all our contentions with him, we should meet his power by scientific skill, in which case, we are sure to acquire the ascendancy with little risk or danger; but if force be opposed to force, the horse immediately understands the nature of the contest; he will dispute the matter stoutly, he will place the rider's neck or limbs in jeopardy; and, if he ultimately yield, it will prove but a drawn battle, which the animal will seldom fail to renew on the first favourable occasion. When the efforts of an unruly horse are met by the requisite skill, he does not understand the mode by which he is frustrated; he therefore loses his confidence, and submits.

Of all vices in a horse, rearing is the most to be dreaded. We shall be told by grooms and others that the most effectual method of curing a horse of this dangerous vice is to slip off, pull the animal over backward, and administer punishment while he is on the ground. I have seen this method successfully practised; and I am inclined to think that it will answer the purpose in all cases where it can be effectually accomplished. But it is not easy of accomplishment, unless by a masterly horseman, and a mode which cannot safely be recommended in general. It must also be recollected that a vicious horse, after being completely subdued by one person, will seldom fail to dispute the point with a strange rider. This is the most unfortunate part of the business, and which renders all animals of this description uncertain and dangerous.

In the first place, I would never advise any person to purchase a vicious horse; since, whatever good qualities the animal may possess, they are neutralized in a great degree by his vices, while the use of him is always attended with danger. But when it so happens that a person finds himself in possession of a horse of this description, if he feel desirous of trying the experiment of reducing him to obedience, he will find the following instructions well calculated for the purpose.

When a horse is addicted to rearing, kicking, bolting, plunging, and the like, the modes of horsemanship which I have described in preceding numbers must be brought into action, steadily and forcibly applied, in which the advantage of good hands will be strikingly conspicuous.

The operation of the hands is intended to prevent and deter an unruly or vicious horse as much as possible. The rider's arms must be pressed firmly to the body, the reins separated and taken into both hands, the hands a little up. In this position, the rider should not pull at the horse, unless the latter attempt to force the hands and get his head; on the contrary, the horse should have liberty to move forward, but not to get his head down, since, with his head in that position, he would be enabled to kick most violently; while, with his head held well up, he is prevented from kicking with any degree of violence, and he can only make a bolt upon all fours, something like the awkward jump of a horse at a standing leap when his head is confined, but not quite so rough; for, there being no bar in the way, the horse does not attempt to jump *perpendicularly* (if I may be allowed the expression) but forward, evidently intending to force himself out of the rider's hands, and spring from under him. Therefore, when you perceive the horse inclined to play these tricks, you, as a matter of course, prepare yourself for the encounter in the manner just described, applying both hands to the reins, &c. The body must be kept upright, but very flexible, so as to accompany every movement or action of the horse, and be thus prepared to repel every effort he may make (the corresponding motion, so frequently mentioned, can never be too strongly impressed on the mind of the rider). Your balance will be assisted by the close adherence of the thighs; the legs kept close to the horse, but not severely pressed till you feel the necessity; for the horse will be in alternate motion with his fore and hind legs, and you know not whether he will rear or kick. If he lifts his fore legs, thrust your rump out behind, by which you are prepared if he rears; as the fore feet come to the ground, slip your breech under you, and you become ready for his kicking or springing forward, the legs being in a situation to grasp at the instant, while a steady hold with the hands operates as a restraint upon the horse, and keeps him from falling.

Every unruly or vicious horse will be found to adopt or put in practice his own peculiar mode of offensive or defensive operations: some rear, others kick, some turn short to the left, others to the right; some run sideways against a wall, some refuse to do what they are required, others will only offer battle when they perceive they have the advantage of situation. But it is not possible to enumerate all the stratagems to which a horse will resort for the purpose of foiling or throwing his rider. However, of all the means resorted to by the horse for the accomplishment of his purpose, *rearing* is the most dangerous: a rearing horse will sometimes rise so unexpectedly and so rapidly, that the rider has very little notice or time to prepare himself:—some of them will rear so high as to be in danger of falling backwards; but a horse addicted to this violent rearing is scarcely ever

known to kick; the rearing, therefore, is what you have to guard against, and when he takes you unawares, your body must instantly incline forward close to his neck, your hands forward, on each side, so as even to clasp him round the neck, should that be rendered necessary—and it will where a horse resorts to such desperate rearing.

Nor are horses very easily cured of this very dangerous vice; that is, if they be viciously inclined, and determined rearers. Some will rear from playful excitement, but this amounts to nothing, as they never rise to any alarming height.

When a determined rearer is playing his vicious pranks, an active and a thorough horseman may, when the horse's fore legs are in the air, slip off, on one side, (keeping the rein in one hand) and pull the horse over backward. This operates most powerfully in subduing the horse, and he will seldom give you an opportunity of repeating it; that is, he will be careful how he rears again with the same rider. But such an experiment should never be attempted by any but an expert and clever horseman, one who feels perfectly conscious of his ability to perform it with safety to himself. And after all, it only remedies the evil as far as relates, to the rider who performs it; since if a determined rearer, after having been thus subdued, passes into the hands of another person, he will generally have recourse to his old but not forgotten tricks.

A person, named Godwin, who resided at the village of Daresbury, in Cheshire, purchased a vicious rearing horse; but as the animal was well calculated for a hunter in all other respects, and Godwin being a good horseman, he took the horse into the fields in order to induce him to commit the fault, that he might have a proper opportunity to administer the remedy. Godwin threw the horse backward, and while the animal was on the ground, he kept him down for some little time, during which he applied severe correction. Godwin mounted again, and the horse went as quietly as possible. This man rode him after Sir H. Mainwaring's hounds, and no horse could go more steady, and few could perform so well. He was purchased by the gentleman just mentioned, and came into the hands of W. Head, the huntsman, when he refused obedience, and again took to rearing:—I never recollect having seen a more vicious or determined rearer. The huntsman, being a good horseman, contrived to subdue him, but not till after a number of struggles for the mastery had ensued between them, as Head did not resort to the dangerous expedient of pulling him backwards. I afterwards saw this horse carry the huntsman very steadily, but evidently more from fear than good will, as was apparent by the expression of his eye. I believe the horse was quiet in the stable, which is the case with many similarly unruly horses.

In preference to the dangerous experiment of pulling a rearing horse backward, I recommend the adoption of the following method:—whenever you perceive the horse's inclination to rear, separate your reins and prepare for him: the instant he is about to rise, slacken one hand and bend or twist his head with the other, keeping your hands low. This bending compels him to move a hind leg, and of necessity brings his fore feet down.

Instantly twist him completely round two or three times, which will confuse him very much, and completely throw him off his guard. The moment you have finished twisting him round, place his head in the direction you wish him to proceed, apply the spurs sharply, and he will not fail to go forward: if the situation be convenient, press him into a gallop, and apply the spurs and whip two or three times (but not more) severely. The horse will perhaps not be quite satisfied with the first defeat, but may feel disposed to try again for the mastery. Should this be the case, you have only to twist him, &c. as before, and you will find that in the second struggle he will be much more easily subdued than on the first occasion—in fact, you will perceive him quail under the operation. It rarely happens that a rearing horse, after having been treated in the way described, will resort to his tricks a third time. But, on going into other hands, and having another rider, he will be very likely to have recourse to rearing.

All vicious horses have a favourite side, which they are prepared to defend, and they therefore must be attacked on the other.

It has been already observed, that a horse addicted to rearing high, seldom, if ever, kicks; and, on the contrary, a horse given to violent kicking, is scarcely ever known to rear. If you follow the directions given in the fifth paragraph of this article, he will not be able to kick, or at least only in a trifling degree; and finding himself foiled, he will not long continue the battle. In this case, twisting the horse round will have the desired effect; and indeed there are few cases of unruly horses where it will not: to accomplish which you must twist him round on his weak side, as he will be prepared for you on the other, and you would not be able to move him round; but in no case correct a horse beyond the just measure of punishment, let it also be well-timed, and administered without passion—lest you provoke him to further resistance. Whatever feeling influences the rider's mind, it will not fail to have a corresponding effect on that of the horse; and, consequently, cruelty, anger, and revenge, will operate most powerfully against that concord which should subsist between the horse and his rider. With an unruly horse, the rider should be as cool, as firm, and as philosophic as a Stoic. The moment the battle is over, let the horse and his rider become friends: the horse, being ashamed from defeat, will be thus soothed and brought into good temper; and, as all provocation has ceased, he will feel no disposition to renew the contention.

**PRESERVATION OF POTATOES.**—A farmer in the neighbourhood of St. Alban's, an extensive potato-grower, has lately discovered a cheap and simple mode of preserving that valuable root. A pit is dug the required depth, the bottom of which is lightly spread with gas tar, over which is placed a layer of tanner's bark to the depth of three inches; the usual quantity of wheat straw is then laid over the top. By these means he has this year preserved two pits; the one has recently been opened, the produce of which, from its soundness and freshness, has been justly praised by his neighbours. It is likewise worthy of mention that the bark after this process, proves an excellent top dressing for wheat, even superior to soot.

## AGRICULTURAL MEETINGS.—WHAT MUST THE FARMERS DO ?

(To the Editor of the Yorkshire Gazette.)

SIR,—The various agricultural meetings which are now holding, and have lately been held, have excited considerable interest, and the cry is, that the farmers are bestirring themselves; and so they are, when compared with the listless inactivity they manifested, in anything wherein their interests were concerned, some three or four years ago; but after all they are nearly powerless. Their weakness consists in this, they have no unity of purpose—they have no head. Scarcely two societies are based upon the same principles;—scarcely two agree as to the nature or extent of the relief they want. I make these observations in consequence of the refusal of the York Agricultural Association to send delegates to the proposed Aylesbury Meeting, because I think that a want of mutual communication between the various associations, and a knowledge of their views, feelings, and principles, are such serious defects, as to paralyze the exertions of the whole.—The Marquis of Chandos has, indeed, by his indefatigable exertions, proved himself to be “the farmer’s friend,” and the agricultural interest has every thing to expect from his support, provided his efforts are stoutly and perseveringly seconded. From previous letters which I have addressed to you, (and here I beg to express my thanks for your readiness in giving publicity to anything likely to prove beneficial to the Agricultural interests,) it will be remembered, that my opinions of agricultural distress, and its remedy, were, that much of it rested with the landowners themselves, and that the destruction of the large-farm-monopoly, was the principal (though not the only) means by which our distress may be alleviated. The increase of the poor-rates, and consequently of the expense at which the farmer raises his corn;—the diminished consumption of farm produce, and the undue influence of the large farmers on the markets, I have stated, are the causes of our depressed condition, and the results, in a great measure, of the system of letting large farms.

At a recent meeting of the Manchester Agricultural Society, I am glad to find this subject was introduced by J. Forenby, Esq., of Everton, in a speech replete with sound reasoning and good sense; and which at once evinced a deep interest in the welfare of Agriculture, and an extensive practical knowledge of its wants and prospects. To that speech I refer the farmers, and will just quote the conclusion. “The conclusion he drew from these facts was, that it would be advisable, where it was practicable, to divide large farms into small ones, and this important consideration he wished to press upon the attention of the landowners present.” To this we find a sort of interrogating reply, by a Mr. Dixon, who is represented to have inquired—“if large farms were to be divided into small ones, where would be the men of capital, reading, and intelligence? On the contrary, his opinion was, that if farms were made sufficiently large to require and induce the introduction of persons of intelligence and capital, agriculture would be much more improved than by making large farms into small ones.” Now if these assertions are correct, what relief would dis-inheriting the small farmers, and sending them to the poor-house afford to agriculture; for to the poor-house they must go if their farms were taken from them. It might possibly favour the monopolists, but it would terribly affect the welfare of the community, and add to the present agricultural burdens. But is there no intelligence, no reading, amongst the small

farmers? What folly to suppose this! There are ignorant persons among them, certainly, but there are certainly as many in proportion, and more, amongst the large farmers, who frequently commit their concerns to a hireling bailiff. But he inquires about capital. Now the temptations which large farms hold out to persons to take them above the extent of their capital have been the ruin of thousands, and in short the result has been, that scores of farms are thrown into a state of ruinous sterility, which had they been apportioned out so as to meet the capabilities of small capitalists would have been abundant and productive, and have afforded an independent livelihood, and constant employment to hundreds of families. But all their “capital” would never have been able (supposing large capitalists would engage in agriculture) to maintain the vast numbers of homeless small farmers, which this consolidation of farms would throw upon their support.

But Mr. Dixon must never have considered his position, when he says, “the making of small farms into large ones” would “require and induce the introduction of persons of capital and intelligence.” Where, I beg leave to ask, would they be induced to come from? Would they leave manufacturing, their trading, or their commercial professions to improve agriculture? The small capitalists he would certainly exclude; he admits it. But who engaged in any profitable employment, would leave it for any agricultural speculation? And if they should, what improvements are we to expect from persons unacquainted with the very theory of agriculture. His plan would send to their parishes those who understood and had been bred up to farming occupations, and introduce ignorant inexperienced persons, who would destroy the very vestiges of British agriculture. But this is not a question of improvement, but of the wealth and existence of the agricultural community.

But we now come to the question—what must the farmers do? Let them rally round a head, and let them endeavour to impress upon the landowners the evils of the large farm system. It is not high rents, it is a poor rate of from 2s 6d to 3s in the pound, and which is equal to 5s and 6s in the pound, when farm produce was selling at double the price at which it is going at present, and the less consumption of farm produce, both caused principally by the ruined small farmers, and diminished demand for labour, which produces our distress.

I trust this subject will be entered into at your meeting at York, (for although it is on the day of the publication of this paper, yet this will be read by the principal part of the farmers, ere they assemble) and if it appears to be necessary I have no doubt but the landowners, ever ready to do their utmost to render a service to agriculture, will adopt the plan of dividing large farms, to the extent of one hundred and fifty acres each. I remain, your’s,

A Practical Agriculturist,  
Yorkshire, Nov. 10th, 1833. W. E. N.

PATENT HORSE SHOES.—A newly-invented horse-shoe has just been invented by Mr. Gregory, formerly of this town, and late of Ilminster, veterinary surgeon, which promises to be of vast public benefit. A patent has been obtained for it in concert with another person. The shoes are produced by steam engine operation, at the rate of three thousand per hour, and are sold at two-pence each! (being about one-fourth the general cost of a horse-shoe!) An intelligent coach proprietor of this town affirms, that having tried them on horses over a rough road, he has found them to last longer than those of ordinary manufacture.—*Taunton Courier*.

## THE LANDOWNERS AND THE CORN-LAWS.

MR. EDITOR,—I have read, very attentively, Earl Fitzwilliam's Second Address to the Landowners on the Corn-laws. This subject is of vital importance to all those who are so unfortunate as to have their capitals vested in tillage, as well as to the landowners themselves. To a certain extent the interests of both are the same, and many of the arguments used hinge upon expected good or evil to the present occupiers of the land, as must naturally be the case in discussing this question—a question which demands the deepest consideration, for its importance is second to none; and I am feelingly convinced of the truth of Mr. Burke's remark, that "it is dangerous to make experiments on the farmer, whose trade is a very poor one, and whose capital is much weaker than is generally imagined." I propose to examine the strength of his lordship's reasoning, particularly as the authority of his high rank and individual respectability may possibly give more weight to his opinions than his arguments might gain; I mean with those well-meaning persons who have not much considered the subject, and with that large class who are predisposed to his lordship's views by their own separate interests.

It does not seem to be his lordship's intention to recommend a free trade in all the products of industry, nor does it appear that he contemplates any protecting duty at all for corn, but merely "such a duty as may be fairly levied for purposes of revenue." Now, surely this is very unreasonable in the present state of things. Almost all writers on political economy freely admit the just claim of the English grower to such a duty on imported corn as would "countervail the peculiar burdens to which he is subject." Mr. Ricardo allows also a drawback on exportation, "which he must have to place him in a fair state of competition in the foreign market, not only with the foreign producer, but with his own countrymen, who are producing other commodities." (Protection to Agriculture, page 53.) This is clearly justice only, and no favour, so long as the peculiar burdens remain; but it would be better to obviate the necessity for all this by taking them off, if possible (as the aggregate amount of them might be matter of dispute), and so to equalize general and local taxation, that every class might bear its fair share. If the above scheme (of Mr. Ricardo's) were adopted for the grower of corn, no other class of producers could justly claim any *protecting duty* at all, except on the proof of their *peculiar burdens*. It is well known, however, that almost every home-made commodity is protected, at present, by duties varying from 15 to 60 per cent. on the importation of similar articles; but this is seldom mentioned, and all the odium of *monopoly* is thrown on those connected with the land. I scarcely know what to think of the noble earl's serious proposal to the landowners to surrender *all corn-laws*. I have always considered "that the restrictions on the import of foreign corn were part of a whole system of restriction, devised and continued for the purpose of encouraging both domestic produce and domestic manufacture; that the grower of corn is no more a monopolist—no more a gainer by protection than is the watchmaker, the hatmaker, the shoemaker, the glover, the manufacturer of paper, of silk, of brass-work, of woollen, of cotton, of porcelain, of carriages, of everything. Destroy the whole system of protection and prohibition and even then you will have to consider whether the burdens upon the land are not unfairly laid—whether the produce of the

land, malt for instance, is not taxed in a degree which, although the tax is paid by the consumer, unduly encourages the consumption of other articles, to which, but for the tax, malt would be preferred. Is it just that the land should bear so large a proportion of the expense of maintaining the roads, and of administering criminal justice, when the large towns, the congregation of masses in manufactures, contribute so much more than the land to the production of crime?" "I contend, then, that before you determine to take off the restriction on the import of foreign corn, you ought to look at the burdens to which the landholder is subject, and at the difference of degree in which those burdens, whether local or public, press on the landed proprietor and the manufacturer respectively. Consider the land-tax, the malt-tax, and the payment of tithes—for tithes are admitted, by all political economists who have written on the subject of free trade in corn, to be a tax peculiarly burdensome, and for which the land is intitled to equivalent protection." "The amount of poor-rates paid in 1823, which, though it may refer to a somewhat remote period, will yet show the proportionate pressure of that impost upon land and upon trade. The total amount of poor-rates paid in 1823, in England and Wales, was 6,703,000*l.* Of this, dwelling-houses paid 1,762,000*l.*; the land 4,602,000*l.*; and mills and factories only 247,000*l.*—namely, one-eighteenth part of the payment of the land. I ask, therefore, can it be said, after such a statement, that the local burdens are fairly apportioned between the landed and manufacturing interests? And have not the proprietors of the land a right to claim, on this head alone, that degree of protection for their property, which is equivalent to the excess of contribution to which the land is subject."—(Sir R. Peel's Speech in the House of Commons, March 19, 1834.)

The theoretical objection to restrictive laws in general, is this, that they may sometimes interfere with the natural direction of capital, and thereby tend to diminish the sum of national profits; still protection is allowable so far as to compensate for any peculiar burdens, either on the land or manufactures. The question of general free trade, on the equitable principles of Mr. Ricardo, would be a fair subject for discussion, if there was a chance of obtaining a trade really free in everything (corn included.) There are certainly some objections to the *present system of corn laws*, pointed out by his lordship, such as a tendency to encourage the employment of English capital in speculating exclusively in foreign corn; also to raise the average price for the whole year (including foreign and English corn) to the *consumer*, more than the average price to the *home grower*. They excite much odium at home and abroad, and therefore afford no safe ground of security or confidence to those interested in their continuance; still an unrestricted free trade in corn would be unjust, both to the landowners and to the present occupiers, who cannot withdraw their capitals. It would be unjust and impolitic; for by opening our ports, under the present circumstances of Europe, we should not obtain a trade in corn *really free*, as the restrictive systems which prevail in France, Spain, Portugal, &c. would not allow of "reciprocity" in the corn trade. France, for instance, permits the exportation of her corn *only until the price reaches 4*9*s per quarter, and then it entirely ceases*; and our own corn would certainly never be admitted into France, unless her prices were such as to indicate scarcity. This is not a free trade; and shall we permit other nations to send their occasional surplus corn here, *whether wanted*

or not, whilst they will never take any of ours, however cheap, unless they may choose to do so? Such a trade in corn would be not only unfair to our growers, but it would subject us, as Mr. Malthus well observes, "to more cruel and distressing variations than the most determined system of prohibitions." (See Malthus' Grounds of an Opinion, &c., page 12 to 15; see also Huskisson's Letter to a Constituent, *passim*.) His lordship is under a great mistake as to the present state of the English farmers, and the effect which the fall of price has had on their capitals. I refer him to the reports of the two last parliamentary committees on agricultural distress, particularly that of August, 1833. His lordship says, "the average is now 40s. per quarter, and the occupiers of the soil have ceased, for many months, to reap the benefit which they were taught to expect from the protecting statute, nevertheless they are in a situation quite as prosperous as when wheat was at 6s." I ask, how can this be? Have the rents, tithes, poor-rates, price of labour, and other outgoings, fallen in proportion? Have all the various commodities required in the consumption of the farmer's household fallen equally? Certainly not; nor will they so for a long time, if ever; and during the transition, the farmers' capital must melt away. Corn is relatively low, and the occupiers of the soil are far from being as prosperous as when wheat was at 6s. The assertion seems like a cruel mockery; it shows, at least, an utter disregard of facts, and a great love of theory. His lordship evidently expects permanent low prices from a repeal of the corn-laws, and yet he thinks the alteration in the value of land will be "exceedingly trifling," and that "the fall of rents will not be great, except in a few cases." Now I ask, did not the doubled war-prices of corn double the rents? and if corn fall permanently to the old prices, must not rents fall to the old standard too?—nay, lower; for as taxation, general and local, cannot fall equally, how can rents be kept up even to the old standard? They are not yet at that standard, but probably 30 or 40 per cent. higher, having been fixed on the basis of 6s per quarter for wheat. I always admired and praised the (supposed) disinterested conduct of those landowners who, like his Lordship, advocate a free-trade in corn; but if they really expected nearly the same rents, and to have corn and the produce of the land cheap at the same time, no such praise is due to them, for then they would gain by it. But this is idle and absurd; for with a free trade, the English grower could not recover from the consumer, as heretofore, by an addition to the price of his produce, the amount of those burdens and taxes, direct and indirect, which affect him peculiarly, as compared with his foreign competitor; and this must, in the end, fall on rent. A little reflection on the nature and causes of rent will show, that if prices fall with only average crops, rents must fall in proportion, unless, indeed, improved methods of tillage are discovered, so as to make the capital and labour applied more effective; and without this, falling rents must be accompanied by the abandonment of the least productive soils. His Lordship thinks that none but the inferior soils will be thrown out of cultivation; and "these lands," he says, "are either unusually sterile, or unusually expensive to cultivate." First, as to sterility, I assert that they afford as much produce as the average returns of the corn-exporting countries, as stated by Mr. Jacob—namely, eightfold. Sterility, therefore, is not the cause why they cannot be kept in tillage. Some of them afforded a profit fifty years ago, with prices as low as at present; such prices will not do now,

because they are become "expensive to cultivate;" but this is entirely the effect of increased, direct and indirect, taxation, which has the same effect as sterility precisely. If these lands were naturally more "expensive to cultivate," or naturally more sterile, than foreign lands; or if the English cultivators possessed less skill or industry than foreigners, then, indeed, the reasoning, and attempted illustration, by a comparison of old expensive machinery about to be superseded by new, would apply to the case; at present it does not, since the best machinery may be made expensive by taxation. The whole of the argument here is a misrepresentation, and unjust towards the owners and cultivators of such lands. If even one class of land should be driven out of tillage by foreign competitors, who carry less weight (of taxation) the owners of it will be unjustly treated. His Lordship seems to think cheap corn, however produced, the *summum bonum*; but it is not so much cheapness, as the ability to purchase, which is desirable. Look at Ireland and Poland. If corn is made cheap by importation, and the demand for labour and wages should fall more than corn, certainly nothing would be gained by it. "The history of the country for the last 170 years clearly proves, on the one hand, that cheapness produced by foreign import is the sure forerunner of scarcity; and, on the other hand, that a steady home supply is the only safe foundation of steady and moderate prices." (Huskisson's Letter to a Constituent; Chichester, 1814, pages 7 and 8). Again (pages 10 and 11), "I admit, that if unlimited foreign import were now again allowed, bread might be a little, though a very little, lower than it now is, for a year or two; but what would follow? The small farmer would be ruined; improvements would every where stand still; inferior lands, now producing corn, would be given up, and return to a state of waste; the home consumption, and brisk demand for all the various articles of the retail trader, which contributed so much, even during the pressure of war, to the prosperity of our towns, especially those which are not connected with manufactures or foreign commerce, would rapidly decline; farming-servants, and all the trades which depend on agriculture for employment, would be thrown out of work; and the necessary consequence would be, that wages would fall more rapidly than the price of bread. Then comes some interruption to the foreign import, coinciding with the decay of agriculture at home, and corn is suddenly forced up again to a famine price." Unlimited free import of foreign corn must certainly cripple the English grower, and all connected with land, under the present weight of taxes. Now, one-third of the whole population are directly employed on the land, and many more are dependent on it for a living; perhaps, altogether, two-fifths of the people; can it then be the interest, the permanent interest, of the monied, manufacturing, and other classes, to ruin such a large portion of the people? The cry of the large manufacturing capitalist for cheap corn means low wages; and it may suit his temporary purpose; but his interests are not so inseparably connected with the welfare of the country as those of the landowner and of agriculture. His Lordship seems to dislike the idea, that "low prices are inconsistent with the national welfare;" but facts are stubborn things; and it seems to be proved that low prices are invariably followed by an increased rate of mortality, and *vice versa*, amongst manufacturing "operatives" as well as agricultural labourers. ("Inquiry into the Expediency of the Existing Restrictions on the Importation of Foreign Corn, 1833, by John Barton). And why should this surprise us? It is written

"Man shall not live by bread alone." Many other things are necessary to him, and as the price of corn, *cæteris paribus*, regulates wages, low corn must make low wages; and the labourers' power to purchase other necessities is less than before: his command over corn is the same; but his command over other things is less; therefore his situation is decidedly worse. I have said that the price of corn, in like circumstances, regulates wages, and that when corn is relatively low, the receiver of wages suffers, because his command over every thing but corn is less. It is certain also, that the price of corn chiefly regulates rent, and when corn is relatively low as compared with other commodities, the receiver of rent must suffer; because, although his command over corn remains the same, yet his command over other things, and especially luxuries, is less than before, and he must suffer proportionally more than the receiver of wages, inasmuch as he spends a smaller proportion of his income on corn, and the produce of land; indeed, the proportional expenditure in these things is, probably, in the *inverse ratio* of income. The landed gentlemen residing in the country may, "as expenders of income, be more benefited by a reduction of the price of provisions, especially of grain, than the other classes of equal fortune residing in, or near, the metropolis," as consumers; but as producers and sellers (through their tenants) they must be still more benefited by a rise in the price of provisions, and especially of grain; for this must cause a rise of rent, and thereby increase, on the whole, their power of purchasing. Why have the landowners of late gone to reside on the continent so much? To get cheap bread and meat? No; but to obtain those comforts which they have a right to expect, and which they always had, until *hoc us pocus* changes of the currency, and other tricks, transferred to the tax-gatherer and mortgagee that portion of the produce of their estates which used to be *their share in the form* of rent. Will cheap bread and meat at home bring them back? No; but falling rents will drive away more of them; all, perhaps, except those Leviathan landlords—" Ces grands propriétaires, qui peuvent se croiser les bras, et qui n'ont d'autre affaire que leurs plaisirs, leurs revenus sont si grands qu'ils excèdent tous les besoins; mais leur nombre est toujours petit comparé à la totalité." (J. B. Say.)

Before we decide whether cheap corn and low prices, in general, would be beneficial to us, we should consider the peculiar state of this country. "During the twenty years beginning with 1794, and ending with 1813, the average price of British corn per quarter was 83s.; during the ten years ending with 1813, 92s.; and during the last five years of the twenty it was 108s. In the course of these twenty years the Government borrowed near 500 millions of real capital, for which, on a rough average, exclusive of the sinking fund, it engaged to pay about 5 per cent. But if corn should fall to 56s. a quarter, and other commodities in proportion, instead of an interest of 5 per cent., the Government would really have to pay an interest of 8, 9, and for the last 200 millions, 10 per cent. This can only be paid by the industrious classes of society and the landlords—that is, by all those whose nominal incomes will vary with the variations in the measure of value. The nominal revenues of this part of society, compared with the average of the last five years (ending 1815) will be diminished one-half; and out of this nominally reduced income they will have to pay the same nominal amount of taxation." (Malthus' Grounds of an Opinion, &c. &c., pages 38 and 39.) "If we consider with what an increased weight the taxes on tea, sugar, malt, &c.,

would in this case bear on the labouring classes of society, and what proportion of their incomes, all the active, industrious, middle orders of the state, as well as the higher orders, must pay in assessed taxes, and the various articles of the customs and excise, the pressure will appear to be almost intolerable. Indeed, if the measure of value were really to fall, as we have supposed, there is great reason to fear that the country would be absolutely unable to continue the payment of the present interest of the national debt. Even if the price of corn be kept up by restrictions to 30s. a quarter, it is certain that the whole of the loans made during the war, will, on an average, be paid at an interest very much higher than they were contracted for, which increased interest can of course only be furnished by the industrious classes of society. I think that very much the largest mass of the people, and particularly the industrious orders of the state, will be more injured than benefited by this measure." (The Opening of the Ports, pages 40 to 42). Whether we open the ports or not, much of the above described suffering must now be our lot; for the "sound currency" people, with their allies and supporters—the vampire-race of loan jobbers and Jew money-dealers have outwitted, and deluded, the owners of real property, to the great injury of the producing classes, and the permanent degradation of the landed and agricultural classes in particular. The interested, selfish, and cunning advocates of free trade amongst the monied, commercial, and manufacturing classes, must be highly delighted to have as an ally a large landed proprietor of his Lordship's high rank and character, but how must they *laugh in their sleeves* at his Lordship's *simplicity* in supposing that "the alteration in the value of land will be *exceedingly trifling*," and that the "fall of rents will not be great, except in a few cases, after a repeal of all Corn Laws!" But the dull perception of the landed and agricultural people is well known, and their patient endurance not less so. Sir Robert Walpole, in his time, compared them to sheep, who always came very quietly to be shorn; the manufacturers, he said, were like pigs, if he touched but a bristle of them they were all in an uproar, and then there was, he said, "more cry than wool!" His Lordship asserts that there exists at this time "general prosperity" amongst the industrious classes; but as he asserts at the same time, that farmers are quite as prosperous now, with wheat at 40s. per quarter as when it was at 64s., which is notoriously unfounded, the former fact is doubtful; indeed how can "general prosperity" exist when so large a body as the agriculturists are going to ruin! The following is a curious passage:—"We have for some years been so much accustomed to hear of the Corn Laws as a sort of national code, that many of us imagine that the system is as old as the common law and the constitution itself, and that it forms, as it were, part and parcel of our political existence; while, on the other hand, the more experienced must be perfectly aware that it is of recent introduction and novel in England." Now what is meant by this? Surely not, that all Corn Laws are of recent introduction and novel in England, as the uninformed reader might suppose; if so, I refer him to a "Compendium of the Laws passed from time to time for regulating and restricting the Importation, Exportation, and Consumption of Foreign Corn, from 1660; printed for Ridgway, 1833." Perhaps it means only that the *present form of Corn Law* is of recent introduction; but, as now worded, it is calculated to mislead the ignorant and unwary, and it ought to be more explicit. I cannot imagine why his Lordship should confine his efforts to ob-

tain free trade in *corn only*, instead of taking up the broad principle of general free trade, on the plea that the capital and industry of the people might be employed to the greatest advantage; this would be more plausible, but would prove, I fear, visionary also. If free trade is to begin with corn, as some propose, justice requires the previous removal of all peculiar burdens on the land; even now it is suffering from unfair competition with untithed, unratred, and comparatively untaxed, Ireland, Canada, Man, and Channel Islands. Should the general good of the nation be found *clearly* to require the partial evil of sacrificing (by free import of corn) a large portion of the land-owners, farmers, and their labourers, be it so; but at present the evil only seems certain, and the expected good, contingent. The adoption of abstract theories frequently disappoints expectation. Should the "stern path of duty" demand the sacrifice, we must submit; but let not his Lordship expect to convince either landlord or farmer that it is for *their good*. By a debtor and creditor account of a farm, as it stood seven years ago, and for the past year, I might easily show that farmers are not now *nearly* "as properous as when wheat was at 6s. per quarter," and might prove the necessity for a large reduction of rent with low prices; but I fear our modern economists pay more attention to theories than to facts and experience. Political economy is a noble science; but our present professors of it seem likely to bring it into disrepute. It was said, I think by one of the ancients, "that there was nothing, however absurd, which had not been asserted and maintained by some one of the philosophers;" this remark seems equally applicable to our present race of *psuedo* philosophers. As one proof, among many, I refer the reader to a whimsical production, called "An Address to the Farmers of the United Kingdom, on the Low Rates of Profit in Agriculture and Trade, 1831," by R. Torrens, Esq., M.P.—a writer, who has occasionally proved himself capable of better things.

I am, Sir, your obedient servant,

TERRÆ FILIUS.

West Sussex, Nov. 24, 1835.

## THE MALT TRADE.

The following is an extract from the Appendix to the Fifteenth Report of the Commissioners of Excise Revenue Inquiry:—

TO SIR HENRY PARNELL, BART., CHAIRMAN.

"Twickenham, Sept. 10.

"MY DEAR SIR,—I am afraid that the evidence which I gave on the question of the malt duty did not seem quite so clear as I could have wished it; and I am fain to trouble you with a few lines in explanation, relying on your goodness to excuse me. The desire of government must, of course, be to levy the tax upon every quarter of malt which is made, and with equal fairness to each trader. For this purpose it has imposed certain restrictions upon the trader, and appointed particular gauges to be taken, whereby the tax or duty is estimated. In despite of these restrictions there is abundant evidence to prove that fraud is frequently practised: and it would be most desirable if such alterations could be made in the manner of charging the duty, that it might be levied with greater certainty to government, and at the same time hold out less inducement to the trader to practise fraud. To obtain this I would at once take off all restrictions in the manner of working grain. I would let the maltster use his own judgment, and if he could, out of one

quarter of barley make two quarters of malt. It cannot matter to government how much the maltster makes of his barley, provided he pays regular duty for every quarter of malt. Besides, the present restrictions have this injurious effect:—the trader does not like to be deprived of the use of his judgment, and be told that he shall only work corn in such or such a manner, although his experience may have pointed out a way to him, by which, without defrauding the revenue, he might procure greater profit to himself. I do not say such is the case, but every man likes to use his own judgment in his own affairs. Take off then all restrictions about liquoring the corn on the floors and so forth, (let the Excise officer still continue to gauge the corn, if that would be any satisfaction,) and let the duty be levied when the malt is made, that is on the last day on which it will be on the kiln, as near as possible to the time of its being thrown off. For this purpose a book might be kept at the malt-house, in which the maltster should be compelled to enter the hour in which he means to throw the malt off the kiln, and let the penalty for his omitting so to do be treble or five times any of the present penalties. The maltster should give twenty-four hours' notice of his intention to throw off the kiln, and during that twenty-four hours the officer should come to gauge the goods—leaving, if the maltster so direct it, a copy of his charge. The allowances to be made for heat and roots must be a matter of consideration, but I should think about twelve per cent. I cannot see any objection to this plan; the government would, it appears to me, ascertain with greater precision the actual quantity of malt made, and the trader would not have opportunities of practising fraud. The room into which the malt would be thrown from the kiln should be adapted to the size of the kiln, and separated from the room where the malt would be stowed away or kept for sale, by a partition of four or five feet in height. The partition should not be higher, as it would inconvenience the labourers in throwing the malt from what might be termed the shifting-room. Care should be taken that no other malt be in the shifting-room, except that thrown from the kiln. Let the penalty for throwing off from the kiln, without such twenty-four hours' notice, or of sprinkling malt already thrown off be five times the amount of any present penalty.

"I must now endeavour to prove that the *present system of charging the duty by different gauges on the floors and in the cistern is incorrect*. The gauges on the floors at one period allow one-third, and at another one-half. I will not say much about those gauges, for in my opinion the maltster can even now work his corn so as to get what increase he wishes; the restrictions only make it a little more difficult. The gauge in the cistern causes the incorrect charge, for the state and quality of the barley and the heat of the atmosphere will affect the rise or swell of the corn when in cistern. I will make the calculation by my cistern. I generally put in steep forty quarters, and the depth of corn, in inches, is twenty-eight; the rise to be in proportion with  $1\frac{1}{2}$  per cent., should be about five inches and six-tenths, whereas it is generally between six and seven inches, and sometimes eight; when it rises eight inches I am charged two quarters, three bushels *more* than I have steeped; and if it only rose five inches six-tenths, I should be charged three bushels *less*. If, in the first case of my cistern rising eight inches, I wished to overcome the extra charge of two quarters three bushels, I should be obliged to force the corn to work on the floors, and strive for increase, which would be injurious to me as the consumer of malt; in the latter case of its only rising five inches six-tenths, the closer I worked the less duty I should have to pay. I will place the calculations in juxta-position that you may be able to see at once the different results, calculating the first rise of my cistern, not at the extreme of eight inches, but the more general one of seven inches, and work accordingly for increase, but still for as small an increase as would be consistent with my interest as a consumer. My next calculation will suppose the cistern to rise five inches six-tenths, and work the corn closely.

*First Calculation, Cistern rising 7 inches.*

In.	Qrs.	In.	Qrs.
25	give	40	35
		give	.....
		Deduct allowance of 17½ per cent.	50 6-8
			9 4-8
			41 2-8
41	2-8	increase within 72 hours to	63
		Deduct one-third	21
			42
63	increase afterwards to		80
		Deduct one half	40
			40
		Cistern charge	41 2-8
		First charge on floors	42
		Second do. do	40
			3/123 2-8

Divided by 3, to make charge for duty... 41 3-4  
or 1 quarter 3-fourths more than was steeped.

*Second Calculation, Cistern rising 5 inches 6-10ths.*

In.	Qrs.	In.	Qrs.
28	give	40	- 33 6-10
		give	.....
		Deduct allowance of 17½ per cent.	48
			39 3-8
39½	increase within 72 hours to		60
		Deduct one third	20
			40
60	increase afterwards to		70
		Deduct one-half	35
			35
		Cistern charge	39 5-8
		First charge on floors	40
		Second do. do	35
			3/114 5-8
			38 5-8

or 1 quarter and 3-eighths less than steeped.

“Surely that calculation proves that the error in the present system is in the cistern charge. It may be true that in the first calculation I got the increase of one quarter and more, and therefore pay no more duty than I have made malt; still it is injurious to me as a consumer, and forces me to work the corn for increase, and which I otherwise would not. This very *compelling* the trader to work for INCREASE appears to hold out some inducement to the not strictly honest to attempt fraud, and even the fair trader must use his best endeavours to convert his quarters of barley into as many possible quarters of malt, leaving the sagacity of Excise-officers to make a correct or erroneous charge. In my case, who work for weight, not increase, the paper which I left on my examination proves that I am overcharged; if my plan were adopted I expect that better malt would be made, and, from want of temptation, less fraud practised; still there are some who would attempt fraud, and in this way, either by throwing the malt from the kiln before the officer came to gauge, or by sprinkling malt already thrown off; in either case heavy penalties should be enforced, and the officers of excise use the greatest vigilance. It must be considered that porter or brown malt is worked in a different manner to pale malt, of which I have been treating, and therefore some alterations would be requisite in this plan, but the system might still be adopted. The present law makes a great distinction between malt, and porter or brown malt.

“I commence malting for the season about the middle of October; and, should you desire it, shall have great pleasure in keeping correct gauges of the corn from the time I steep till the time I throw off the kiln, and send the result to you; at the same time I fear, that the trouble which the perusal of this letter will cause you will make you wish that you had not trusted

to examine me at all; but if on the other hand there should by chance be any idea contained in it, which you may be able to turn to some useful purpose, I shall be amply repaid for writing it, and believe me,

Yours, very truly and faithfully,  
G. B. COLE.

ON DRILLING, OR DEPOSITING THE SEED IN LINES.

(From Sinclair.)

The system of drilling, or placing the seed of grain and other vegetables, in regular rows, by machines invented for that purpose, is no new discovery. It has been practised from time immemorial in the East Indies, and has likewise been long known in Spain. The introduction of that mode of sowing into this country, is justly attributed to the celebrated Tull, who founded it on the erroneous doctrine, that tillage, even without manure, would produce an endless succession of abundant crops. That theory is fortunately abandoned; but the practice of drilling, being now established on sound principles, and sanctioned by experience, is progressively increasing, much to the advantage of the farmer.

In discussing the subject of drilling it is necessary to make a distinction between leguminous, or green, and culmiferous, or grain crops.

DRILLING LEGUMINOUS, OR GREEN CROPS.

There is no question, but that the culture in rows is best calculated for them, because, 1. It carries off the extra moisture in wet soils;—2. it exposes more surface to atmospheric influence, by which the soil is ameliorated;—and 3. it gives an additional opportunity for the vegetation, and the destruction of weeds.

Beans should be drilled, not only on loamy soils, but even on strong and rich clays. When drilled, from the manner in which the plants grow, the pods are placed on the stem from the root upwards, and of course they must derive essential benefit, when filling, by the admission of air through the open space left between the drills. The soil is likewise meliorated by the hoeing, and weeds are effectually destroyed.

Drilling for turnips is likewise greatly to be preferred. The superior facility afforded by the drill culture, of simplifying and expediting hand labour; the advantages of applying recent and moist manure directly to the seed,—the more regular and correct adjustment of the number of plants to be left on a given space; and the more equal admission and circulation of air among the plants, entitle the drill system to a decided preference.

Potatoes, also, ought to be planted in rows by all farmers, whatever plan gardeners or cottagers, on small patches, may adopt. There ought to be a distance of from 24 to 30 or even 36 inches between each row, so that the fibres which nourish the plants, may not be disturbed by the hoeing, for if they are injured, the stems will be puny, and the bulbs few and small. Drilling is greatly preferable to dibbling potatoes, as appeared from an experiment, expressly made to ascertain the advantage of each mode of culture.

The drilling of carrots has not been found to answer in Suffolk; but it has succeeded in the experience of Mr. Butterworth and others, in Scotland, and of M. Chateaubieux, in Switzerland, with very wide intervals. This useful plant can thus be cultivated with profit, on soils where otherwise it would hardly be practicable; the drills furnishing an artificial depth of soil, in which this root can be raised. Four-

teen inches between the rows is recommended as the proper distance.

In regard to peas, whether sown with a mixture of beans, or not, drilling is to be preferred to the broad cast system, though the hoeing is attended with difficulty, owing to the plant falling so early down upon the surface. The rows ought to be from 20 to 27 inches asunder, and the intervals repeatedly hand-hoed. Any weeds that may grow among the peas may be pulled up by the hand. It has been found that peas properly drilled, and carefully hoed, were at harvest, nearly as clean as the beds of a garden, and the produce, both of grain and of haulm, quite satisfactory; whereas the head-lands, which had been sown broad-cast, had a miserable crop of grain, thinly scattered among a multitude of annual weeds, and scarcely worth reaping.

As to tares, they are sometimes drilled, particularly when sown in spring, but broad-cast is the more general practice, when sown in autumn. When drilled the rows should be fifteen inches apart; and in strong tenacious clays, this crop when repeatedly hand hoed, is said, in dry seasons, to be more profitable than beans.

#### DRILLING CULMIFEROUS OR CORN CROPS; WITH OBSERVATIONS ON THE ROW CULTURE, FOR CROPS OF GRAIN.

The question, whether it is most expedient or profitable, to raise culmiferous crops, according to the broad cast, or drilled system, has agitated the agricultural world for a number of years; and as it is a point, respecting which there still exists a great diversity of opinion, it may be proper here to detail the arguments on both sides, that the reader may be enabled to form a decided opinion, which ought generally to be preferred; and in what particular cases, either the row, or the broad-cast system of culture, ought to be adopted.

The arguments against drilling are, 1. That it is not likely to be profitable on a small scale, on account of the expense of the machinery for the different operations of sowing, hoeing, &c.—2. That these operations must often occasion delays, incompatible with the hurry of an extensive autumnal or spring sowing, at least in wet seasons, and on wet soils, however little it may be felt in dry seasons, and on dry soils;—3. That it is not so well calculated for steep lands;—and, 4. That the grain is more liable to be shaken by winds, and the harvest to be later on drilled fields, than on those which are sown broad cast, and, consequently, that it is not so well calculated for a windy and a northern climate.

Some other objections were formerly urged against drilling, which the recent improvements in the system have effectually removed. For instance, it was anciently the practice to earth up the plants, the consequence of which was, that in rich soils, the vigour of the soil was exhausted on the stems or foliage instead of the fruit; and though the straw was strong and abundant, the grain was often defective in quality, or greatly diminished in quantity; whereas, now, it is a maxim in the school of Holkham, "That white straw crops will be injured, if earthed up upon any soil."

It is likewise urged, that it might not be practicable in many districts, to find a sufficient number of labourers to hoe the drills, were all the crops on a farm to be subjected to that process. But in the present state of the country, with an overflowing, and unemployed population, a new source of occupation to the peasantry would be most desirable, provided their employers were remunerated for the expenses they incurred; and where there is a

scarcity of male labourers, women and boys have, in many agricultural districts, as in Gloucestershire, been taught the art, and have been found most expert at hoeing.

It has further been urged, against the use of the drill machine, that where seed has been steeped, and encrusted with lime, as a preventive of the smut, the lime destroys the brushes, and impedes the regular delivery of the seed. But this objection is easily removed, by using crops, instead of brushes, or by steeping the seed in a solution of the sulphate of copper, in a manner to be afterwards described, in treating of the diseases of grain, (see the *Addenda*); and the seed, in that case, might be sown in a few hours after the solution has been applied, without lime, and with a certainty of preventing smut.

It is also contended, that the drill machine does not answer where the soil is too full of small stones, which may prevent the coulters from sinking to proper depth, so that the seed may not be sufficiently covered, to produce an abundant crop; but Mr. Wilkie of Wimpole maintains that there is no difficulty in drilling stoney land provided a proper drill machine called "a clever drill" is made use of. The levers can be "weighted" at pleasure, and thus will answer in almost any soil, however stony, because that sort of soil is generally loose below, and better to drill on than even heavy cloddy land. The seed also will stand a better chance of being covered.

The introduction of the drill system is, by many of the most distinguished agriculturists, considered to be the most important of all modern improvements, and to be well entitled to universal adoption. It is principally recommended on the following grounds: 1. That the broad cast system is a less perfect, and a less economical mode of cultivation, than that of drilling, for the seed can neither be deposited in the soil, with the same exactness in regard to depth, regularity, or proportion, nor be so placed, that the crop can afterwards be improved in its progress to maturity;—2. That in light soils drilling has the important advantage of giving the grain a good hold of the ground, and of giving all the seed the same depth of soil, by which the frost is prevented from throwing out the plants in spring, or the wind from loosening the roots, after the stem gets high, or when the ear is filling;—3. That the plants of wheat in drills protect each other through the winter, and hence, that a field in drills will be more forward in spring, and sooner ready at harvest, than a field sown broad-cast;—4. That by the improved practices in drilling, the use of manures, (rape cakes in particular), is both encouraged and economized, so as to diminish the quantity necessary, and to increase its powers, by bringing it into immediate contact with the plant; and that a heavy crop of drilled corn, where the weeds are thoroughly destroyed, will be found much less injurious to the fertility of the soil, though raised with less manure, than the same crop grown broadcast, with a greater quantity of manure, but encumbered with weeds;—5. That it gives an opportunity for cleansing the ground, even when the crop is growing;—of completely extirpating annual weeds;—of checking the growth of root weeds;—and of preventing weeds in general, from being injurious to the crop;—6. That if the land is not hoed, but hand-weeded, less damage will be done to the crop, by the weeder's feet passing between the rows of plants, than by treading upon them, as must inevitably be the case, when working promiscuously over the ground;—7. That the progress of the

grain, after the sower has worked upon the soil, is attended with the most beneficial effects:—3. That drilling is peculiarly calculated for inferior soils, and brings their produce more nearly on a footing with that of fertile land, than could otherwise be obtained;—9. That the pulverization of the soil, between the rows of autumn or winter-sown wheat, is of the greatest benefit to the clover seeds sown in spring, and that the admission of air between the rows is of use to the corn crops, as well as to the grass seeds sown with it;—10. That drilled crops of white corn, from the greater strength of their straw, are less apt to lodge, or to be beaten down in wet seasons; and are much less subject to other casualties, in particular to the diseases which wheat is unfortunately liable;—11. That the expense of cutting down a drilled crop in harvest is uniformly less than one which is sown broad-cast since three reapers will do as much work in the former case, as four in the latter;—12. That drilled crops are more equal in growth, and that in general they produce a cleaner, and more regular sample for the market;—13. That drill crops can be harvested to more advantage, and sooner conveyed to the barn or to the corn-yard, than if they had been produced under the broad-cast system, in which less attention is paid to the destruction of weeds;—14. That drilling may be of use in regard to the grub, and other vermin, for that the hoeing in spring, the treading of the hoers, and the stirring of the soil by the hoes, must give a check to their depredations.

In regard to any saving of seed, which by some is considered an advantage, Mr. Coke of Holkham is decidedly of opinion, that such an idea is founded on erroneous principles, and that any economy of that sort ought not to be attempted. It is indeed of use to have the roots matted together, provided that there is substance enough in the soil to nourish the plants; and it is found, that wheat thrives best on a firm and compact bottom, which prevents the roots from being long and straggling.

Innumerable instances might be brought forward, of heavy crops having been produced under the drill system, by those who have bestowed much care in trying the experiment; and it has often answered, even on a greater scale, when properly executed. But its success must depend upon the intelligence, attention, perseverance and capital of the farmer.

As it has been carried to the highest perfection, and cultivated to the greatest extent on the farm and on the estates of that distinguished agriculturist, Mr. Coke, of Holkham, it may be proper to give a short account of his practice. He uses the Rev. Mr. Cooke's drill, which is drawn by a single horse, and sows six rows at a time, and an acre in an hour. His wheat he sows at nine inches asunder, his barley at six inches three quarters. The quantity of seed which he sows per acre, is three bushels of barley, and six of oats. In regard to wheat, the average quantity which he prefers, is four bushels per acre. By depositing such a quantity of seed, there is no occasion to earth up the plants, for the sake of promoting tillering. On rich soils, it is the practice to draw the drills from north to south, because the rays of the sun when in his greatest altitude striking directly between the rows of corn have a powerful effect in strengthening the straw, and by absorbing the damp from the earth become a powerful auxiliary in preventing mildew. On poor soils, on the other hand, the lines should be drawn from east to west, if the nature of the ground will admit of that plan being followed.—Cooke's fixed drill-harrow is used once in spring, the hand-hoe is used twice, the land

is cleared of weeds, but the soil is not earthed up, nor accumulated against the corn. The hoeings cost about twenty pence each per acre. The largeness of the crops, particularly of barley and oats, raised even on poor land, under this system, is hardly to be credited; and they are sometimes also of a superior quality.

## RESULTS OF THE SPAYING OF COWS.

By M. LEVRAT.

(From the *Veterinarian*.)

The VETERINARIAN for August last contains a memoir on the castration of cows, accompanied by several cases. These cases, however, were drawn up a very little while after the operation, and could only indicate the immediate effects of it. It may be useful, now that more than a year has passed, to describe the present state of the animals.

The cow which was operated on in June 1833, yields, when she is at grass, the same quantity of milk that she gave on the preceding year.

The second, operated upon in November 1833, gives when at grass, eleven *pots* (qy. quarts) of milk.

The third, spayed in December 1834, yields, when at grass seven *pots* and a half.

The fourth, operated upon in March 1834, gives more than nine *pots*. This cow, that was mischievous, and difficult to milk, seemed to be cured of her vicious habits by the operation; but she soon became as bad as ever, and is obliged to be hobbled in order to be milked.

Two of these cows shewed symptoms of œstrum as before. In one of them it was not periodical, as in other cows; the other, that had, as already related, a large yellow mass in the place of the left ovary, has been at heat several times. She has gone to the bull, which has quieted her for awhile, but the heat has returned at irregular intervals.

May not these facts lead us to believe, that the ovaries have only a secondary influence on the development of the œstrum, and that the uterus exerts the principal influence in the production of it.

In neither the one nor the other of these cows did the milk undergo any alteration in quantity or quality during the period of œstrum; while in cows that have not been spayed there is always a change to a greater or less degree.

As to the quality of the milk from cows that have been spayed, M. Francillon says, that it yields more and better cream than before.

The cow of M. Perdonnet, operated on in January 1834, continues to give when at grass, the same quantity of milk which she did at the time of the operation; but the milk, which had lost its cream for a few months after the operation, is now become richer than it was before. She has been at heat once only, and her milk did not undergo any change at that time.

*Rec. Sept. 1835.*

The Sussex Ox, bred by Mr. J. Fuller, lately of Mays Farm, and exhibited by his son, Mr. P. Fuller of Loughton, which obtained the first premium in class 1, at the Lewes Fat Stock Show, on Tuesday last, attracted the greatest attention, and was universally admired for the beauty of its symmetry. It was purchased by Mr. Henry Myrtle, butcher, of St. James's Street, Brighton.

## THOUGHTS ON THE EXTENSION OF DRAINING.

(From the Quarterly Journal of Agriculture.)

There is perhaps no circumstance which so obtrusively forces itself on the attention of the agriculturist as he travels along the highways of Scotland as the neglect of draining. In arable as well as in pastoral districts, among mountains as well as on the plains, this neglect is very striking. Many a field under the plough presents dark spots or blotches on the face of its acclivities, or still darker bands or patches on its more level parts; and many more fields in pasture show unequivocal symptoms of hidden water by the growth of semi-aquatic plants which varigate their surfaces in lines and clumps. Perhaps it would be too strong to assert that there is not a thoroughly drained *farm* in all Scotland, but there is no hazard in the assertion that a thoroughly drained *parish* does not exist in it. Startling as this intelligence must be to the agriculturists of England and Ireland who have long been accustomed to hear the husbandry of Scotland lauded as the most perfect system of agriculture in the world, it is no news to many farmers in Scotland. Full well they know that much improvement has yet to be effected by draining, and that in its train alone follows every other improvement. Far be it from our intention to depreciate Scottish agriculture. It is the most perfect system in existence. And it has made Scotland to be admired and envied by the world. Much of this perfection and state of admiration and envy in which Scotland is held must be attributed to draining partial as it has been. Though silent and secret in its operations, like wholesome medicine, draining has renovated the constitution of the soil, and suffused a healthful bloom over the face of the country. But since partial draining has effected such great and pleasing effects, what may not be expected for Scotland from thorough draining! The humidity and variability of the climate, operating upon the inferior soil which occupies a large surface of this country, must always render draining a desirable improvement. Indeed, with these pre-existing evils, it is difficult to conceive that period when draining should be overdone in Scotland. It is probably impossible, even by draining, entirely to counteract the effects of these never ceasing evils, but it is not impossible to ameliorate a humid climate and a bad soil by judicious draining. With draining, as hitherto executed, the climate is much drier and milder than it was half a century ago. Agues and miasmata are diseases now unknown to our rural population. The recent mildness of the winters, the absence of frosts and snows of long duration, and the presence of hibernal vegetation, indicate less ability in the soil to emit those dank exhalations which return in rain and snow from the atmosphere in its changeful flittings over our narrow island. This theory is at least as philosophical as the ascription of our gentle winters to the abruption of the polar ice. Those vast fields and mountains of ice may no doubt affect our climate generally with their frigid influence, and if that influence is commanding, it should be strongly felt in the ensuing winter, for the whale ships have this summer been unable to penetrate their barriers. But changes of climate are often partial, as may be witnessed in situations which are exposed to or sheltered from particular aspects. There is therefore no unreasonableness in ascribing even a general change of climate to extended

and simultaneous ameliorations of soil over a whole country. Were draining extended to its utmost pitch of ability, it is impossible to anticipate the exact degree of favourable change which the climate would experience; although the obvious connexion existing between the climate and the soil, would warrant the anticipation of an important change. But which of them possesses a prevailing influence? The climate certainly influences the soil. The humid climate of Scotland renders the soil humid. And the dry climate of Egypt doubtless renders its soil dry. But is the influence reciprocal? The influence in this case as cause and effect is not so obvious. But, at least, does not a dry soil produce a less humid climate? We say so, and the general belief so tends. May not the excess in drought of the Egyptian soil and of the great sandy deserts in Africa, prevent rain falling in those countries? We say so, and the fact can be scientifically explained. No farther proof, then, is required to induce to the belief, that were draining prosecuted till the soil of Scotland were rendered dry, the climate of Scotland would be less humid by the change. At least this much may be safely asserted, that effectual draining would render a humid climate less noxious to every kind of crop; and such degree of security ought to be a sufficient inducement to drain extensively and effectually. But an examination into the manner that humidity affects the soil, will enable us to ascertain how draining first ameliorates the soil and then the climate.

When rain falls on the ground, part of it runs off into ditches and thence into rivers; but the greater part is absorbed. Plants consume much of this absorbed water; some of it descends into the bowels of the earth, and some only as far as the superior strata of alluvium and rock, by which it is repulsed to a lower level, where it afterwards finds its way to the air in springs through the cultivated soil, and thence into rivers; but a greater proportion of it only descends as far as the subsoil, which, if impervious, retains it. That which makes its appearance in springs is generally easily led away in drains made for the purpose. Much skill and capital have been expended in this species of draining in this country. The benefits are, that few *springs* are now to be seen on cultivated land, and it is likely those benefits will be permanent. What flows into rivers is ready to be evaporated again into the atmosphere from the ocean, and returned to the earth in rain; but that which is retained under the soil on impervious layers of earth remains to effect incalculable mischief. While hidden water remains, manure, whether putrescent or caustic, can impart no fertility to the soil; the plough, the harrow, and even the roller, cannot pulverize it into a fine mould; the grass can contain no nutriment for live stock, as the finer sorts disappear, and their places are usurped by coarse aquatic plants; the stock can never receive a hearty meal of grass or straw from land in such a state; they are always hungry and dissatisfied, and of course remain in low condition; the trees acquire a hard bark, stiffened branches, and soon become the prey of numerous parasites; the roads in the neighbourhood are constantly soft and rutted; the ditches and furrows are either plashy or like a sponge full of water,—suitable receptacles for the new, and the frog; the circumambient air is always damp and chilly, and from early autumn to late in spring the raw hoar-frosts meets the face like a wet cloth morning and evening; in winter the

frosts incrusts every furrow and plant with ice, not strong enough to bear one's weight, but just weak enough to give way to every step, while the snow lies lurking in crevices behind the sun till late in spring,—fit feeding ground of the woodcock and snipe; and in summer mosquitoes, green flies, midges, gnats, and gadflies torment the cattle, the labourer and his horses from morning to night, whilst the sheep get scalded heads and eaten up by maggots during the hot blinks of sunshine. Would that this were an exaggerated picture! It may be seen in part, if not in whole, in every parish in Scotland. Look in the mountainous region of the Highlands, into the extensive sheep walks of the Lowlands, into the Lammermuirs, Pentlands, Ochils, Campsies, and Sidlaws, nay, into the cultivated plains of every county, and part of this picture will somewhere present itself to the view. Look into every one of the counties of Scotland, and see the many thousands of acres which require draining on every hand, and which are lying in the *dead throw* for want of it. Even in the choicest spots—for the richest portions are but spots in size in this favoured land—favoured by Providence in the industry, skill, and prudence of its inhabitants—draining would act as a charm. The Carse of Gowrie is flooded with surface water in winter, and so is Berwickshire; and in East Lothian which contains a great proportion of naturally dry and rich soils, the stronger land will scarcely grow red clover for want of draining. The lands lying on both sides of all the roads leading from Edinburgh to Glasgow, to Ayr, to Dumfries, to Kelso, to Perth require extensive draining. In a word we repeat, that the eye cannot be turned round in any direction without falling upon land that would be greatly improved in fertility by effectual draining. This sweeping accusation could be easily substantiated by many particular references; and its vindication rests on the incalculable loss which agriculturists incur by neglecting thorough draining.

After reflecting on these statements, it will be acknowledged that draining has not been prosecuted in this country even to the extent which it might be, and far less to the extent that would amply repay its cost. The cost would no doubt be considerable; but if it were executed in a substantial manner, we maintain that the increase to the first crop would repay the whole expense to the farmer, be that what it may. But the tenant ought not in justice to bear the whole expense of such a fundamental improvement of the land. The landlord should at least share alike with him, and lessen the burden to each.

The kind of draining which would be most effectual, is not difficult to choose. The greatest obstacle to fertility, is the stagnant water spread extensively upon a retentive subsoil; and the only kind of draining which is efficacious for its removal, is not the very deep and distantly placed drains, which are admirably suited to the removal of springs or *spouts*, as they are called, whether superficial or deeply hidden, but the more shallow drain frequently repeated, for *deep drains at considerable distances cannot draw water at those distances from impervious subsoils*. The depth and the distances between the drains, depend entirely on the imperviousness of the subsoil. But it is easy to fix the *minimum* depth. No kind of drain, on any pretext, ought to have a *smaller depth of stones than eighteen inches* nor a *smaller depth of earth above them than one foot*, so that *no drain should be less than thirty inches in depth*, nor need the *maximum* of

shallow drains exceed *three feet*. The width should allow a man to work freely in them. The distance between the drains has been fixed at the breadth of a ridge, that is in every furrow. Where broad ridges are used in clay land, such as in the Carse of Gowrie, the distance is often too great to do much good. Where it does not exceed fifteen or eighteen feet, according to the tenacity of the subsoil, the distances may be considered proper. Much has been urged in favour of making the drains, up and down the declivity. We confess we see no particular charm in the perpendicular position, on the contrary, we see many objections to it. We hold it to be a maxim in draining, that rapid descents of water in drains is incompatible with the maintenance of good workmanship. Water descending rapidly any where gutters the ground, and so it will in any drain. Besides, the perpendicular position is not the most favourable for intercepting the water in its descent; because it is very rare that a declivity presents only one declination, it is almost always attended with two, one up and down, and another from side to side in the horizontal direction. Down such a declivity the water will take a diagonal direction, guided by the degree of the lateral declination. Now, it is as obvious as any demonstration in dynamics, that drains placed in parallel lines declining down the face of a declivity, having a twofold declination, that is diagonally, will afford a much more easy passage for a current of water, than any other direction. The more easy the egress of the water, the more gently will it run away, and the more effectually will it dry the land. The only reason for placing drains up and down is, that the furrows are so placed; but it would be better to make the ridge run diagonally, than allow water to run quickly in a drain in a perpendicular direction. Small round stones, or broken stones, should in every case be preferred to tiles, and they should be carefully placed by the hand. It is only where stones cannot be obtained, but at great labour and expense that tiles should be used. Many tiles which we have seen in this country are not trust-worthy. They are either too much or too little burnt. We have seen a night's frost break the whole tiles laid down for a drain. Luckily they were broken before they were used; but why are such spongy tiles sold to deceive the public? There is no doubt that many drains have already been formed with such tiles, for the disposal of which, the tile-maker ought to be amerced in heavy damages. Good tiles will last for ages. Tiles have been taken up in Lincolnshire whose age is unknown. Tiles should never be laid in clay land without soles, for in time they will assuredly sink into it. Stones should, if possible to be obtained, be always placed above tiles to retain them in their places, and the remainder of the drain filled with stones, dried peats, gravel, or such like porous substance, especially in clay land, otherwise the clay will bind over the tiles in a few years.

This species of draining possesses the advantage of being applicable to every kind of soil; and it will certainly relieve any soil which is afflicted with stagnant surface water. If generally practised, it would effectually drain the whole country, and remove the chief obstacle that exists to perfect fertility of the soil. Were the soil thus fertilised the produce of the country, whether in corn, straw, green crops, or pasturage, would be increased manifold. Wheat and live-stock would then be so abundant, and of course cheap, that every labourer would be enabled to consume wheaten-

bread and butcher-meat; and constant employment be provided for agricultural labourers for many years. Nor is such a national scheme of improvement chimerical. Many proprietors possess the means, many farmers have yet the means of accomplishing to in their estates and farms, and those who have not, should be assisted by the state. Much public money it is feared, is thrown away on doubtful expedients, and much applied to pernicious purposes, which if employed in draining the land, would increase its resources beyond credibility. One sheep additional kept, or one quarter of corn more raised, on an acre would add millions a year to the wealth of the country.

### ADDRESS TO THE LANDOWNERS OF ENGLAND ON AGRICULTURAL DISTRESS AND ITS REMEDY.

MY LORDS AND GENTLEMEN,—The period has now arrived when apathy is absolute wickedness, and when neglect of the duty you owe to your countrymen is at once both hazardous and dangerous. The fact can no longer be concealed from you or from me, that a crisis is at hand; your interest—nay, your very existence as men of property and standing, is at stake; you are hemmed in on all sides, the rich and overgrown manufacturer on the one part, and the impoverished farmer on the other; and, in fine, all England has its eyes upon you, to see what line of conduct you will adopt in this emergency.

The farmers, who have been the stay and safeguard of this nation; whose loyalty has been proverbial, and whose adherence to the religion, laws, and customs of their country have in evil times rendered them the scoff of every traitor; who have supported you at all times to a man, when they knew well, often, that all you aimed at was political ambition; who have, when called upon, filled the ranks of your yeomanry troops for the protection of the country, and this at much expense, and without a murmur; in fact, who have stood by you constantly, upheld you against all sedition and rebellion, and were ever your best, warmest, and most devoted friends,—these men, I now tell you, if you do not already know it well, are on the point of individual bankruptcy and universal ruin.

Year after year the crisis has been approaching them nearer and nearer; the prospect, instead of brightening, is gloomier than ever; they have been *hoping against hope*; they have beheld their neighbours, one by one, sinking into despair and beggary, and have felt ruin at their gates and their very hearths; their capital has sunk to nothing; their comforts have become lessened; their labour, their toil, their anxiety, their studied and niggardly economy, has availed them nothing;—yet still they have continued their trust in *you*, their hereditary protectors; they have relied on *you* to the latest moment, and have ever carefully abstained from all illegal and improper combinations, and from all acts of outrage and violence.

Yet with what good reason might they rise up to a man against *you*, the landowners of England, and accuse you, openly and before God, for all their miseries and misfortunes?

They know well that for centuries you and your ancestors have had the privilege (which they do not call in question) of retaining and possessing the soil, and they think you owe them, at least, gratitude for their care in tilling it under you. They know, moreover, that for centuries you have had almost irre-

sponsible legislative power—at least, have been but little opposed—in all your political measures; and seeing therefore that, notwithstanding this, you have been unable to protect them and yourselves, they are now wishful for you to try some *new plan*, independent of legislature, and which shall come at once, and in a direct manner, from *your* pockets into *theirs*!

Seeing, also, that the manufacturing interest has arisen, prospered, flourished, and obtained power, without your assistance at all—nay, almost in direct opposition to your wishes; and that our great merchants have become as princes of the earth, with but little of your aid, and chiefly by their own worth and enterprise, they are ready to accuse you (knowing they are themselves not inferior in industry or honesty either to the manufacturer or the merchant) at once of wilful blindness, or, what is equally hurtful, of wilful ignorance, in managing and conducting their affairs.

If they had been a rash, unthinking, extravagant, and speculative class of men, they might in this case have gained conviction by experience, and have been led to reproach *themselves* for their present degradation and misfortune. But the fact is, my lords and gentlemen, that there is no tenantry in the world more exemplary than that over which you have the honour to possess power. They are a class of people who are to the utmost degree careful and economical in all their expenditure; they can accuse themselves of no extravagance in their domestic arrangements; their houses are frugally and humbly furnished; they labour themselves, and their wives, their sons, and their daughters are likewise made serviceable in all farming or household labours; they never give rich banquets, nor attend theatres, nor ride about in chariots, with rich liveries, like their upstart neighbours, the manufacturers. Nay, on the other hand, they are miserably poor—they have lost all heart and spirit; in spite of all their efforts, and their desire *merely* to live, they are unable any longer to maintain their ground, and are yearly in dread of a workhouse or a prison.

This, gentlemen, is no exaggerated statement; *it is the truth, and nothing but the truth*. I call upon you, then, to inform the British nation, from your places in the House of Peers or Commons, how it is that the farmers, an integral interest of this realm, are thus rapidly retrograding to the position of the mere *husbandman*; whilst the manufacturer is wallowing in wealth, and revelling in the greatest abundance!

Each year the King's speech (which is, in truth, the Minister's speech), congratulates the country on the manufacturer, and laments the poverty of the agriculturist. Whig, Whig-Radical—Tory, or Ultra-Tory Administration, it is all the same in this respect. Yet, year after year, the evil remains without a remedy. You gain your seats in the House of Commons by the sole efforts of the farmer, and yet, with an insolent effrontery (which in this day will no longer answer), you wade through the session in defiance of him; offer him no apology for blighting his hopes and thwarting his desires; institute no inquiry into the cause of his distresses, even though every other minor subject is eagerly canvassed, and innumerable expensive commissions are allowed, for no earthly purpose whatever, save of impoverishing the nation; and what is worst of all, you openly mock at his entreaties, and insult his poverty with contumely and scorn.

Suffer me then to instruct you, as briefly as my present letter will allow, on the present possible means, of *immediately* improving the condition of the farmer. I will not attempt to beat about the bush,

but will endeavour to strike home to you at once. I will canvass no merely political gew-gaw, which you get up for election purposes solely, but will inform you, if you will listen with patience, of some useful but unwelcome and unpalatable truths, which it will do you good to hear and attend to. At the same time, allow me to premise, that I for one have no interest whatsoever in the present discussion: I never received one farthing of profit from any one of you, nor from the farmer either. What I do now is faithfully and humbly in the love and service of my countrymen.

I may premise then, generally, that one of the chief and pressing causes of the farmers' present distress, originates in the extremely low and unremunerating price of corn. The production is clearly too great for the consumption. This may arise partly from the circumstance, that during the high war-prices, great quantities of the old primitive grasses, *i. e.* the old pastures, were hastily ploughed up, in order to allow the farmer the highest scale of profits. Wheat was the order of the day, and every thing was sacrificed to its growth. The consequence is, that *now*, when corn is too abundant and therefore low in price, and when grass land would be far more profitable, the farmer feels unable to remedy himself, for he does not possess the capital, and therefore cannot afford the number of years, necessary to allow his lands this necessary change of produce.

Great quantities of land were also then enclosed; and in addition to this, the increased skill of the farmer has enabled it to produce an infinitely greater abundance than formerly. Yet when we consider the increased number of manufacturing operatives in large towns—their increased wages—and consequently their increased demand for the necessaries of life, this ought to be no argument; but it is to be feared (though Poulett Thompson refused the inquiry) that an immense quantity of corn is yearly imported into this country from Guernsey, Jersey, the Isle of Man, and other places.

Be it remembered also, that the English farmer has but a very small chance of contending with the *Irish* and the *Scotch* farmer in the market.

In these other countries labour is extremely cheap, and taxes of the various kinds that press on land much smaller. A Scottish labourer but seldom sits down to flesh meat; his chief food is milk and oatmeal; he uses but little of beef, bacon, cheese, ale, tea, cakes, and other little luxuries, which the poor of England think necessary; poor rates, moreover, are next to nothing (and then do not fall in a direct way), highway rates are small; and, altogether, his yearly expenses (I mean such as are of a *necessary* kind), are but one-half those of the English farmer. The same argument applies to the Irish farmer. Thus it is that he can afford to sell infinitely cheaper than we can, and is better remunerated by small prices, or at least is better able to bear a cheap market, than the English farmer.

The poor laws in England, again, under which Scotland and Ireland do not suffer, were here introduced by Queen Elizabeth, for the protection of the sick, the aged, the idiot, the blind, and deformed, but have in latter years been perverted to the most nefarious and disgraceful purposes.

The improvement of roads in England has also entailed a greater highway rate.—Again, the diffusion of luxury—among all classes—force the farmer, do as he will, into an increase of his expenditure.

Take the question then as you will, the farmer's burthen is every way increased—his power of meeting the landlord, at present prices, is every way dimin-

ished—and year by year his prospects, instead of improving, become darker and more alarming.

One fact must ever be borne in mind. *Fifty years ago*—(before the French war, and all those other lug-bears, which the speculative writers and the House of Commons' theorists conjure up to mystify and perplex us) corn was selling at a *higher price* than *now*—for then it was in the market at above 40s.

Yet at the present moment our national debt has got an increase of 1,000,000,—our rates of different descriptions are *trebled*,—and the rent of land is at least *double*. Can it be wondered then that the farmer is starving, and his prospects in ruin? Let this state of things go on, and England must sink into the dust before other nations—her farmers will become common labourers under certain great masters—the infamous vassalage and villainage system will be renewed—the villages will all sink into decay, and only two orders will exist in this once happy country, *the very rich, and the very poor*. But, my lords and gentlemen, this state of things shall never be, if England is but true to herself, and the farmers select for themselves proper champions. You must remember, the truth must fall upon you in your privacies, that intellect and civilization are rapidly progressing; that the mists are falling from the eyes of the ignorant all over the world, and that man is now awakening to a consciousness of his own individual dignity and majesty. Can you trample him into the dust then, and he not rebel against it? *Mere* politicians, whether of one set or the other of the aristocracy, may blind us for a season; may amuse us at an election; may delude us with fictitious hopes; but believe me, the day is coming when truth and justice are to be scrutinized, and when your conduct to the poor farmer will be eagerly looked into.

You may hoodwink the farmer, by long and tedious discussions which amount to nothing—you may make long speeches and hard divisions on a malt tax, which, after all, is but a *local* good, and, at any rate more beneficial to the landlord than the tenant—with long poor law inquiries, which are all false and futile save in their glaring cruelty and injustice—with long arguments about the salvation which must accrue to the farmer, from a silver currency, which is but the crotchet of one man—and you may *talk*, (why not *act*?) loudly about the benefit which must result from an agricultural inquiry, and also institute agricultural associations which also are more for the landlord's benefit than for the farmer's; but, after all this delusion is past, the truth *must* come out—aye, and it will be sounded in your ears as with a voice of thunder—“EVERY LANDLORD IN ENGLAND MUST REDUCE HIS RENTS!” “That is the question!” That is the farmer's panacea—his salvation from ruin, and the only boon which the landlord can offer him. This it is which will at once relieve his wants—afford him that capital of which he has been plundered—allow him to pay his rents and taxes with greater ease—give him equality of comfort and wealth with the tradesman—and make the farmer, as hitherto, the boast and pride of this great country.

Your election promises are as nothing—words are at all times easy offerings—but it is by your deeds, as I before hinted, that the electors must judge of you. In fine, if they will take the advice of a well-wisher, they will only vote at the next election for that man who promises in the first place to reduce his rents, and afterwards to exert himself in the House of Commons for a commission to enquire and examine into the lands of Great Britain, towards a just and equitable rental being established.

Again, it is not by returning a 5 per cent. or a 10 per cent. discount on your land, that good can be done, which you can withdraw as you please, either from pique or avarice, and which at the best is but a crumb to a hungry man;—no, it is by meeting the farmer half way, and joining with him in an honest manner, in the losses arising from depreciation of produce. This is but justice, and what the farmer has a right to demand. But you will ask, how is this great sacrifice to be borne?

I answer at once, *by reducing your expenses*; by moderating those terrific extravagances and consuming luxuries, which a London residence, and London prodigality, with all your continental abominations entail upon you; by reducing the superabundance of our overgrown establishments, your servants, your horses, and your chariots; by ceasing to vie with one another in the madness of your pleasures and debaucheries; by limiting altogether your rich wines and gorgeous entertainments, your blandishments of theatres, operas, hells, clubs, race courses, and all those other monstrous luxuries, to which your incomes give you no right—and which, be it ever distinctly borne in mind, are wrung from the sweating forehead and agonizing privations of your impoverished tenants.

If you will not do this, the work of beggary and destitution must continue. I trust, however, that wisdom and truth will influence you; or if you refuse, in conclusion, I warn you, that every market town in England shall have a FARMERS' UNION. They must all link together under one central head, they must be organized and united together, (and when did oppression *not* produce union?)—they must all to a man give up their farms, and throw themselves on their country—and they must heard injustice in his den! Such things I fervently hope may never be; *you* can hinder it.

Finally, my lords and gentlemen, ponder well on these things, and believe me your firm friend and faithful servant,  
PHILO-AGRICOLA.

Guisbrough, Yorkshire, Nov. 16, 1835.

### COPY OF A LETTER ADDRESSED TO THE CHAIRMAN OF THE CAM- BRIDGESHIRE FARMERS' ASSO- CIATION, AND OF HIS REPLY.

Kirby Hall, Boroughbridge, Oct. 17.

Sir,—As a member of the Boroughbridge Agricultural Association, I take the liberty of addressing you, and hope that, though an utter stranger, you will consider me justified by the importance of my subject.

The society to which I belong has, in common with all others in this part of the country, had its attention forcibly drawn to the great and increasing depression under which the agricultural interest is at present labouring; and as the first step towards the removal of any evil is to ascertain with certainty its cause, a resolution was passed at our last quarterly meeting, requesting members of the society to procure all the information possible on the subject; such information to be communicated and discussed at our next meeting (Jan. 1836.) With this end in view, I have addressed myself to you, as presiding over the society which has the reputation of being the most extensive and active of all that have been established of similar description throughout Great Britain, and shall feel greatly obliged by an answer to the following queries:—

1st. What are the causes of the present ruinously low prices of agricultural produce?

2nd. What measures hold out the greatest probability of permanent relief to the agriculturist?

I assume that the distress which is pressing so heavily on the northern, cannot be unknown to the midland counties, and that the attention of the Cambridgeshire Association has been specially directed to matters so vitally affecting the interests of all proprietors and occupiers of land. If this should not be the case, or if you should consider the communication of a stranger as undeserving of reply, I shall be sorry to have given you the trouble of reading the above from, Sir, your very obedient servant,

H. S. THOMPSON.

To the Chairman of the Cambridge-  
shire Agricultural Association.

Duxford, Cambridgeshire, Oct. 30.

Sir,—I feel much flattered by the compliment which, through me, you are pleased to pay to the Agricultural Association over which I preside; and it gives me great pleasure to find that our exertions here to produce amongst our brother farmers throughout the country an acquaintance with the cause of our common distress, are not likely to be altogether unavailing.

It would be needless to enter into the various matters which have led us to believe that we cannot with justice attribute our present deplorable situation to high rents, to over production, to superabundant population, or, indeed, to any other of the theories of modern political economists; they may, indeed, in some places and upon some occasions, have assisted to promote it—we are free to admit that they have undoubtedly done so—but they are not the evil, nor can we look to any alteration in circumstances affecting *them* for its *efficient* remedy.

To proceed, however, to answer your questions in the order in which they are proposed in your letter. You ask, first, "What are the causes of the present ruinously low prices of agricultural produce?"

This question, we contend, will admit of but one answer—that answer we assert to be as obvious as cause and effect can possibly be. I will endeavour to condense it in a few words: we say then, that any abstraction from the circulating medium of a country, in other words, any contraction of its currency,\* must compel a reduction in the value of whatever is the produce of labour in that country, by a sum equal to the amount of that abstraction: thus, if there be fifty thousand quarters of wheat in the market to sell, where there are two hundred thousand pounds to purchase them with, wheat will necessarily be worth twice what it would fetch if there were only half two hundred thousand pounds in the pockets of the buyers, wheat being a perishable commodity, of daily consumption, and one which must be sold; and therefore we argue that, as it is capable of proof that the existing circulating medium of this

\* The wisecracks who have bored us to death about the "wholesome state of the currency" are beginning to be ashamed of the intolerable nonsense of such clap-trap fustian. Why, the whole gold in circulation does not amount to an *eighth part of one year's taxes!* If they really meant us to have a metallic currency, why did they not at once apply the sponge? They were guilty of just as great an act of dishonesty in arbitrarily reducing the value of the fee-simple of every man's estate one-third, and we might then not only have had the wholesome currency they talk about in good earnest, but a free-trade too, possibly without mischief.

country is less by one hundred millions\* than it was in 1818, the whole of that sum is taken from the value of the produce of British industry: hence, not the low price of wheat only and of every thing else, the product of labour, and of labour itself, but hence also the other obvious and mischievous result—the enormous increase of the national debt and of the taxes; because, though the figures representing the amount of them may remain the same, it takes double the quantity of corn, &c., to pay them with that it required twenty years ago.

With regard to your second question—"What measures hold out the greatest probability of permanent relief to the agriculturist?" Knowing the disease, we almost necessarily know the cure:—we believe that nothing can produce permanence in prices, or give us remunerating ones, but a circulating medium much more extended than the present, to be regulated in its amount by the amount of the national debt, and to be kept as nearly as possible at a stated sum; such extension to be produced either by legalizing every where the tender of the Bank of England note and the re-issue of small notes by the country bankers as well as by the Bank of England, or by re-coining the metallic currency, so that a sovereign of the value of twenty shillings should at most be not more than two-thirds of the size of the present one: there would, perhaps, be this additional advantage attending the adoption of the latter expedient, it would have a tendency to bring English absentees (of whom there are a great many thousands) home again; millions of money annually sent abroad would, probably, be spent in this country, and, nationally considered, nobody would be damaged by the change but the mere money-owner, whose business it is to reduce the price of every thing to the lowest farthing, and who is now fattening upon what he has already accomplished in this way, to the ruin and starvation of every body else.

This is the remedy; but as useful and powerful auxiliaries of a measure of this kind, *protection* must be granted to British industry; so long as we have a national debt, which, by the way, will not be very long-lived if we continue to go on as we do, the means must be granted to the people of paying it. Our manufactures therefore, our shipping interests, and, in short, all the industrious and producing classes of the country, whatever be their denomination, and of course including the farmer, must be effectually protected from unfair foreign competition by adequate duties, or if need be by total prohibition. The immediate consequence of adopting measures of this nature would be good prices, good profits, and good wages; the great thing for us to consider is how to accomplish objects so desirable to the whole nation; to us no better plan suggests itself than that of uniting all the farmer's societies throughout the empire, and showing ourselves in such force that the Legislature—whoever may happen to be at the head of the Government—may be compelled to entertain the subject, and to do us that indispensable and obvious justice which the smallest portion of common sense should have long ago dictated; for ourselves we have resolved to

support no candidates to represent us in Parliament who are known to entertain views of an opposite kind, and if all the societies in the country were to act upon similar principles, we should not see motions like those of the Marquis of Chandos and Mr. Cayley, in the last Session, treated so unceremoniously as they were.

I am happy to say that since I received your letter two others have reached me—one from East Suffolk, and the other from Buckinghamshire—requesting deputations from the society of this county to attend meetings at Framlingham on the 3rd, and Aylesbury on the 12th, and it is my intention to be present, if possible, at both.

I would have given your letter an earlier answer, but I thought it right before doing so to submit it to the Committee of our society.—I have the honour to be, sir, your obedient servant,

WM. THURNALL.

To H. S. Thompson, Esq.,  
Kirby Hall, Boroughbridge.

### EARLY ŒSTRUM, AND IMPREGNATION IN A HEIFER.

By Mr. W. A. CARTWRIGHT, *Whitchurch.*

(From the *Veterinarian.*)

In my last letter to you I said that Mr. Wilson informed me that a Mr. Robert Grindley, of Penley, had had a heifer that calved when she was about fifteen months old, and that she died in calving. I have this day seen Mr. Grindley, who says that this heifer of his was of the pure Durham breed, and could not be more than *twelve months* old when she calved.

When hulled she must have been feeding at the pail, and impregnated by a bull of his neighbour's (Mr. Griffiths) that had broken out of his pasture, and was at least nine score weight a quarter. He also says that the heifer *did not die in calving*, but that the calf was a very large one, and ably extracted, with great difficulty, by Mr. Hampson, veterinary surgeon, Ellesmere, who was some hours in cutting it away. She is now doing very well and in calf again, and Mr. G. believes she will not be above two years old ere she next calves.

A Mr. Knight, who resided some years ago in this town, had a heifer that brought a calf when she was fourteen or fifteen months old.

Being at D. Poole's, Esq., of Marbury Hall, the other day, I was mentioning these circumstances to the cowman there, who said that they had, two or three years ago, a Maux calf, not above three or four months old, that was frequently shewing a desire for the bull, and which was during the winter time. She was not allowed any intercourse with the bull until she was older, when she conceived.

I am, from the facts mentioned in this and my last letter, inclined to think that the circumstance of calves seeking the bull, and becoming impregnated at so early a period, is not so rare a fact as we might be led to imagine, and have little doubt but many similar cases will be sent for your insertion.

In the manufacture of English cheese rennet is commonly employed to coagulate the caseous matter; but in the manufacture of Dutch cheese muriatic acid is employed, to which, it is said, its pungency and freedom from mites are to be inferred.

## RUTLAND AGRICULTURAL CHRISTMAS SHOW.

The Annual Christmas Show of this truly useful Agricultural Society was exhibited in the Riding House at Oakham, on Tuesday, Dec. 1, and never since its establishment has it produced one on an equality with the present. The animals shown were of the very first description, comprising oxen, steers, cows, heifers, sheep, and pigs. The number of visitors exceeded that of any former year,—the receipts for admission at sixpence each amounting to 33l 10s 6d. The prize beast of the first class (to Stafford O'Brien, Esq.) was surrounded during the whole of the day by a host of competent judges, who expressed the greatest admiration of the proportions of the animal,—nor was the second prize (to the Marquis of Exeter) without its admirers; indeed, all declared that they never witnessed a better exhibition of cattle, nor so many that really deserved premiums. About three o'clock, the members and friends of the society retired to a sumptuous

### DINNER.

prepared by Mr. H. Stimson, at the Crown Inn.

Sir Gerard Noel, Bart., the president of the society, officiated as chairman, and Stafford O'Brien as vice; and amongst the company present we noticed G. J. Heathcote, Esq., M. P., H. Handley, Esq., M. P., Hon. Col. Lowther, M. P., E. W. Wilmot, Esq., Henry Dawson, Esq., Henry Wilson, Esq., R. W. Baker, Esq., J. E. Jones, Esq.,—Bevan, Esq., Augustus O'Brien, Esq., J. Wetheral, Esq., &c. &c.

After the usual loyal toasts had been drank, Mr. Smith, of Burley, the Secretary, was called upon to read the award of the Judges (Mr. Stokes, of Kingston, Warwickshire, Mr. Bennett, of Bickerings Park, Bedfordshire, and Mr. Farrow, of Loughborough, Leicestershire,) which was as follows:—

**CLASS I.**—To the feeder of the best Oxen or Steer of any breed or weight, under five years of age, without restriction as to feeding.

The first premiums of 15 sovs. to Stafford O'Brien, Esq., of Blatherwycke Park, near Wansford, a 4 years and 6 months old Hereford Ox, bred by himself, and fed by him on oil-cake, beam-cake, turnips, carrots, and hay.

The second premium of 7 sovs. to Lord Exeter, of Burghley, near Stamford, a under 3 years and six months old Durham Steer, bred by his Lordship from Archibald, dam by Emperor, and fed by him on oil-cake, bean and barley flour, carrots, Swedish turnips, and hay.

The other competitors in this class were R. W. Baker, Esq., of Cottesmore, near Oakham; and Mr. John Smith, of Heckington, near Sleaford.

**CLASS II.**—To the feeder of the best Oxen or Steer of any breed or weight, under five years of age, that shall not have had, from the 1st of February, 1835, to the 1st of August, oil, oil-cake, corn, pulse, seeds, or meal of these.

The first premium of 10 sovs. to R. W. Baker, Esq., of Cottesmore, near Oakham, a 4 years and 2 months old Durham Ox, bred by himself, and fed by him on grass, hay, turnips, carrots, oil-cake, and bean-flour.

The second premium of 5 sovs. to Mr. S. Cheetham, of Hambleton, near Oakham, a 3 years and 10 months old Durham Steer, bred by Mr. J. Wilkinson, of Lenton, near Nottingham, and fed by him on hay, clover, tares, and vegetables only, previous to the 1st of August, and subsequently oil-cake and bean-meal.

The other competitors in this class were Mr. Hotchkiss, of Edenham, near Bourne; and Mr. C. Smith, of Burley, near Oakham.

**CLASS III.**—To the feeder of the best Oxen or Steer of any breed or age, under 90 stone, that shall not have had, from the 1st of February, 1835, to the time of showing, oil, oil-cake, corn, seeds, or pulse of these.

The first premium of 7 sovs. to Mr. C. Smith, of Burley, near Oakham, a 3 years and 10 months old Hereford Steer, fed by him on hay and carrots.

The second premium of 3 sovs. to Mr. Hotchkiss, of Edenham, a 3 years and 10 months old Twin Steer bred by himself from a bull of his own, and fed by him on vegetables only.

The other competitors in this class were R. W. Baker, Esq., of Cottesmore; Mr. R. Healey, of Loughton, near Falkingham; Sir John Palmer, Bart., Carlton, near Rockingham; and Mr. John Fryer, of Hambleton, near Oakham.

**CLASS IV.**—To the feeder of the best Oxen or Steers of any breed or weight, under five years of age, that shall not have had, from the 1st of February, 1835, to the time of showing, oil, oil-cake, corn, pulse, or meal of these.

The first premium of 10 sovs. to Mr. H. J. Rudkin, of Langham Lodge, near Oakham, a 3 years and 11 months old Steer, bred by Mr. John Almond, of Langham, and fed by him on grass and vegetables only.

The second premium of 5 sovs. to R. W. Baker, Esq., of Cottesmore, a 4 years old Ox, bred by the Earl of Lonsdale, from Mr. Baker's bull Gainsborough, and fed by him on grass only till 19th of October, since then upon carrots, turnips, hay, and clover.

The other competitors in this class were Mr. Hotchkiss, of Edenham; Sir J. Palmer, Bart., of Carlton, and Mrs. Eaton, of Ketton, near Stamford.

**CLASS V.**—To the feeder of the best Cows or Heifers of any breed or weight, under five years of age, without restriction as to feeding.

The first premium of 7 sovs. to R. W. Baker, Esq., of Cottesmore, a 4 years and 10 months old Durham Heifer, bred by himself, and fed by him on grass, hay, turnips, carrots, oil-cake, and bean-meal.

The second premium of 3 sovs. to Sir J. Palmer, Bart., of Carlton, a 4 years and 8 months old Heifer, bred by himself, and fed by him on grass and turnips only.

The other competitor in this class was Mr. H. J. Rudkin, of Langham Lodge.

**CLASS VI.**—To the feeder of the best fat Dairy Cow, above five years of age, that has calved twice at least at their full time, without restrictions as to feeding.

The first premium of 7 sovs. to Mr. Needham, of Water Newton, near Warsford, a 7 years and 9 months old Cow, bred by himself from a bull of his own breeding, and fed by him on oil-cake, grass, turnips, cabbages, and clover.

The second premium of 3 sovs. to Mr. Hotchkiss, of Edenham, a 10 years old Cow, bred by himself from a bull of his own, and fed by him on about 4 cwt. of oil-cake and Swedish turnips, since the 1st of August.

The other competitor in this class was Mr. John Coverley, of Castle Byham.

**CLASS VII.**—To the feeder of the best long-woolled fat Wether Sheep, one year old, without restriction as to feeding.

The first premium of 7 sovs. to Mr. Wm. Pawlett, of Barnack, for 3 under 20 months old Leicester Wethers, bred by himself, from rams hired of Mr. Pawlett, of Tinwell, and fed by him on vegetable food only, viz. clover, turnips, cole, cabbages, and carrots.

The second premium of 3 sovs. to Mr. H. Stimson, of Oakham, for 3 under 23 months old Leicester Wethers, bred by himself, and fed by him on turnips, cabbages, 2 stone of oil-cake, and one bushel of beans.

The other competitors in this class were Lord Exeter, of Burghley (highly commended); E. W. Wilmot, Esq., of Pickwell; and Mr. C. Bowman, of Greatford.

**CLASS VIII.**—To the feeder of the best long-woolled fat Wether Sheep, one year old, bred within the limits of this Society, that have not at any time eaten oil, oil-cake, seeds, corn, pulse, or meal of these.

The first premium of 5 sovs. to Mr. Wm. Pawlett, of Barnack, for 3 under 20 months old Leicester Wethers, bred by himself, from rams hired of Mr. Pawlett, of Tinwell, and fed by him on vegetable food only.

The second premium of 3 sovs. to Mr. R. Smith, of Burley, for 3 under 20 months old Leicester Wethers, bred by himself, from rams hired of Mr. R. Garratt, and fed by him on clover, cole, and carrots.

The other competitor in this class was E. W. Wilmot, Esq., of Pickwell.

**CLASS IX.**—To the feeder of the best long-woolled fat Wether Sheep, two years old, fed within the limits of this Society, that have not at any time eaten oil, oil-cake, seeds, corn, pulse, or meal of these.

The first premium of 7 sovs. to Mr. Painter, of Burley, for 3 under 31 months old Leicester Wethers, bred by himself, from rams hired of Richard Cresswell, Esq., and fed by him on grass and vegetable food only.

The second premium of 3 sovs. to Mr. Burgess, of Ridlington Park, for 3 under 31 months old Leicester Wethers, bred by himself, and fed by him on vegetable food only.

The other competitor in this class was Mr. Bradshaw, of Burley (commended).

**CLASS X.**—To the exhibitor of the best pen of five breeding Ewes that have suckled lambs up to the 1st of July, 1835, and that have been fed on grass and seeds only for six months previous to the time of showing.

The first premium of 5 sovs. to Hon. Colonel Lowther, M. P., of Cottesmore, for five Leicester Ewes, bred by himself, and fed by him on grass only, at his Barleythorpe estate.

The second premium of 3 sovs. to E. W. Wilmot, Esq., of Pickwell, for five Leicester Ewes, bred by himself, and fed by him on grass only, and suckled their lambs until the 20th July, 1835.

The other competitors in this class were W. Sherrard, Esq., of Langham; Mr. R. Smith, of Burley (commended); and Mr. Hayes, of Wisenside.

**CLASS XI.**—To the feeder of the best fat Pig of any breed or age, weight under 20 stone.

The first premium of 5 sovs. to Mr. T. Chapman, of Whitwell, a 31 weeks old Pig, bred by himself, and fed by him on wheat flour, and a little barley-meal.

The second premium of 2 sovs. to Mr. W. Stimson, of Oakham, a 42 weeks old Pig, bred by himself, and fed by him on barley-meal.

**CLASS XII.**—To the feeder of the best fat Pig of any breed or age, weight under 20 stone, bred within the limits of this Society.

The first premium of 3 sovs. to Mr. J. Stimson, of Oakham, for a 52 weeks old Pig, bred by the Rev. H. Finch, and fed by him on meal, &c.

The second premium of 2 sovs. to E. W. Wilmot, Esq., of Pickwell, for a 14 months old Pig, bred by himself, and fed by him in the straw-yard with the other store pigs; had neither milk, corn, or flour, until Nov. 1st, 1835; since then it has been fed on barley-meal.

The other competitors in this class were Mr. Hayes, of Whissendine; and Mr. T. Lester, of Manton.

**CLASS XIII.**—To the owner of the best Cart Stallion from any county, that will attend at Oakham once a week during the season of 1836, and covers many mares as may be offered to him, (not beyond a reasonable number, and at a reasonable price).

A premium of 10 sovs. to Mr. D. Housin, of Muscom, for an 11 years old brown Cart Stallion.

Mr. Billing's, (of Histon,) 9 years old Cart Stallion allowed to be the second and succeeding horse, in case Mr. Housin neglects the restrictions of the society.

The other competitors in this class were Mr. J. Berridge of Ingersby; R. W. Baker, Esq., of Cottesmore; Mr. Hefelkin, of Edenham; Mr. Stapleton, of West Deeping; Mr. Goodwin, of Ayston; and Mr. King, of Seaton.

*Offered by E. W. Wilmot, Esq., of Pickwell.*

To the Labourer in Hu-bandy who has brought up the greatest number of children without parochial relief, and can produce the best character for his employer.

The first premium of 3 sovs. to Thomas Barfield, of South Luffenham, who has worked upon the farm (now in the occupation of Mr. W. Springthorpe) for 59 years, has brought up a family of nine children, is now in his 71st year, and has never received any parochial relief.

The second premium of 2 sovs. to John Faulks, of Langham, labourer, who has brought up five children, with a sick wife, without parochial relief; has worked upwards of 40 years upon the farm now in the occupation of W. Sherrard, Esq., of Langham, and still continues to do so.

The third premium of 1 sov. to W. Chamberlain, of Burley, labourer, who has lived and worked upon the Burley Park Farm, near Oakham, for 39 years, is 51 years old, has brought up eight children, and has never at any time received parochial relief, and still bears an excellent character.

The following competitors were highly commended by the Stewards:—Thos. Henfries, of Eagleton; John Freeman, of Ketton; and Zachariah Wright, of Cottesmore.

*Offered by Mr. Robert Smith, of Burley.*

To the Shepherd, whose master is a member of this Society, who had raised on the 1st of June, 1835, the greatest number of lambs, in proportion to the number of ewes put to the tup on the farm, not less in number than fourscore.

The first premium of 2 sovs. to William Grettton, shepherd to E. W. Wilmot, Esq., who raised from 200 ewes put to the ram, 243 lambs.

The second premium of 1 sov. to John Speed, shepherd to Mr. Bradshaw, of Burley, who raised from 100 ewes put to the ram, 118 lambs.

The other competitors were Wm. Weston, shepherd to Mr. Clarke, of Burley; C. Conson, of Burley, shepherd to Mr. C. Smith; John Harrow, shepherd to Mr. Painter, of Burley; and John Wright, shepherd to Mr. Burgess, of Ridlington Park.

*Also by Mr. R. Smith.*

A Silver Medal to the breeder of the best pen of ewes in Class 10, to the Hon. Col. Lowther, M. P.

**SWEETSTAKES.**—A Sweetstake of 2 sovs., for the best Beast of any breed, age, or weight, was won by Stafford O'Brien's, Esq. Hereford Steer, shown in Class 1.—Competitor, Lord Exeter's Red Steer, shown in Class 1.

A Sweetstake of 1 sov., for the best Sheep of any kind, breed, or age, was won by E. W. Wilmot's Shearing Wether. Competitors, Lord Exeter's and Mr. Bowman's Shearing Wethers, all in Class 7.

A Sweetstake of 1 sov. for the best pen of five breeding Ewes, as in Class 10, was won by E. W. Wilmot, Esq.—Competitor, Mr. R. Smith, of Burley.

**EXTRA STOCK.**—Sheep were exhibited by W. Sherrard, Esq., of Langham; Mr. Wm. Pawlett, of Barnack; Mr. Bowman, of Greatford; Mr. H. Stimson, of Oakham; and Mr. R. Smith, of Burley.

Mr. Lester, of Manton, exhibited a fifteen months old Pig, which was supposed to weigh 50 stone; another was exhibited by Mr. Hayes, of Whissendine.

The CHAIRMAN gave "Prosperity to the Rutland Agricultural Society."

Sir G. HEATHCOTE said, he hoped they would excuse him breaking through the regular routine of toasts, when they heard the health he was about to propose, and think with himself that it was seasonably brought forward, and he was confident that it would be drank with the greatest plaudits; he alluded to their excellent President:—they had all known him for many years in the various capacities in which he had officiated in this county—as an upright honest and independent representative,—a liberal landlord,—and the munificent patron of agriculture. He was sure they would all cordially join with him in wishing that he might long continue to fulfil them, and that they might have many opportunities of seeing him preside at these anniversaries, he gave "Sir Gerard Noel, Bart."

Sir GERARD NOEL said, he should not have presumed thus early to rise to address them, were it not for the extreme compliment which had been paid him, and to prevent an ebullition of enthusiasm which had not been paid to the far more worthy toast which had preceded. He felt it his duty, whilst he held the presidency of the present company, to enforce the order of the Society, and he therefore desired that there might be no rising or cheering. He thanked them for the honour they had conferred upon him, which had been done with as much cordiality as his small merits deserved—that of serving the interests of the Society.

Toast—"The Vice Presidents of the Society."

Col. LOWTHER returned thanks for himself.

G. J. HEATHCOTE, Esq., M. P., said, as his hon. friend had only spoken for himself, it became his duty again to address them. He felt deeply the kind manner in which they had received the toast, and tendered them his best thanks. It was one of his most pleasing duties to come amongst them at these annual exhibitions, as he was convinced these societies were of the greatest possible value, both in an agricultural and moral point of view. In an agricultural point of view, it excited a competition for the production of the finest cattle; and in a moral point of view, it brought the landlord and tenant together in honourable competition, and rewarded the moral and industrious labourer. The interests of the landlord and tenant were the same, and he hoped that good landlords would always meet with good tenants, and that good tenants would meet with good and liberal landlords. (*Cheers.*) By the rules of the society, he was not allowed to touch on any political point, and he would merely say that he wished them better times and better prices, and that those times might speedily arrive. He hoped they would have the same success as they had to-day in the wider field of Smithfield, where most of the cattle which had been shown would go, and concluded by wishing them a happy return of the day.

The CHAIRMAN said the next toast which he would give was the Judges, Messrs. Stokes, Bennet, and Farrow. He would just add, that their judgment had been given with such propriety and impartiality as to meet with the full approbation of the successful candidates, and those who had not been so fortunate.

Mr. BENNETT returned thanks.—They had been exceedingly gratified in attending this exhibition, and though his own residence was sixty miles distant he had come with the greatest pleasure. If the society continued to prosper as it had done during the last two or three exhibitions, it would soon be, if not the very first, the second in the world. He could speak with more certainty if he were acquainted with the societies of Manchester, Liverpool, &c., but within his knowledge it was surpassed by none excepting Smithfield, and he must acknowledge that that show was chiefly indebted to Oakham for its primest cattle. He felt flattered in having an opportunity of thus coming amongst them, to witness so good an exhibition of stock, and such a good exhibition of good old English faces.

Toast—"The Stewards of the Society."

E. W. WILMOT, at the request of his associates, rose to return thanks. He said, they had fearlessly and honestly exerted their best efforts for the interests of the society,—and they took it as an earnest that their efforts

had been successful, and as a great gratification to themselves,—when they saw the superior stock which had been exhibited to-day, the number of people assembled to witness it, and the respectable assemblage of gentlemen who had met them at dinner. He was convinced, more than ever, that exertion and unanimity were only wanting to make them the rival of the greatest society in the world. He wished particularly to impress on their minds that the meeting to settle the bill of premiums would be in January,—and he earnestly requested that all would attend so as the subject might be canvassed by all parties, and then they would not fail of having such a bill of premiums as would give satisfaction to all,—and he hoped, the next time, if possible, they might have better success than to-day. In the name of the Stewards, he begged to thank them for the honour they had shown them, and returned their best thanks.

The CHAIRMAN gave “the Secretaries and Treasurers,” and Mr. H. J. RUPKIN, of Langham Lodge, returned thanks; after which “the Successful Candidates” were given, coupled with the name of Stafford O’Brien, Esq.

STAFFORD O’BRIEN, Esq., returned thanks. Though he felt greatly honoured by being the successful candidate at this year’s exhibition,—he felt it a far greater honour to preside as Vice-President at this meeting. (Cheers.) He alluded to a book recently published by Mr. Baker, who had kindly sent him a copy, and though he agreed with that gentleman in his opinion that there was a great quantity of the primest cattle bred in the county of Rutland, yet he differed with him when he alleged they were also reared here. He knew the county of Rutland, perfectly well, and had passed over he might say every acre; and he did not think the county at all adapted for the rearing of cattle, when brought in competition with Durham, Hereford, and several other counties he could mention. No place, however, he agreed with Mr. Baker, was able to compete with them in the breed of sheep. That gentleman (Mr. B.) had been the greatest advocate for the interests of agriculture, that the county could boast of,—and under his active, energetic, and enterprising direction the Society had made a rapid improvement, and he now, without any exception, considered it the first in the world, as, since its establishment, it had borne off the first prizes for five successive years at Smithfield, two of which he had the honour of obtaining himself. Under this opinion he confided to Mr. Baker the 15/ which had been awarded to him, as the first premium, to be applied by that gentleman to the best interests of the society. (Loud cheers.) He concluded by proposing a toast which the worthy president was wont to drink with the greatest zest, and which he was sure he would not now let pass by without adding his tribute of applause; he gave “the Ladies of the County of Rutland.” (Loud applause.)

The CHAIRMAN gave “the unsuccessful candidates, and also the Grantham, Leicester, Lincoln, and other societies, and success to them in fellowship with the Rutland Society.”

H. WILSON, Esq., of Harlaxton, as a member of the Leicester Society, returned thanks, and said, it would be highly gratifying to the Leicester Society, if the Stewards, or other gentlemen, would favour them with a visit at their next show.

Mr. SHIELD, of Frieston, near Grantham, acknowledged the compliment paid to the Grantham society, and expressed his wish that some of the members of the Rutland Society would attend their next show, to convince them that they were not able to compete with this county. His wish was to see such a show as would enable the small farmer, and even the honest labouring man, to compete with the more wealthy farmer—where a man could compete without being at any extra expense in feeding. As it was, they came here now loaded with oil-cake, and all sorts of artificial feed, which precluded the poor farmer from a fair competition.

Mr. BENNETT, in reference to a remark made by the previous speaker, that the feeding was not taken into consideration by the Judges in awarding the prizes, said that Mr. Shield was in error, for that had been particu-

larly attended to that day, and one of the prizes had been awarded to an animal which had been fed on vegetable food only; and they had classes of all descriptions. Oil cake, it was true, had done great things in bringing cattle to a state of perfection, but he never knew oil cake to make a bad constituted animal a good one,—it never gave solidity to flesh of an inferior quality,—or symmetry and proportion to a deformed and misshapen animal. If the classes were a little larger, and they had a greater number of each shown, they would in a great measure do away with feeding on oil cake. The samples of animals and sheep they had seen that day fed on vegetable food only would be a credit to any county in the kingdom, and they could not expect to see much improvement after this, for they had already come to a state of perfection. (Cheers.)

STAFFORD O’BRIEN, Esq., proposed a toast, which he begged to couple with the name of Mr. Handley. It referred to a question on which there were many conflicting opinions; but it did not allude to anything of a political tendency. The toast was strictly agricultural.—“Success to the new Islington Market.” Those who had witnessed the cruelty and evils practised upon the cattle in Smithfield market, would feel anxious for the success of this undertaking. (Cheers.)

Mr. HANDLEY said, the last time he had met them on a similar occasion he was pregnant with his new offspring; he had now gone his prescribed time, and had brought forth; and they must all acknowledge that it was a monstrous fine baby (laughter); and he now consigned it to their fostering care and favour. He had taken up the subject solely on the idea that it would advantage, in a great measure, the interests of agriculture, and put an end to the horrid cruelty and torture which the poor animals endured in Smithfield; and he was convinced, from the great mass of evidence he had been doomed to hear in committee every day on the subject, through two long and protracted sessions, that agriculture would be materially advantaged by the alteration. The brutality, the inconvenience, and the monopoly now experienced at Smithfield, would be done away with on the opening of Islington market, which he believed would be in February. (Cheers.) He called upon the society to give the new market a trial—to send their stock there until they were convinced that it was either superior or inferior to Smithfield; and he sincerely hoped that good prices would meet them. His offspring was now in their hand, and it must either prosper under their smiles, or sicken and die under their frowns. The meeting to-day, and the stock which had been shown, would demand commendation from every quarter; and he hoped the landlord and tenant would still continue to act in unity, in endeavouring to improve and bring to perfection so great a staple commodity of the country. He felt great pleasure in meeting, for the first time, such an advocate for the interests of agriculture as Mr. O’Brien; and he was confident, with such an advocate, Islington market would have nothing to fear.

Mr. SHIELD gave—“The Father of the County, and his associate, the Members of the County of Rutland.”

Sir GERARD NOEL returned thanks. The recollection of his long service in the House of Commons was associated with the most pleasing sensations. He had had the honour of being a member of that house longer than any gentleman, and he therefore styled himself the Father of the House of Commons; and he felt great pleasure in knowing that, during the long period of his service, he had not lost the esteem and favour of the county he had the honour of representing; and he hoped when he had grown too old in the service any longer to fill the situation with benefit to his constituents, he should have the prudence to retire, and give place to some one else better able to fill the responsible situation. (Cheers.)

G. J. HEATHCOTE, Esq., acknowledged the compliment paid to his father, whose anxiety to promote the best interests of agriculture was too well known to the present meeting to need any comment from him.

H. HANDLEY, Esq., M.P., rose to propose the health of a gentleman well known amongst them, whose energetic exertions for the welfare of agriculture might have

been more fully expatiated upon by some of his neighbours, but not more appreciated than it was by himself,—he gave the health of R. W. Baker, Esq. (*Cheers.*)

R. W. BAKER, Esq., acknowledged the compliments paid him by the hon. gentleman, and also by the worthy vice. He took a survey of the origin and rapid progress of the society, which at first originated in a ploughing match, when he had great difficulty in bringing together nine ploughs; but by honest perseverance the nine ploughs were increased to between twenty and thirty, and the result was a greater improvement in cultivation than had ever been previously witnessed. In the last summer he had distributed prizes for ploughing, 33*l* 10*s*.; for the best cultivated farm, a cup filled with crown pieces, 43*l*.; to 105 occupiers of small allotments, 21*l* 2*s*.; in all, 102*l* 12*s*. for the encouragement of spade culture and good husbandry. He congratulated the society on the extraordinary show of good animals,—and that throughout the day not a single iota of dissatisfaction had arisen to damp their arbour. He scarce knew how to express the pleasure he felt on Mr. O'Brien's munificent return of the prize money that had been awarded to him, and begged to tender the warmest thanks of the society. He hoped they would soon be able to form a class, where the farmer under forty acres, might successfully compete with the more opulent farmer, and where even the labourer might come in for a greater share of competition,—for without labourers the owners of landed property were as nothing; and however humble their means, there was not one of them but could do something for his poorer neighbour. (*Great applause.*)

G. J. HEATHCOTE, Esq., gave—"Success to the cattle which will be sent from this meeting to Smithfield, to compete for the prizes there."

The CHAIRMAN gave—"Lord Lonsdale and the Cottesmore Hunt;" and also "The gentlemen who have this day honoured us with their company, unconnected with this county."

Col. Lowther having retired, Mr. BEVIN (of London) returned thanks. After which Sir Gerard Noel retired from the chair, and was succeeded by E. W. Wilmot, Esq., who gave the health of Mr. Cheetham, the retiring steward.—Mr. C. returned thanks, and said he should leave his stewardship in such hands as would not lead him to regret retiring from the office.—The following toasts were then given in succession, "The Press," "The noble Lord Spencer," "The Marquis of Chandos," &c.—After which the conviviality of the evening was kept up to a late hour and the company separated highly gratified with the day's entertainment.

Mr. Baker's bull, *Gainsboro*, won two premiums at Oakham some three years ago, and four of his breed were shown, three of which won first prizes, and the other a second prize.

## REMARKS ON THE MODE OF BREEDING HORSES AND ITS ADVANTAGES.

The celebrated Hugo Meynell (grandfather to the gentleman of the same name, who resides at Hoarcross Hall, in Needwood Forest, and hunts that neighbourhood), who raised that remarkable fox-hunting fabric, at Quorndon, Leicestershire, which faded away in the hands of Mr. Osbaldeston, was the first to improve the speed of the fox-hound, and give a new character to the highly animating diversion for which he is used. Since the days of the celebrated sportsman just mentioned, no pains have been spared to increase the speed of the fox-hound, and, in consequence, corresponding fleetness or celerity became indispensable in the horse also: for the *elite* (very light weights,) thorough-bred horses would answer the purpose; but as full blood horses, generally speaking, are not equal to welter weights, particularly over a heavy or stiff country, it

became an object of the first consideration to procure horses with sufficient speed and power to carry the latter up to the modern hound. The Earl of Sefton, who became master of the Quorndon establishment on the retirement of Lord Foley, was the first, we believe, who took a second horse into the field; an example which has been since very generally adopted; his Lordship rode about sixteen stone, and for a horse which could carry him up to his own hounds (the Quorndon) for fifteen minutes, he did not hesitate to give five hundred guineas; for a nag which could thus bear him along for twenty minutes, he gave eight hundred guineas. Horses of this description, capable of carrying welter weights up to the fleetest hounds in the kingdom, are very rarely seen in the racing stud; but may be produced in the manner already described, and a market is always open for such animals, where they will fetch prices according to their capacity—particularly of carrying weight. As much power and as much blood as possible should be the maxim of the breeder; and when what is called a half (which will generally be three-quarters) bred mare is put to a thorough-bred horse, the produce is not very far from full blood, the qualities of the horse generally preponderating, particularly in the case of a filly foal. Any person who has followed hounds can scarcely fail to have noticed how *blood* tells in a distressing run; and how very few, if any, of the basely bred nags live to the end of it.

From what we have stated, the advantage to the agriculturist, of breeding annually a foal or two of this description, may be easily perceived; a ready sale, a good price, and little risk in the system.

However, let it be well impressed on the minds of those who may think proper to adopt the plan which we have pointed out, that we are no advocates for subjecting young things to hard work at the usual early period. The racer is frequently backed when only a year old; and at this time, when his bones have attained no solidity, his tendons no firmness, however light the weight may be which is placed on his back, he can scarcely fail to sustain injury. Two-years old races are common all over the kingdom: in these cases something more than 8st. is placed on their back: they go off at score, and run half a mile (the general distance) as it were, upon a wind: how often have we seen two-years old pull up lame from such overstrained exertions, and never afterwards recovered! The most important stakes in the country, the Derby, the Oaks, and the Doncaster St. Leger, for instance, are exclusively for 3-years old; and how often does it happen that the winner of one of these splendid prizes is never able to come to the post afterwards, at least as a successful racer? Nor is this all: from these precocious, or rather premature, exertions arise curbs, spavins, splents, foot lameness, diseased fore legs, which we see propagated from the sire to the progeny, or a predisposition for similar diseases, which seldom fail to make their appearance when the animal becomes subjected to exertion; hence may be traced the indifferent and bad fore legs, so common with such of our horses as have any pretensions to breeding. All this can excite no surprise, when we consider that the horse does not attain maturity till he is seven years old: being pressed to the severity of exertion when in a state of comparative infancy, the evils already noticed are to be expected, if they are not the necessary results.

Such being the case with the racer, let those who

breed for the hunting field be careful not to subject their rising hopes to severe exertion till they have acquired sufficient strength for the purpose. At the same time, let it not be understood that we would have the young animal run wild, that he should continue unrestrained till he had acquired maturity: quite the contrary: we well know, from experience, that if a colt be suffered to enjoy unlimited freedom till he is two or three years old, he becomes very troublesome to manage; and therefore at as early a period as possible we would subject them to the head stall and gentle handling; which, however, should be judiciously managed, and nothing like *play* or *trick* be allowed to debase it: horse play is always dangerous, and frequently degenerates into incurable vice. This gentle handling should be continued till the animal has attained the age of two years, when he should have a very light weight put on his back, and gently led about for a reasonable period; he may be gently *longed*; but, to whatever exercise he is subjected, it should never be so long continued at one time as to disgust him—by which the best tempered nag in the world may be rendered the reverse. Thus, by timely, constant, and gentle means, the young animal is brought or beguiled into the requisite submission, without those violent outrages on his temper and disposition which we so frequently see inflicted by unreflecting and barbarous ignorance.

At three years old the animal may be frequently ridden, but not put to violent exertion: he may also be taught to jump *in hand*: we would thus proceed till he had attained his fourth year, when we should be tempted to shew him hounds—merely shew him hounds, as we would by no means recommend him to be ridden with them. At five years, he might be tried with a short or slow run; and, after having attained his sixth year, he might be regularly hunted. At this period, if not before, plenty of customers would be found for him, and a good price obtained. A farmer bringing two such nags annually into the market would find it to answer his purpose; it would make up for that pecuniary deficiency which he now experiences in the price of his grain.

If the young animal were yoked to light and easy draught occasionally, during his course of probation, we are not aware that any injurious consequences would be likely to result from it.

It is the practice of those who breed for the turf to give the foal, from the earliest period of its existence, as much milk as possible; and, if its dam be incapable of affording an abundant supply, the nutritious beverage obtained from the cow is rendered subservient to the object in view: nor is this all; since, as soon as the young animal can be induced to feed on corn, it is supplied with the choicest oats which can be procured with an unsparring hand. By such means the growth of the foal, like forced vegetation, proceeds rapidly, and it attains, if not an unnatural, at least an extraordinary size. But, if it thus is made to assume the appearance of more advanced age, if a two-years old is thus forced into an apology for an animal a year in advance, it is our decided opinion, that the creature feels the approach of old age at an earlier period also: further, we are much inclined to think, that, although the animal under such treatment attains an extraordinary size at an early period of life, inasmuch as the increasing firmness of the bone and tendon cannot keep pace with the superabundance of muscle which is thus forced upon them,

the creature, though it assumes the appearance of year beyond its age, is not a year increased in strength. To this artificial forcing of nature in the young racer, and the severe exercise to which he is consequently subjected, may be mainly attributed the "*breakings down*" which so frequently occur in the early part of the animal's life: this also we consider the source of the bad fore legs so prevalent on the race-course—some scores of lamentable instances we could mention from memory.

If the system of bringing out the racer at two years old (or even earlier) be continued, it is not likely that the practice which we have just described (of artificially forcing nature) will be abandoned; but we feel convinced that, if those who choose to breed hunters and superior harness and saddle horses, will judiciously assist the operations of nature on animal life, instead of committing a physiological violence, they will bring their animals to market in a much superior form, and at a cheaper rate, though not quite so early.

A foal should be well supplied with that universally nutritious fluid, milk; and, if the dam be unable to afford the requisite supply, recourse should be had to another source, or the injurious effect will very soon be perceptible in the appearance of the young animal. In such case, milk from the cow will answer the purpose, but milk from another mare would be preferable; instances, indeed, are not wanting where a foal reared entirely on extraneous lacteous supply, has in due time proved a superior horse: for example, Cade, a bay horse, foaled in 1734, bred by Lord Godolphin. He was got by the celebrated Godolphin Arabian, and his dam Roxana dying shortly after his birth, he was brought up by hand—whence his name, Cade. In October, 1740, he won the King's Plate at Newmarket, and afterwards became a favourite stallion, was the sire of Match'em, Changeling, Young Cade, and a great number of celebrated racers: he proved more valuable as a stallion than a racer; but, as he must have suffered in early life from the manner in which he was reared, scarcely a doubt can be entertained that his valuable properties would have been much enhanced had he been reared according to the ordinary process of nature.

But to continue.—We would have the foal well, indeed abundantly, supplied with milk; and though we should, for some time, be content without the administration of corn to it, we should feel no hesitation in giving the dam a daily feed, even though she were placed in the best pasture possible. What is generally called a *luxuriant pasture*; that is, meadow land which produces an abundance of coarse grass; we consider by no means the best kind of vegetation to promote the object in view. The mare will afford much milk pastured upon such grass, but it will be found much inferior in quality to this fluid produced from the harder upland grasses, which contain more nutriment in a smaller space; this, with the addition of corn, daily, would answer the purpose, without giving corn to the young sucking foal: if the dam be fed in the manner just described, the foal could scarcely fail to thrive and become vigorous. A luxuriant pasture is apt to produce *roaring* in the highly or thorough-bred horse. A much esteemed friend of the writer, who was fond of a bit of blood, as well for the hunting field as for the course, took it into his head to manure his paddocks; they could not be understood as *upland*, and we cautioned him against the effects likely to result from thus imparting greater luxuriance to the herbage which grew in them. However, he persevered, and for some years afterwards, half the young things reared in these paddocks became roarers.

Having spoken of the evil effects of the present system of forcing young racers upon the course at too early a period, we may in this place be allowed to express our regret that it is likely to continue. We further regret that good stakes are not proposed and made for horses beyond the age of three years. The winners of all the present great stakes must be three year olds; when they are, as well as all superior horses, excluded, as it were, from the course. Some of the cups are open to them, it is true; yet most of these are handicapped; and we think that person guilty of an error in judgment who subjects a sterlingly-valuable horse to such a process, where he is doomed to labour beneath a weight which must reduce him to the level of a jade, and where, indeed, his superior pretensions are generally over-rated.

## AGRICULTURAL DISTRESS.

### TO THE MARQUIS OF CHANDOS, M.P.

It is very mortifying, my Lord Marquis, to find that at all the eatings, drinkings, and meetings, to talk (for that is all) upon the distress which now prevails throughout the agricultural interest, no one has taken the bull by the horns, or fairly submitted the real cause of that distress. They are always beating about the bush. The cause itself is well known to your Lordship, and to the kingdom at large; but somehow or other every one seems shy and very backward in coming forward to develop that cause, although they feel it is now disorganizing every species of property. It is that insatiate monster the National Debt, with its eight hundred millions of principal, its twenty-eight millions of interest, its reckless annual expenditure of sixteen millions, and its frightful unfunded debt of thirty millions. It is this insatiate monster which is withering and destroying all our most valuable institutions, has demoralized the labouring classes, degraded and disgraced the British flag, towed the proud Lord Durham unsaluted through the Straits of the Dardanelles in a filthy, smoky steam vessel, prostrated Turkey, uprooted and scattered the ill-fated Poles, snugly seated the enterprising French into the watch-box of Algiers, opposite Gibraltar, established the Prussian commercial league, will soon send forth a combined Russian, Dutch and American navy into the Mediterranean, and, perhaps, finally expel our flag and commerce from that sea into which, in better days, no nation upon earth dared to peep, without our especial leave and license. This is the monster—this is the cause which requires tackling, as well for the security of the landlords as the landlords; for be assured, my lord, the property of the one is no more secure than the property of the other; and I verily believe the Chancellor of the Exchequer sits daily at Whitehall shaking in his shoes, in expectation of a communication from the Old Lady in Threadneedle-street (sent, perhaps, by a dirty Jew orange boy), to inform him Exchequer Bills are at a discount, and Crown debtors paying them into the bank for taxes, the herald of a convulsion too frightful to contemplate—the restoration of barter. My Lord, for nearly 30 years I have foretold the present state of things, and receive for my reward, neglect, and even persecution, in quarters I had rendered, and still could render, the most essential services. I forgive it from my heart. The fulfilment of my predictions conveys to me no pleasure. But, my Lord, is there no remedy which can restore this country to the prosperous, moral, and religious state of 1792, and make it once more respected abroad, and united at home? I consider it by no means difficult if proper measures are honestly adopted. Let a given number of men, of good practical common sense, of great moral courage, of undoubted integrity and unremitting industry, your lordship at their head, be nominated by the country, or a committee appointed by both Houses of Parliament, if it be preferred, to draw up an honest "*Bill of Sacrifices*," taking as their

basis and guide the admirable Statute of Mr. Pitt, called the Consolidated Fund Act, passed in 1797, the Land Tax Remission Act passed in 1787, and the National Expenditure in 1792. Let them ascertain our ways and means, abolish party, and make it an indictable offence to assume nicknames, whether Tory, Whig, or Radical. Let this Bill, so prepared, be submitted to the consideration of the country, and when by combined wisdom and honest intentions it is perfected, let it be laid before the King (God bless him), in the humble hope he will (thereby securing the safety of the throne), forthwith forward it to both Houses of Legislature, accompanied by his "*congé d'élire*" to pass it without delay. When struggling for a seat in Parliament under the most adverse circumstances, this, and this alone, was my ultimate object. In such a safe and salutary remedy I should still be most happy to co-operate to the utmost of my humble ability. But, although I have no hope of such a consummation, yet, come what may, I will never spend my time, or waste my breath, with the little shilling men, the currency men, the crotchethongers, or the political economists, who will meet and talk, talk and meet, till we are reduced to the state of the Christians at Constantinople, debating points of faith while the infidels were battering down their gates.

The importance of the subject will, I trust, plead a sufficient excuse for using your name to a communication which I intend to make public, not being able, from official duties, to attend the general agricultural meeting in London.—Believing me in great sincerity your Lordship's very obedient and faithful servant,

SAMUEL WELLS,

6, Sergeant's Inn, Dec. 7.

## MURRAIN, COMMONLY CALLED BLACK-LEG.

By Mr. JOHN TOMBS, *Pershore.*

(From the *Veterinarian.*)

*Sep. 7th, 1834.*—I was requested by a farmer, near Eversham, to look at a calf that was very lame in the near fore-leg. When I saw him he was lying down and moaning; pulse very quick and rather weak; dribbling from the mouth; severe lameness of the near shoulder, with a swelling and crackling noise of the part. I bled copiously, and inserted several setons over the swelling. The skin was quite insensible, as the calf did not evince the least pain when the setons were inserted. I gave sulph. magnes. 6 oz.; zingiber oz. ss: the animal immediately vomited it all up. I then horned down a quantity of tepid water, which shared the same fate.

After repeated doses of physic were given, purging took place.

*14th.*—I was surprised to hear the animal was living, and the setons discharging. Givo vegetable tonics.

*Oct. 3d.*—I revisited my patient, who appeared cheerful. It ate and drank well: pulse 40. On opening an abscess at the inferior part of the scapula I discovered some rotten flesh; I traced this putrid flesh by cutting through the common integuments to the spinous process of the fourth or fifth dorsal vertebra: the greater part of the antea and postea spinatus and trapezius muscles was completely decayed, and I removed it with the scalpel, leaving the scapula in some places quite bare; the spine of the scapula about its middle was diseased, which I excised. During the operation hemorrhage took place from two small arteries, which was suppressed by ligatures; a ghastly chasm was left in the shoulder, which I filled up with tow previously dipped in tinct. myrrh, and confined it by sewing the integuments

as closely together as possible. In four days the stitches were cut, and the tow removed; the wound had a healthy appearance, with the exception of the diseased part of the spine of the scapula, to which a solution of zinc was applied. Digestive ointment to the sore.

17th.—The reparative process going on rapidly.

25th.—The spine of the scapula has partially exfoliated. On examination I found a sinus; I enlarged it, and extracted a portion of bone, and used a solution of zinc.

Nov. 20th.—The wound has healed some time; the calf is now upright, sound, and healthy.

### PAPER CURRENCY.

SIR,—A worthy friend of mine, who is a zealous advocate for a new paper currency, asserts that it would be a just and equitable reversal of the evils inflicted by the restoration of cash payments through the famous bill of Sir Robert Peel. If there is any force in the observations made in my former letter, such a measure would be no reversal, at all, of any alleged injuries, but the infliction of a series of new ones, which would fall with the heaviest weight on the heads of their projectors. The restoration of cash payments was a just, and honourable measure, to which the national faith was pledged, and which was called for by none more vehemently, than by the opposition, or liberal members of Parliament. It was, however, the occasion of much distress and inconvenience, chiefly by the increased burthen which it gave to the public debt. For if the bill of Sir Robert Peel had not passed, the depreciation of the bank paper would have taken a most rapid course, and none can tell the point which it would have reached. I heard it asserted, by some leading persons at the Bank, that gold would have immediately risen to 6*l* the ounce. It is well known that in proportion to the depreciation of notes, would have been the lightening of the debt in which they were paid and *vice versa*, but that all the pecuniary concerns of the kingdom would have remained in a state of ruinous instability. I have always considered that return to a metallic currency, under all the circumstances of the case, to have been an act unparalleled in his history of nations or of statesmen. But it had all the inconvenience which attend every extravagant debtor, when he endeavours to settle his accounts, and pay his debts. I have thought that it was a situation in which our equitable departure from strict justice might have been vindicated, and that if the new sovereigns had been coined at 4*l* the ounce, instead of the old standard, the expectations of the nation would have been fully answered, and many evils avoided. This would, however, have been the composition, and not the payment of a debt, so the course pursued was at the least most honourable. I may say, moreover, that I never saw the wisdom or necessity of the sort of war which was proclaimed against paper. If the payment of one pound notes in cash on demand, had been enforced by a summary process, I see no valid reason for their prohibition. They would even so, have served to break the shock. But the establishment of a compulsory currency, under present circumstances, would in my judgment, be an act of gratuitous wickedness and folly.

Then, can the occupiers of the land have no national assistance? Sir Thomas Lethbridge has I think wisely confined their hopes to an alteration in rents, a composition for tithes, and a change

in the corn laws. I will take the inverse order; and I entirely agree with you, that though the change of the system would occasion some present inconvenience, (and that perhaps not so great as is apprehended) yet that its continuance will be increasingly injurious. The graduated scale of duties was one of Canning's showy plausibilities, which overlooked one of the most important circumstances of the case. This artificial scale connected with the bonding system, throws all the power of speculation from the home to the foreign corn, and subjects the farmer and the consumer to an uncalled-for depreciation at one time, and an injurious rise at another, before the speculators can reap the fruits of their outlay. I need not explain to you how the system works both ends of the speculation against the public. I even doubt whether it is not injurious to the importing merchants; for the magnitude of the interest at stake has produced results which, with kindly seasons, have for a long time hindered the speculators from obtaining their object of high prices and low duties, whilst the store of bonded corn serves as an incubus to prevent the English farmer from obtaining those prices, which the state of things would otherwise have naturally afforded them. The importers get all or nothing—the farmers, as a body get nothing at both ends—and the public are the dupes and the victims of this lying system of plausibilities,

“Which keeps the word of promise to our ear,  
And breaks it to our hopes.”

For these reasons I hold that this first hope to the agriculturists arises from an entire freedom in the importation and exportation of corn, subject to such constant and moderate duties as they have a right to demand, and the nation is called upon to grant.

As to tithes, the agriculturists should certainly seek for the establishment of a fixed system, by which gathering them should be prevented, as well as arbitrary alterations. But it seems to me that they have less interest in their actual amount. The great impediment to a reform has hitherto arisen from the apprehension on the part of the occupiers, that the tithes would be increased by any proposed valuation—and so they would. But this would be merely a temporary evil, and might be met by a provision, that wherever the tithes were increased under a lease, it should be deducted from the rent. Afterwards the comparative rate of tithes would not signify, for the rent will always be regulated by them. If by any legal provision the tithes were permanently lessened the rents would rise, and the contrary if they were increased. The landlord will always get all that the tenant can afford to pay—and this being the natural condition of landlord and tenant, cuts off any hope of legislative interference, or of voluntary agreements to reduce rents.

J—S.

Dec. 9, 1835.

The poor rates are in a course of trial.

The Jersey farmers, following the example of their neighbours, are petitioning the States for a prohibition of French produce, and for other measures to protect the agriculture of the country. They especially complain that the exportation to England of potatoes, which are the principal agricultural produce of the country, is now at an end, owing to the extensive cultivation of the root.

**SMITHFIELD CLUB CATTLE SHOW.**

The thirty-seventh annual adjudication of prizes, and of gold and silver medals to fat cattle, sheep, and pigs, took place on Thursday, Dec. 10, in the Repository-yard in Goswell-street.

The stewards, Mr. Thomas Chapman, Mr. Thomas C. Beasley, and Mr. Samuel Druce, classed and arranged each animal in the exhibition, and a number is placed on the standings of those to which the judges have awarded a prize.

Those agriculturists who have been favoured by a view of the grand exhibition, state this is one of the best that has taken place.

The judges, Mr. Samuel Bennett, of Bickering-park, near Woburn; Mr. Laxton, of Morbourn, near Stilton; and Mr. Edward Franklin, of Ascot, near Tetsworth, Oxfordshire, after deciding the prizes by the numbers affixed over the animals, requested the secretary to read to them from the certificates the names of the successful candidates, as follow:—

**CATTLE.—CLASS I.**

For the best ox of any breed, under five years old and no restriction as to feeding, awarded a premium of 20 sovereigns to Earl Spencer, for his four years and ten months old Durham ox, fed on hay, mangel wurzel, Swedish turnips, and oil-cake.

A silver medal to his Lordship as the breeder of the above ox.

The other competitors in Class I. were, Alexander Robertson, Esq., of Balmacassie, near Ellon, a four years and six months old Aberdeen and short-horned ox, bred by John Garden, Esq., of Mill Ardlethen, near Ellon, Aberdeen; fed on turnips and grass, and travelled by steam-boat to London.

Sir Francis Lawley, of Middleton Hall, near Coleshill, Warwickshire, a four years and two months old Hereford ox, bred by him, and fed on hay, turnips, meal, and oil-cake. Highly commended by the judges.

Stafford O'Brien, Esq., of Blatherwycke-park, near Wansford, Northamptonshire, a four years and six months Hereford ox, bred and fed by ditto, and fed on hay, carrots, turnips, beans, meal, and oil-cake. The ox was commended by the judges.

James Trevor, sen., Esq., of Broughton House, near Aylesbury, for his four years and eleven months old Hereford ox, bred by John James, Esq., of Wootton, near Kingston, and fed on grass, hay, and oil-cake. Commended.

William Trinder, Esq., of Wantage, Berks, a four years and nine months old Durham steer, bred by Lord Sherborne, of Sherborne, and fed on grass, hay, turnips, and wheatmeal. The judges commended this animal.

**CLASS II.**

For the best ox of any breed under six years of age, weight ninety stone and upwards, not to have had cake, corn, or distillers' wash, previous to the first of August. The first premium of twenty sovereigns to James T. Senior, Esq., near Aylesbury, for his four years and two months old Hereford ox, bred by the Rev. J. R. Smythers, of Lynch-court, near Leominster; fed on grass, hay, and 600lbs. of oil-cake.

A silver medal to Mr. Smythers as the breeder of the above ox.

The second prize of ten sovereigns, to John Beasley, Esq., of Chappell Brompton, near Northampton, for his five years and three weeks old short-horned ox; bred by T. C. Beasley, Esq., of Harleston, near Lincoln, and fed upon hay, turnips, and 1,715lbs of oil-cake.

The other competitors in this class were as follow:—Sir William Wake, Bart., of Courteen-hall, near Northampton, a four years and eleven months old Hereford ox; bred by S. Smith, Esq., of Stanton Lacey, near Ludlow; fed upon grass, hay, and 1,379lbs of oil-cake.

R. W. Baker, Esq., of Cottesmore, near Stamford; a four years and two months' old Durham ox, bred and fed by him on grass, hay, carrots, turnips, about four bushels of bean-flour, and 1,120lbs of oil-cake.

**CLASS III.**

For the best ox of any breed under five years of age; under ninety and above seventy stone weight, not to have had cake, corn, &c., as in Class II. The first prize of fifteen sovereigns to the Marquis of Tavistock, of Oakley, for his four-years and two months old Hereford ox; bred by Mr. F. Back, Newhouse, near Ludlow; fed on grass, hay, turnips, mangel wurzel, one quarter of bruised oats, two bushels of meal, and 1,100 lbs of oil-cake.

A silver medal to Mr. Bach, as the breeder of the above ox.

The second prize of ten sovereigns was awarded to J. T. Senior, Esq., for his three years and eight months old Hereford steer, bred by William Jellicoe, Esq., of Beigherton, Staffordshire; fed on grass, hay, and 500lbs of oil-cake.

The other competitors were Mr. John Slater, of Haselbeach, near Kettering, a three years and eight months short-horned ox, bred by Mr. William Bryan, of Six-hills, near Loughborough; fed on grass, hay, and 620lbs of oil-cake. Highly commended, but disqualified on account of overweight in this class.

J. M. Bailey, Esq., of Shenley House, near Stoney Stratford, for his three years and two months old Hereford ox, bred by George Wells, Esq. of Creden Hill, near Hereford, and fed on grass, hay, and 500lbs of oil-cake. Commended.

Sir William Wake, Bart., of Courteen Hall, a three years and eleven months old Hereford ox, bred by E. C. Jeffries, Esq., of the Grove, near Pembroke, Hereford; fed on grass, hay, and 946lbs of oil-cake.

**CLASS IV.**

For the best ox of any kind, not exceeding four years and three months, under 70 stone weight, and not to have had corn, cake, &c., as in Class II. The first prize of 10 sovereigns to J. T. Senior, Esq., for his three years and seven and a half months old Hereford ox, bred by William Jellicoe, Esq., of Beigherton, and fed on grass, hay, and 600lbs of oil-cake.

A silver medal to Mr. Jellicoe as breeder.

Second premium of five sovereigns to William J. Bailey, Esq., of Shenley House, for his three years and six months old Hereford ox, bred by W. H. Apperley, Esq., of Withington, near Hereford, and fed on grass, hay, and 500lbs of oil-cake.

The other competitor was Mr. Joseph Kirkby, of Epping Bury, a four years old Highland Scot—fed on grass, hay, and 400lbs of oil-cake.

**CLASS V.**

For the best fat cow or heifer under five years of age, free-martins and spayed heifers not qualified. A prize of fifteen sovereigns to Mr. Geo. Peach, of Great Houghton, near Northampton, for his four years and eleven months old Durham cow, bred by Mr. Dent, of Milton; fed on turnips and oil-cake.

The other competitors were, R. Wm. Baker, Esq., a four years and ten months Durham heifer, bred by himself, and fed on grass, hay, carrots, turnips, bean-flour and oil-cake. Commended.

Mr. Wm. Towns, of Kingston, Surrey, a two years and nine months old Durham heifer, bred by himself, and fed on hay and oil-cake, and never had a calf. Commended.

Richard Rowland, Esq., of Creslow, near Aylesbury, a four years and nine months old Hereford cow, bred by Wm. Clarke Esq., of Hennor, near Leominster, and fed on grass, hay, and oil-cake, never had a calf. Commended.

**CLASS VI.**

For the best fat cow of five years old and upwards, free-martins and spayed heifers not qualified. A prize of fifteen sovereigns to Mrs. Strickland, of Tewkesbury, Gloucestershire, for a five years and one month old Durham cow, bred on her farm at Tewkesbury.

No other competitors in this class.

**SHEEP.—CLASS VII.**

For fat long-woolled wethers, one year old, that have never eaten corn, cake, seed, or pulse. A prize of ten

sovereigns to Mr. Wm. Pawlett, of Barmouth, near Stamford, for his three twenty months old Leicester wethers, bred and fed by him.

The other competitor was William Faulkner, Esq., of Bury Barns, near Burford, three twenty-one months old long-woolled wethers, bred and fed by him.

#### CLASS VIII.

For fat long-woolled wethers, one year old, any how fed. The first prize of ten sovereigns to Wm. Pawlett, Esq., for three twenty months old Leicester wethers, bred and fed by him.

The second premium of five sovereigns to Richard Bird, Esq., of Beeston, Biggleswade, for his three twenty-one months Leicester wethers, bred and fed by him.

The other competitors are Mr. Robert Masters, of Weedon Beck, near Daventry, three twenty-one months Leicester wethers, bred by Mr. John Polterton, of Stone, near Daventry.

Mr. Henry Stimson, of Oakham, near Stamford, three under twenty-two months old Leicester wethers, bred by him.

#### CLASS IX.

For fat long-woolled wethers, two years old, any how fed. A prize of ten sovereigns, to Mr. John Painter, of Burghley, near Oakham, for his three thirty-two months old Leicester wethers.

The other competitors were, Mr. R. Rowland, of Creslow, near Aylesbury, three thirty-two months old Leicester wethers, bred by J. H. Langston, Esq., of Surslon House, near Chipping Norton. Commended.

Richard Foster, Esq., of Southborn, near Driffield, three under thirty-three months old Leicester wethers, bred by him. Commended.

Mr. H. Stimson, of Oakham, three under thirty-four months old Leicester wethers, bred and fed by him.

Geo. Worth, Esq., of Newnham, near Rugby, three thirty-three months Leicester wethers, bred and fed by him; and

William Taylor, Esq., near Chigwell, three thirty-two months old Cheviot wethers, bred and fed by him.

#### CLASS X.

For fat short-woolled wethers, one year old, any how fed. The first prize of fifteen sovereigns to Stephen Grantham, Esq., of Stoneham, for his three twenty months old South Down wethers, bred and fed by him; and a silver medal as the breeder thereof.

The second prize of five sovereigns to the Duke of Richmond, for his three twenty months old South Down wethers, bred and fed by him at Goodwood.

The other competitors were, Thomas Ellmore, Esq., of Beddingham, Sussex. Three twenty months old South Down wethers, bred and fed by him. Highly commended.

The Hon. Peter J. Locke King, of Woburn, near Chertsey, three twenty-one months old South Down wethers, bred and fed by him.

Lord Exeter, three South Down wethers, twenty-one months old, fed and bred by him at Burghley,

#### CLASS XI.

For fat short-woolled wethers two years old, any how fed. The first prize of ten sovereigns to Stephen Grantham, Esq., for his three thirty-two months old South Down wethers, bred and fed by him; and a silver medal as breeder of the same.

The second premium was awarded to Wm. Ridge, Esq., of Upper Stoneham, near Lewis, for his three thirty-two months old South Down wethers, bred and fed by him.

The other competitors were, John Ellman, or Glynde, near Lewes, for his three thirty-two months old South Down wethers, bred and fed by him. Highly commended by the judges.

This pen of sheep won a match of ten sovereigns against three thirty-two months old South Down wethers, bred and fed by T. W. Coke, Esq., of Holkam.

The Duke of Richmond: three South Down wethers,

thirty-two months old, bred and fed by him. Highly commended.

Three South Down wethers, thirty-two months old, bred and fed by Thomas Ellman, Esq.—Commended.

Three thirty-three months old South Down wethers, bred and fed by Mr. Jonas Webb, of Barbraham, near Cambridge. Commended.

James Mardell, Esq., of Wheatherhamsted, three thirty-three months old South Down wethers, bred by Sir T. C. Miller, Bart., of Troyle, near Alton, Hants.

The Honourable Peter Locke King, three thirty three months old South Down wethers, bred and fed by him at Woburn, near Chertsey.

#### PIGS.—CLASS XII.

Pigs of any breed, of the same litter, above four and under nine months old. The first prize of ten sovereigns was awarded to the Earl of Harborough for his three Neapolitan and Chinese pigs, aged 22 weeks, bred and fed by him on barley, wheat flour and skim-milk. A silver medal as the breeder thereof.

The second prize to Mr. Elias Guerrier, of Stepney-green, Mile-end, for his three Norfolk pigs, bred by Mr. William Dowling, Twig-folly, Mile-end; fed on milk and oatmeal, aged twenty-seven weeks.

Mr. F. Farmer, of Thydon-mount, near Epping, for his twenty-eight weeks old Neapolitan and Surrey pigs, bred by Mr. G. Creswell, of Sutton, and fed on barley meal, milk, and steamed potatoes. One of them commended.

Mr. G. Chandler, Kingston, Surrey, three seventeen weeks and six days old Surrey pigs, bred and fed by him on meal, milk, and water. Commended.

William Orchard, Esq., of Hornsey, three twenty-one weeks and five days, old Essex and Hertfordshire pigs, bred and fed by him on barley meal, rice, flour, and wash. Commended.

Mr. Luke Guerrier, of Stepney-green, Mile-end, three thirty-two weeks old Essex pigs.

Mr. William Temple, of Heston, Middlesex, three thirty-two weeks old Berkshire pigs, bred and fed by him.

#### EXTRA STOCK CATTLE.

A silver medal to the Marquess of Exeter, for his three years and three months free martin Durham heifer, which also won the 101 match against Earl Spencer's three years and six months free martin Durham heifer, his Lordship allowing the Marquis six stone for the difference of age. The judges highly commended.

Earl Talbot's five years old Hereford ox. Highly commended.

#### EXTRA STOCK SHEEP.

William Pawlett, a silver medal for his twenty months old Leicester wether.

A silver medal to the Duke of Richmond for his forty-one months old South Down wether.

#### EXTRA STOCK PIGS.

A silver medal to George Chandler for his twenty-two months old Surrey pigs.

The above is one of the most splendid shows ever witnessed. The yard is brilliantly illuminated with gas, so that the visitors can witness the exhibition with as much facility in the evening as by day-light.

#### THE DINNER.

On Monday, December 14, the members of this Club, in celebration of its thirty-seventh anniversary, dined at the Freemasons' Tavern. The company was more numerous than it has been for many years past. Earl Spencer presided, supported on the right by the Marquis of Chandos, and on the left by the Chancellor of the Exchequer.

The cloth having been removed, the following toasts were drunk:—"The King," "The Queen and Royal Family," and "Success to the Smithfield Club." The

noble chairman then proceeded to distribute the prizes to those whom the judges had declared to be the successful competitors. The announcement by his lordship of the award of the great prize of twenty guineas to himself for his Durham ox, was received with great cheering.

Mr. HILLIARD proposed "The health of Earl Spencer, as a successful competitor." Three times three.

His LORDSHIP, in returning thanks, said he believed that the advantage to the country of such a club as this was very considerable. It enabled farmers to see the perfection to which cattle and sheep could be brought. He should think that there were few who could attend the exhibition, without observing some points of excellence which had not been submitted to their examination before. Were there not such a club in existence, he feared the breed of cattle and sheep would rapidly degenerate. (*Cheers.*) When his lordship announced the prize to Mrs. Strickland,

Mr. HILDYARD rose, nobody being present to answer for Mrs. Strickland, to return thanks for the honour conferred upon her, and as it was rather an unusual thing for a lady to be a breeder and feeder of cattle, he thought it would be interesting to inform the meeting who Mrs. Juliana Strickland was. Mrs. Strickland was the daughter of the late Sir G. Strickland, who was celebrated for his breed of Durham cattle even before the time of the celebrated Messrs. C. and R. Collins. At the baronet's death there was a very large herd of his breed of cattle. There were two or three sons, but as neither of them had a taste for attending to the stock, the two daughters, out of respect to their father's memory, kept up the breed, and brought them from the north to a beautiful situation near Tewkesbury, where they have continued the breeding and feeding of cattle, an excellent specimen of which has been exhibited in the cattle-yard. Gentlemen, I believe you will agree with me, that it is much to the credit of these ladies, who, instead of following the habits of their own class in society, in rolling about the metropolis paying unmeaning morning calls, devoted their mornings in looking after their stock, and distributing comforts to the surrounding poor. I think, gentlemen, you will join me in good wishes that Mrs. Strickland may long be permitted to follow that useful course of life which she has pursued for many years past.

In announcing the prize obtained by Mr. Grantham for his Southdown sheep, Earl Spencer spoke in terms of high commendation, not only of the symmetry of the animals, but also of the beautiful texture of the wool. It is no small proof of the excellence of Mr. Grantham's stock, that he should have obtained the superiority over Mr. Ellman's sheep, which had previously gained a 10*l.* match against Mr. Coke.

The distribution of the prizes having been completed, "The Duke of Richmond's health" was drunk with three times three.

The CHAIRMAN then read a list of the names of the new subscribers; that of the Marquis of Chandos, proposed by his lordship, was amongst them. The list was an unusually long one, and his lordship congratulated the club on having obtained so great an accession to their numbers.

The Marquis of CHANDOS said he rose with great pleasure to propose "The health of their Chairman." (*Cheers.*) The noble lord's health had been already drunk, in his capacity of a successful competitor; he now called on them to drink the health of his lordship, as the "President of the Smithfield Club." Drunk with three times three.

The CHAIRMAN said, he did not expect to be called on a second time to return thanks. He had received their approbation in one capacity—he again was honoured with it in another; and he really did not know which to prefer. (*A laugh.*) He was pleased with his prize; he was also much pleased to occupy the situation of President of this Club. It was an office that he thought conferred great honour on the possessor. For the farmers of England to have chosen him as President of this, the principal farmer's club in the country, was one of those honours to which he attached consi-

derable importance. He was always most anxious for the prosperity of the farmers. (*Applause.*) He was a farmer himself, but he hoped that consideration alone did not influence him. He thought it of importance to the prosperity of this country that agriculture should prosper. (*Cheers.*) And the reason why he should always be ready to exert himself to promote the interests of agriculture was, because he derived much pleasure from it.—He entered into its pursuits; he was in the same boat with them; he engaged as a practical farmer to a considerable extent; then he was dependent for his income on farming, for his property was all derived from the land. (*Applause.*) He might have differed with some as to which was the better course to pursue for the advancement of the interests of agriculture, but his and their object was the same, and he assured them that none could have more deeply at heart than he had the interests of the farmers of the country. (*Cheers.*)

The following toasts were then drunk:—"The Stewards," "The Judges of the Stock," "The unsuccessful Candidates," and "Mr. Coke."

The CHAIRMAN gave the "health of Lord Chandos."

The Noble MARQUIS said he considered his election this day a great honour, and he assured them that he would go every length possible to promote their welfare. (*Cheers.*)

"The Manufacturers and Commerce of the country;" "Prosperity to the Labourers of England;" "Live, and let Live" were next drunk, with much applause.

Mr. HILLIARD proposed the "health of the Chancellor of the Exchequer." One or two individuals attempted to get up a cry of "O'Connell," but it completely failed; the cheering was general and most cordial.

The CHANCELLOR of the EXCHEQUER said he would return thanks for the honour just conferred on him, if they would allow one to intrude upon them who did not belong immediately to themselves; but who, nevertheless, did belong to a country which was a part of the United Empire. (*Hear.*) He came amongst them, not only for his private gratification, but also to derive from them the benefit of example and information. He should go to his countrymen and say, "elsewhere in that great country to which we look for example, I have seen the various classes of society united—political distinctions cease—and all rushing onwards in the discharge of one common duty." (*Cheering.*) He thanked them for the honour done him, and he trusted they would allow him to attach himself to them, so that he might in future attend as a member of the Smithfield Club. (*Great cheering.*)

The CHAIRMAN then proposed the "health of Mr. Bennett," the late M.P. for Wilts.

Mr. BENNETT returned thanks.

Two or three other toasts were drunk, after which the company withdrew.

SUSSEX.—The piece of plate offered for the best cultivated farm in Sussex, at the last cattle show at Lewes, was proposed in consequence of similar premiums in Scotland, and this Mr. T. Ellman kindly promoted by announcing his intention of becoming a competitor. Berwickshire, Roxburghshire, and the Lothians have long been greatly distinguished for the advanced state of their agriculture, called mixed husbandry, or live-stock and tillage united, and the result is permanent fertility, from the large quantity of manure supplied by the cattle in the yards, which are well managed, the result of education, practical skill, and sufficient capital, and not from felicitous of climate, in which the southern counties have a decided advantage. It is also much to be attributed to the patriotic, liberal, and active patronage of the proprietors at large, particularly of the Dukes of Northumberland, Roxburgh, and Buccleuch, &c., and the establishment of agricultural societies. The farms on an average consist of 500 acres, and some much larger, let on leases of 15, 20, and 30 years, and many young gentlemen from various parts of England are received for instruction, which cannot be sufficiently learnt from books, though Mr. Robert

Brown's *Treatise on Agriculture and Rural Affairs* can be recommended, and their education is commonly completed by attending a course of agricultural chemistry at Edinburgh. In regard to the conditions of farm servants, those unmarried are generally lodged and boarded in the farmers' dwellings, and those married are supplied with a cottage and vegetable garden each, belonging to the farm, receive 4*l* in lieu of keeping sheep as formerly, and a specified number of bushels of corn, with the keep of a cow, purchased by themselves. And in return they work in any way directed; and have to keep a daughter or woman full grown, ready also to work when needed on the farm, at from 8*l* to 1*s* a-day. Thus being paid principally in corn, the money value of their wages rises and falls without inconvenience to those labourers with their masters' gains at market; and the result is mutual confidence and attachment, orderly conduct, and freedom from incendiarism.

### TO THE EDITOR OF THE FARMER'S MAGAZINE.

"Nature, in her productions slow, aspires  
By just degrees to reach perfection's height."  
SOMERVILLE.

Sir,—The annual show of fat stock at Arundel, took place on Tuesday, the 8th inst., when the following premiums were awarded:—A piece of plate, value ten pounds, to the owner of the best fat ox, without restriction as to feeding, the gift of his grace the Duke of Norfolk, to Mr. Hugh Penfold, of Wiggentholt. A piece of plate, value ten pounds, to the owner of the best fat Sussex ox, fed on succulent food only, the gift of the Corporation of the Borough of Arundel, to Mr. George French, of Angmering. A piece of plate, value ten pounds, to the owner of the best fat steer, under five years old, without restriction as to feeding, the gift of Lord Dudley Stuart, M.P., to Mr. John Drewett, of Peppering. A piece of plate, value ten pounds, to the owner of the best fat Sussex steer, under five years old, fed on succulent food only, the gift of the Earl of Surrey, to Mr. Thomas Duke, of Lyminster. A piece of plate, value seven pounds, to the owner of the best fat Welsh runt, without restriction as to feeding, to Mr. Challen, of Hardham. A piece of plate, value five pounds, to the owner of the best fat Welsh runt, fed on succulent food only, to Mr. John Duke, of Courtwick. A piece of plate, value five pounds, to the owner of the best fat Scotch runt, without restriction as to feeding, to Mr. Harwood, of Amberley. A piece of plate, value seven pounds, to the owner of the best fat cow, five years old or upwards, bred in Sussex, without restriction as to feeding, the gift of the tradesmen of Arundel, to Mr. James Field, of Arundel. A piece of plate, value seven pounds, to the owner of the best fat open heifer, under five years old, bred in Sussex, without restriction as to feeding, the gift of the tradesmen of Arundel, to Mr. Searle, of Amberley. A piece of plate, value five pounds, to the owner of the best fat open heifer, under five years old, bred in Sussex, and fed on succulent food only, the gift of the tradesmen of Arundel, no entry. A piece of plate, value five pounds, to the owner of the best pen of five full-mouthed, or six-tooth fat Southdown wether sheep bred in Sussex, without restriction as to feeding, the gift of the tradesmen of Arundel, awarded to Mr. W. Newland, of Tortington, a gentleman famous for many years past as a successful competitor for the premiums at this annual exhibition of fat stock. A piece of

plate, value five pounds, to the owner of the best pen of five four-tooth fat wether sheep of any description, fed on succulent food only, the gift of the tradesmen of Arundel, to Mr. George Burcher, bailiff to Miss Bushby, of Goring. A piece of plate, value five pounds, to the owner of the best pen of five two-tooth fat Southdown wether sheep, without restriction as to feeding, to Mr. John Duke of Courtwick. A piece of plate, value five pounds, to the owner of the best pen of five fat ewes of any description, each having brought up a lamb since the 1st of December, 1834, without restriction as to feeding, to Mr. Henry Upton, of Binsted. A piece of plate, value five pounds, to the owner of the best pen of five fat Southdown ewes, each having brought up a lamb since 1st of December, 1834, without restriction as to feeding, to Mr. Thomas Suter, Tortington. Three of the above premiums were awarded to his grace the Duke of Norfolk, but on this event, as well as on former occasions, his Grace had directed that the premiums awarded to his stock should be given to the stock next in merit. The stock exhibited by his Grace on this day certainly reflected the highest credit on Mr. Corney, the farming steward, and forcibly illustrated the invincibility of practical knowledge with steadiness and industry of purpose, when combined with adequate means of pursuit. The one-and-twenty months old Southdown wether sheep, shown by Mr. John Duke, of Courtwick, were universally admired. They were bred by Mr. Wm. Oliver, of Courtlands, and were a fine specimen of size, fatness, and weight, and quality of wool. They were estimated to weigh fifteen stone, of eight pounds to the stone. I mention this latter circumstance for the especial information of a gentleman living at Pembroke, whom I once had the pleasure of meeting, and I trust a friend of mine in that neighbourhood, who is a reader of your magazine, will call his attention to the fact.

The Earl of Surrey presided at the dinner, and presented the premiums to the several successful candidates. The judges were, Mr. Harmer, of Brighton, Mr. Maidwell, of Epsom, and Mr. Gains, of Portsmouth; and the stewards, Mr. John Heasman, of Angmering, Mr. Allin, of Arundel, and Mr. John Halsted, of Walberton. The noble chairman was supported on his right by the Lord Lieutenant, Sir Richard Hunter, and Captain Pechell; and on his left, by W. G. R. Graitwicke, Esq. the Rev. Edward Turner, and the Rev. Charles Kinleside. The company consisted of a numerous attendance of the gentry and yeomanry of the neighbourhood.

There were also several premiums awarded to industrious labourers and shepherds producing satisfactory certificates of long service and good character; but in this department, which is so excellent in principle, the noble chairman expressed his intention of introducing several improvements, and this promise his lordship seems disposed to follow up with all promptness, as he has fixed a meeting, having this purpose in view, for the first Arundel market day in January. The noble lord appears fully to enter into the sentiments which the following paragraph contains, and which I have taken from a very clever little work, called "Cottage Comforts." "It is very desirable that the labouring classes of society should be respectable and comfortable in their circumstances; that they should be able to provide themselves with decent habitation, wholesome food, and suitable raiment. The happiness of every benevolent person is advanced by observing

and by promoting the happiness of those around him, and in proportion as its population is thriving and contented, in that proportion is a nation secured both from invading foes and internal discord."

Now this excellent plan of rewarding the meritorious labourer does advance the morals and promote the happiness of the better conducted part of our humble fellow creatures. My shepherd, I am proud to say, obtained a premium from the hands of the noble chairman for attentive and skilful conduct in his occupation. On my return home from the dinner, about 3 o'clock in the evening, I went into the man's cottage, for the purpose of congratulating him on his success, and although he was not in the house, I had no difficulty in discovering that he had been home and communicated the welcome intelligence. The countenance of his wife expressed everything which satisfaction could depict; and the happy looking children, with their bright eyes and smiling faces, quite satisfied that their father, from this event, was become the first man in the realm. Some days have now passed since the occurrence, but still the man, woman, and children are yet happy in the merits of the former having been acknowledged in so substantial a manner by his superiors.—The beef of this day, with the exception of a few large and plain oxen, sold off pretty readily at from 4s. to 4s. 1d. per stone of eight pounds; and the mutton from 4s. to 4s. 6d. The day was particularly favourable for the purpose, and the awards of the judges, together with the arrangements of the stewards, gave general satisfaction.

The Chichester Christmas Cattle Show was on the following day, Wednesday, the 9th inst., of which society his grace the Duke of Richmond is president, when the following premiums were offered:—

CLASS 1. Oxen or steers of any breed, that shall not have had any cake, corn, meal, seeds, distillery wash, or grains, before the 1st of August, 1835.—To the feeder of the best fat ox or steer, a premium of 10*l*. To the feeder of the second best fat ox or steer, a premium of 7*l*. Neither of the above prices were awarded, the stock shown not being of sufficient merit.

CLASS 2. Oxen or steers of any breed, fed on succulent food only. To the feeder of the best fat ox or steer, a premium of 10*l*. To the feeder of the second best fat ox or steer, a premium of 7*l*. The first was awarded to Mr. James Hack, of Chichester, the second to Mr. Ring, of Petersfield.

CLASS 3. Runts.—For the best fat runt, fed on succulent food only, a premium of 10*l*. For the second best fat runt, a premium of 7*l*. The first was awarded to Mr. John Neale, the second to Mr. William Upton.

CLASS 4. Steers under four years of age, fed on succulent food only.—(Welsh runts not qualified to show in classes No. 1, 2, and 4.) To the feeder of the best fat steer, a premium of 7*l*. Awarded to Mr. John Mundy, of Petersfield.

CLASS 5. Fattened cows or heifers (free martins and spayed heifers not qualified), that shall not have had any corn, cake, meal, seeds, distillery wash, or grains, before the 1st of August, 1835.—To the feeder of the best fat cow or heifer, a premium of 8*l*. To the feeder of the second best fat cow or heifer, a premium of 6*l*. The first to Mr. Thomas Sherrin, of Petworth, the second to Mr. James Hack, of Chichester.

CLASS 6. A premium of 10*l*. to the feeder of the best pen of five full-mouthed, or six-toothed fat

Southdown wether sheep, without restrictions as to feeding.—Awarded to Mr. Rusbridger.

CLASS 7. To the feeder of the best pen of five four-tooth fat Southdown wether sheep, without restrictions as to feeding, a premium of 8*l*.—Awarded to Mr. William Upton.

CLASS 8. A premium of 8*l*. to the feeder of the best pen of five two-tooth fat Southdown wether sheep.—Awarded to Mr. Walter Calhoun, of Binderton.

CLASS 9. A premium of 8*l*. to the feeder of the best pen of five fat Southdown ewes, each having brought up a lamb since the 1st of December, 1834, without restrictions as to feeding.—Awarded to Mr. Walter Calhoun, of Binderton.

CLASS 10. A premium of 6*l*. to the feeder of the best pen of five fat ewes of any description, each having brought up a lamb since the 1st of December, 1834, fed on succulent food only.—No entry.

CLASS 11. A premium of 10*l*. to the breeder of the best pen of ten Southdown ewes in lamb, the quality of the wool and the completeness of the animals to be taken into consideration. The ewes are to remain in the flock and to be folded till within one month of the show.—Awarded to his grace the Duke of Richmond, who declined accepting the premium, which was then given to Mr. Walter Calhoun, of Binderton, as the owner of the pen of ewes next in merit.

CLASS 12. A premium of 8*l*. to the breeder of the best six-tooth Southdown ram, the quality of the wool and the completeness of the animal to be taken into consideration.—Awarded to Mrs. Huskisson, of Eartham.

CLASS 13. A premium of 8*l*. to the breeder of the best four-tooth Southdown ram, the quality of the wool and the completeness of the animal to be taken into consideration.—Awarded to Mr. Walter Calhoun, of Binderton.

In classes 6, 7, 8, 9, and 12, there was no competition, but in class 13, Mrs. Huskisson contended with Mr. Walter Calhoun. The gentleman, however, beat the lady hollow; a circumstance which speaks far more for the breed of his sheep than it does for the gallantry of his behaviour. The six-tooth sheep shown by Mr. Rusbridger, in class 6, were of the primest description, and obtained general approbation. There was also a show of boars for a bet of five pounds, between two amateurs of this sort of stock, living near Chichester. The judge appointed to decide this matter was a hog-jobber in the neighbourhood, but the contending parties seemed both determined to be the winner, and so flabbergasted the judge elect by the conclusive arguments they each advanced in favour of their respective animals, that the arbitrator at length concluded that there must be great merit on both sides, and so returned the deposit money to both of the competitors. All disinterested persons, however, thought that one hog came *too far north* for his opponent. The sum of ten pounds was liberally given by Mr. Osborne, to be awarded in three premiums to labourers producing certificates of long service, and bringing up their families without parochial relief. The first premium of five pounds was awarded to William Ayling, servant of Mr. Wyatt, of Chilham, for 29 years' service, and having brought up eleven children without any aid from the parish. The second premium of three pounds was awarded to Francis Humphrey, servant to Mr. Henry Sailer, of Langford; and the third premium of two pounds was given to Thomas Gardiner, servant to Mr. Dervey, of Appledram. This example, alike judicious and generous on the part of Mr. Osborne,

had the effect of setting this most desirable principle (of rewarding meritorious labourers) on foot, and sixty pounds were immediately subscribed to be devoted solely to this purpose next year, when a ploughing match, &c. &c. is to take place. At the dinner, which took place at the Swan, the noble president was supported on his right by the Earl of Surrey and Lord George Lennox, and on his left by Charles Dickens, Esq., and Lord March. The judges on this occasion were Mr. John Ellman, of Glynde, Mr. Northcote, of Tiverton, Dorsetshire, Mr. Gains, of Portsmouth, and Mr. Harmer, of Brighton.

I am, Sir,  
Your obedient and very humble servant,  
AGRICULTOR.

Sussex, December 17, 1835.

THE CURRENCY.

TO E. S. CAYLEY, ESQ., M. P., NORTH YORKSHIRE.

My dear Sir,—I turn from the out-pourings of party politics, and personal remarks, with great satisfaction to your letter, not that I have the vanity to suppose that any observations I may make upon the subject of the currency, would induce you to forego your opinions, but because it is agreeable to one who is inquiring after the truth, to compare his sentiments with those of another, who argues so reasonably and temperately upon the points under discussion; and I cannot but express a wish that the better cause had an abler advocate.

You take it for granted, that I do not deny, that when the Bank Restriction Act gave to the directors of the Bank of England the power to issue paper free from the liability to convert it into bullion, the probability was that they would do so.

I refer, therefore, to Sir J. Graham's pamphlet, for the purpose of comparing the two years issue of the Bank before 1797, with the two years after that period. The result is as under:—

Year.	£5 and upwards.	Less than £5.
1795	.... 13,539,163	....
1796	.... 10,909,694	....
	<u>24,448,857</u>	
1797	.... 11,506,445	.... 1,418,240
1798	.... 11,909,424	.... 1,465,450
	<u>23,415,869</u>	

Thus, in notes of 5*l.* and upwards, the Bank reduced their issues after the restriction act: if the 1*l.* notes be added, they increased them. This issue was probably made to supply the place of gold; and I find the opinion confirmed by the fact, that Bank notes, till the latter part of 1800, bore a small premium, as compared with gold. I can, however, afford to concede the point, for if the issue were less in 1795-6, than in 1798-9, the price of wheat was higher than in the latter period. This brings me to your propositions. "Prices are raised," you say, "by an increase in the quantity of circulating money the amount of commodities remaining the same, &c. &c. &c." Sir James Graham labours hard to prove this: he takes the amount of Bank of England notes and the price of wheat from 1792 to 1809, and places them in juxta position to each other: but it probably occurred to him, that, because two things were contemporaneous, it is scarcely a logical inference to assume that one is cause, and the other effect. He therefore takes the currency of one year, and the price of wheat in the succeeding year, but there are as many variations, contrary to the theory, in the one

case as in the other; and, if he had taken (which is a fair mode of trying the question) the price of wheat in one year, and the currency of the succeeding year, he would have been on nearly the same grounds, fully prepared to argue on either side of the question. He next takes two shorter periods from 1819 to 1822, and from 1822 to 1825; yet in these two tables, whether the currency and wheat of the same year be taken, or the currency of one year and the wheat of the preceding year; or, conversely, wheat and currency, the same result follows in each case. With perfect deference, therefore, to so high an authority, I submit that, on such premises, either opinion must be abandoned,—either is true, or both are true, which is impossible.

I have objected, in a former letter, to these practical views of the subject; which may be (I do not say they are) selected for the purpose of supporting previously formed opinions. You have, however, furnished me with a datum, in the case of the increase of gold from the American mines, on which the question may be fairly stated.

I read in your letter, that for 200 years before these mines were opened, the price of wheat was 10*s* the quarter, and that after this event, the quantity of gold was quadrupled: that wheat rose to 40*s* the quarter, and remained so for 200 years. I do not suppose that wheat was always 10*s* or 40*s* in each and every year; because the sun and the rain must have equally affected the harvests, as in these, our days; but that, taking the average, before and after the fresh supply of gold, the result was such as you have stated. I will, therefore, in accordance with this principle, take the currency and price of wheat for given periods, from 1793 to 1830; averaging the amount of Bank of England notes issued in each year, by the number of years in each period; and averaging the price of wheat in a similar manner. I take Bank of England notes, as the test of currency, on your authority; some greater tyro at figures than myself, may perhaps supply the remainder. I adopt Sir James Graham's figures, as far as they go, to 1819 inclusive: after that period, those of Marshall. I give your proposition a great advantage in this, because I take no notice of the gold issued, to avoid any difference of opinion as to the quantity in circulation. The first two periods contain six years each; the remainder, five years each, and the Bank of England notes are stated in millions only. The first year of the different periods is inclusive.

Average amount of Bank of England

Years	Notes. Millions.	Av. price of Wheat.
1. From 1793 to 1804	.... 14	.... 77 <i>s</i> .
2. From 1804 to 1810	.... 17	.... 78 <i>s</i> .
3. From 1810 to 1815	.... 24	.... 100 <i>s</i> .
4. From 1815 to 1820	.... 26	.... 77 <i>s</i> .
5. From 1820 to 1825	.... 20	.... 55 <i>s</i> .
6. From 1825 to 1830	.... 20	.... 61 <i>s</i> .

Or, again, I take the average amount of Bank of England notes, and the average price of wheat for 20 years before 1797; and the same also for the past year. They are as under:—

Years.	Average issue of Bank of England Notes. in Millions.	Av. price of Wheat.
1. From 1778 to 1798	.... 9	.... 48 <i>s</i> .
2. 1834	.... 18	.... 40 <i>s</i> .

From these statements, I am led to infer that the price of wheat is not governed by the amount of the circulating medium.

I may also observe, that the fall of prices com-

menced from the moment the Government ceased to borrow. In those loans a fictitious paper found a resting place, and the industry of the country was mortgaged to pay the interest of them. While this process was going on, and while a Government Contractor was in every market, the demand continually exceeded the supply, and prices rose; but the cause having ceased, the effect ceased also; nor will any tampering with the currency, by forced issues of paper, by whatever means produced without these, ever permanently raise them.

But the experiment was tried in 1816 and 1822; and your account of those transactions shows how it failed. The history was concluded in 1825, by the ruin of thousands, and by bringing the country within 48 hours of barter. Let us now pursue a wiser course; and do that in 1836, which ought to have been done in 1825.

Reduce the taxes, and the local burthens upon agriculture; and place them equally on the monied and the landed interests. Two tricks have already been played with the currency, and have failed—be ware of the third time. Whether the standard of value were rightly fixed by Peel's Bill, it were needless to inquire: a change would not undo an act of injustice, but would commit it afresh. Suppose the plan of depreciation to succeed to its fullest extent, it could only affect contracts already subsisting; for all future ones would immediately be regulated by it. The private creditor, who lent his hard cash, or the tradesman who gave credit but yesterday, would be deprived of their just due to the extent of the depreciation; if the object be to reach the Fund-holder, it were, at all events, more open and straight-forward to do it by direct, than by indirect means, and leave private creditors untouched. But the purpose may be attained honestly, if the monied class be made contributory, equally with other classes, to the general expenditure of the nation, and there is no just reason, why they should be exempt.

In conclusion, I beg to express a hope, (I own the motive to be a selfish one,) that our intercourse, which commenced in public, may be extended to the social communications of private life.

I remain, my dear Sir, very faithfully yours,  
Kesgrave, Dec. 16, 1835. R. N. SHAWE.

## A SMEARING MACHINE.

TO THE EDITOR OF THE WEEKLY JOURNAL.

SIR,—From the unprecedented demand for white wool to supply the increasing consumption of our manufactures, which is at this moment much greater than at any other period, since the introduction of the woollen manufacture into Scotland, a great proportion of the sheep farmers in the Border counties have been induced to abandon the practice of smearing their flocks with tar and butter, and to adopt the much-approved-of system of salving with powdered crude white arsenic, and black soap, in the proportion of one pound of arsenic to three of soap, which are mixed up with seventy bottles of water, and has been found sufficient for threescore and ten sheep, being at the rate of a bottle for each, the expense of which does not exceed sevenpence a score. However, in place of soap and water, I would with much confidence recommend that the arsenic should be mixed with butter and cocoa-nut oil, and only to that extent which is necessary to give fixity to the arsenic, which I have no hesitation in pronouncing, is a salve calculated to produce wool of the purest possible description. It is a well-known fact that a

successful lambing time very much depends upon the condition of the ewe; and it must appear evident to every one experienced in store-farming, that sheep under this treatment are much more likely to thrive in a stormy winter, or in a high and exposed situation, than those to whom the arsenic was applied with water and a mere fractional part of soap, and their wool will not only be considerably finer, but very materially increased in quantity, independent of any additional weight that may have been added by the application of the butter and cocoa-nut oil, and will be found to possess in a greater degree the felting properties, consequently much more valuable as a clothing wool, or indeed for the manufacture of any description of goods to which the material can possibly be applied. In consequence of the vessels of the skin in tups being in a state of high activity at the time of smearing, (the tups being then in season), the absorbent power on the surface of their bodies is very great, which explains the different degrees of effect which the smearing ingredients exerts on the ram in comparison with other kinds of sheep. It is well known that grease or any unctuous substance acts as a protection to the skin, from the power of any caustic or eating substance, which is unquestionably the nature of rock arsenic and other smearing materials. Of all salvings hitherto introduced for producing white wool, the arsenic is allowed to be decidedly the best. Mr. Murray of Kednure, and the Messrs. Oliver of Williamstoe, Peeblesshire, had the merit of being the first who tried the experiment in Scotland; the moment it is applied, all vermin of every description die instantly; and it is the opinion of many of the most experienced in sheep-farming, that stock under this treatment will in a very great measure be exempted from the loup-*ing-ill*, a disease which kills thousands annually upon lands which are much infested with tick, and a slight repetition of the salve early in March upon the *forespald* of the sheep would more than probable be attended with the most beneficial effects. From the nature and properties of the composition, many of the diseases which unsmearing flocks are liable to be infected with, are at once eradicated or prevented by the application of the salve, which also destroys all inclination for rubbing against foggy or grassy banks, and thereby prevents the wool from getting imbedded with impurities which are not unfrequently found to such an extent, that the wages of labour in picking it sufficiently, adds so much to the price, that too often the manufacturer is obliged to apply it to an inferior purpose, and even when the material has been carefully looked over by the most discerning eye, previous to its being submitted to the process of manufacture, it frequently happens that thousands of the impurities make their appearance in the finished article, which in a great measure renders it unfit for the purpose for which it was intended. Sheep salved in this manner are seldom or never found to die in consequence of their falling awl, or the wool to peel off previous to clipping time; however, many and very frequent objections have been made to this mode of smearing, on account of breaking or shading of the wool, which never again closes, except the salving material possess some adhesive properties which the one in question certainly does not; in consequence of this, many farmers of late years have allowed their flocks even in high and exposed situations to winter, without a salving of any description whatever; this practice, except in some very peculiar situations, can seldom, with propriety, be continued above a year or two, as under this treatment the quantity and quality of the wool invariably falls off, and seldom fails to produce a kempy fleece; or, in other words, the wool gets imbedded

with dead white hairs, which renders it unfit for any valuable purpose, and thereby materially reduces the value of the fleece. To obviate this objection, I would, with no small confidence, recommend the use of a salving apparatus, which might be constructed for a few shillings, from a piece of brass tube of that diameter which could readily be admitted between the skin and wool, without breaking the staple of the fleece; the apparatus will require to be pointed, shut at the end, and a slit cut in the tube half the length, the other half to be constructed upon the principle of a syringe which can be readily filled from the vessel containing the smearing material, and when inserted between the skin and wool of the sheep to be salved, the slit will require to be uppermost, when a slight pressure with the hand upon the piston will at once discharge the liquid into the other half containing the slit, which, upon being turned upside down, the tube will at once be discharged of its contents; and before it be withdrawn, the piston should be forced down to the utmost extremity of the tube to prevent the possibility of any of the material being left. Various other instruments might be adopted, such as the common syringe, or one with one or more holes in the side; the first, however, is quite superior in principle to the two latter, and I have no doubt whatever, if the Highland Society were to offer a prize of five pounds or guineas, for the best model of a machine for smearing sheep, that before next season, one would be produced of so efficient a construction, that a sheep could be salved with the same despatch that a printer can at this moment throw off a newspaper. Your giving a place to the above in your widely-circulated publication, will oblige, sir, your most obedient servant,

R. BOYD.

Marmion Place, Banks of the Leithen,  
7th December, 1835.

**COWS FED ON FISH.**—Mr. De Capel Brooke, in his interesting travels in Lapland, mentions a fact at which the English farmers will be much surprised, viz., that the cattle in Lapland, or Finmark, are uniformly fed on fish. I already, he remarks, fancy to myself seeing the English farmer's mouth open, and hearing him express his pity that a poor beast should be born to exist in such a country, and on such a diet. His surprise at the same time will not be lessened, when he hears that the animals not only devour this kind of food with the greatest eagerness, but thrive and do well upon it. What will our great cattle feeders say to this? or how would they look if they were told, that by the extension of our fisheries, a beast might, perhaps, be fattened in a shorter time, and more economically upon cod fish than by the old fashioned means of oil-cake? or that instead of manuring the ground with sprats, they may be introduced as an advantageous substitute for turnips, for our sheep in winter? It appears that horse dung, when it can be procured, is also boiled up with the fish bones, and greedily eaten by the cattle, in Lapland and Norway. As the process by which the food is prepared for the cattle is curious, it may not be uninteresting to the English farmer to read the account. About five o'clock in the evening, a large iron pot is regularly placed on the kitchen fire, partly filled with water, into which is immersed a large quantity of fishes heads and bones, with the addition of some hay; and this is to boil gently for some time, till a kind of fish soup is prepared. The pot is then taken to the cow-house by the maid-servant, and its contents are placed before the animals by being poured in their mangers. I was much surprised to observe the extreme relish and greediness with which they devoured this; both sheep and cows appeared equally fond of it. The milk is of a remarkable rich flavour, and the beef and mutton very good.

## ON BAR SHOES.

By Mr. E. CHARLES, *Clarges Street, London.*  
(From the *Veterinarian*.)

A BAR shoe is a nearly circular piece of iron, applied to the foot of the horse, and is so called because, when first used, a bar was most probably welded across the heels of a common shoe.

The diseases, to the cure of which the bar shoe is most frequently applied, are corn and sandcrack; and the effect sought to be produced is, the creation of a space between the shoe and the foot, so that no part of the weight of the animal shall bear on that portion of the foot which requires protection.

In a foot to which a bar shoe has never been applied, there is little difficulty in keeping a shoe, however clumsily it may be made, from bearing on the diseased part; because, the frog being in most cases higher than the heels of the crust, the bar of the shoe rests upon it, and the heels of the crust are thereby relieved entirely from the pressure of the shoe. But when, by the constant use of a bar shoe, the frog is worn down level with the heels of the crust, it becomes necessary that the shoe should be made to adapt itself to the altered state of the foot. This is done by making the shoe considerably thinner for the diseased or tender part, and leaving it thicker over the frog, that it may come in contact with that organ, while still at some distance from the heels.

Another advantage is gained by this form of shoe; viz. a perfectly flat gound surface: the quarters are also preserved, which under other circumstances, are almost sure to be destroyed; and when the frog and quarters are worn away, the difficulty of keeping the shoe from bearing on the heels is increased in proportion to the length of time the shoe is worn. Hence, it often follows, that a horse that wears a bar shoe once, wears it for ever, as it actually produces the disease it was meant to cure.

I am perfectly aware that it is much easier to shoe horses on paper than it is in the forge; and I also know, there are some feet which can only be shod so as to make them go sound in the very sort of shoe I would condemn as generally mischievous, viz., one of which is bent up to keep it from touching the heels, instead of being made thin over the heels, more particularly the outer edge of it, which is opposite the crust; but these owing to several causes which do not properly belong to this subject, are getting very rare; and some of them have no doubt, been produced by being shod, in the first place, with the shoes they are now compelled to wear.

Now, though I must confess that the art of shoeing at some forges in London is brought nearer perfection than it ever has been before, yet I was led to make these remarks, by having lately seen several bar shoes, which had been put on at some large establishments, totally devoid of principle, both in the construction and application, and yet finished in a very superior manner, and highly creditable to the makers as mechanics. This is a state of things that ought not to exist at the present time; and though I am fearful this will not be read by many who are entrusted with the important duty of fitting and putting on the shoe, I think their employers may derive both honour and profit, would they attend to this branch of the art themselves; instructing those who are ignorant of the principles of shoeing, and confirming, by judicious explanation, those who are doing the thing properly, in many instances, I am afraid by mere accident.

**SMITHFIELD SHOW—PRIZE CATTLE.**

Subjoined are the weights of some of the Oxen and Sheep which obtained prizes, with the names of the butchers by whom they were purchased.

	No.	st.	lb.			
Mr. Grantham's three Southdown Wethers, which obtained the gold medal, as "the best pen of Short-woolled wethers," also ten sovs. and a silver medal, were purchased by Mr. Giblett, of Bond-street, and weighed .....	} 1	21	0			
				} 2	20	6
Mr. Painter's three long-woolled fat Wethers which obtained a premium of ten sovs. and a silver medal, also purchased by Mr. Giblett, weighed .....	} 1	20	5			
				} 2	19	3
Mr. Senior's Ox, bred by W. Jellicoe, Esq., which obtained a prize of ten sovs., was purchased by Mr. Bridge, of Lambeth, and weighed .....			124st.			
Loose fat .....			18st. 4lb.			
Mrs. Strickland's Fat Cow, which obtained a premium of 15 sovs. and a silver medal, was purchased by Mr. Randall, of Oxford-street, and weighed .....			172st.			
Loose fat .....			24st.			
The Marquis of Tavistock's Ox, which obtained a prize of fifteen sovs. and a silver medal, was purchased by Mr. Sylvester, Chancery-lane, weighed .....			165st.			
Loose fat .....			25st. 1lb.			
Sir F. Lawley's Ox, purchased by Mr. Giblett, weighed .....			184st.			
Mr. Senior's Hereford Ox, bred by the Rev. J. R. Smythies, which obtained a prize of twenty sovereigns, was purchased by Mr. Giblett, and weighed .....			169st. 2lb.			
Mr. Beasley's Durham Ox, which obtained a prize of ten sovereigns, was purchased by Mr. Smith, Drummond-street, and weighed .....			232st. 5lb.			
Loose Fat .....			27st. 4lb.			
			No. St.			
Earl of Harborough's Pigs, 22 weeks' old, which obtained a prize of ten sovereigns, were purchased by Mr. Sheppard, Skinner-street, Somers Town, and weighed ..	} 1	27				
				} 2	25	
Mr. Peach's Durham Heifer (of which a plate is given in this Magazine) was purchased by Mrs. Somers, Somers Town, and weighed .....			159st.			
Mr. Chandler's Surrey Pig, exhibited as extra stock, was purchased by Mr. Willocks, Tottenham Court-road, and weighed ....			15st.			
Earl Talbot's Hereford Ox, exhibited as extra stock, was purchased by Mr. Sheppard, New Cut, and weighed .....			238st. 6lb.			
Loose fat .....			19st. 5lb.			

**DRAINING.**

It has been often said that he who makes a blade of grass grow where a blade of grass never grew before, is a benefactor to his country, and surely it is not less true that he who makes a portion of the soil produce double or treble the amount of grass or grain which it produced before, is no less his country's friend. Following out this view we recommend to our agricultural friends to make themselves acquainted with the system of draining now being carried into effect upon the lands of Rotchell, in the immediate vicinity of this town, by Mr. Robinson, from the county of Cumberland. It is now, we believe, about 25 years since a W. Elkingham, in Lancashire, (if we mistake not) discovered by accident a mode of draining, for which he received a patent, and in reference to which he published a treatise; and though

his discovery was followed out by himself with success, and, since the expiry of his patent, has been followed out, with not less success, by many others in England, we are not aware that it is well known or much practised in this part of the country. Mr. Elkingham's system, as followed out by Mr. Robinson, is, to a certain extent, simple, and in common with what has been done by many in this district, namely, to cut a pretty deep drain along the most hollow part of the land requiring to be drained, but instead of simply cutting all the other drains presumed requisite a certain depth, and then covering up the whole, he carefully examines the various strata excavated, and if he is not satisfied when he has cut a reasonable depth, that he has caught the spring, he perforates, or *taps*, as it is technically expressed, by means of a long iron bar, in the hope that he will hit upon it, knowing that the water will rise to the height of the source from which it proceeds, if required. In this he may not always succeed in his first attempt, but by perseverance, we understand, he seldom or ever fails in his purpose, though he has sometimes to bore to a very considerable depth. If we mistake not he mentioned to us that he had bored not less than 21 feet from the bottom of a 6 feet drain, before the water followed the instrument. The instrument itself is remarkably simple. It consists of a long square bar of iron, if we may use the expression, with two cross bars, and by means of a screw these cross bars can be fastened higher or lower as the arms of those by whom the instrument is wrought may require. The square of this long bar is not more than an inch and a half, and in adhesive soils the aperture made will scarcely exceed two inches, but this has been found sufficient, and when once made in the proper place is certain to be kept open by the power of the water rising from the spring. We cannot at present enter at length into this subject, and, besides, we are aware that though description might seem plain to ourselves who have visited Mr. Robinson upon the grounds, it could not convey a clear conception to those who had no other information upon the subject; we are certain, however, that they who visit Mr. Robinson at Rotchell will find themselves amply repaid for their time and trouble. They will find Mr. Robinson at once discreet and intelligent.—*Dumfries Herald.*

**TO PRODUCE A FINE SAMPLE OF WHEAT.**

Select for your seed the best stock adapted to the soil that you can procure, (white and red mixed is mostly to be preferred, but they should be grown separately and mixed afterwards,) cure it properly to prevent smut, let your land be dibbled and set, and in the Spring well hoed and kept as clean as a neat garden, this will admit a free circulation of air to the plant, and cause many grains to come to perfection which would otherwise be shrivelled: as soon as the grain is arrived at maturity, let it be cut, (if you wait till it is fully ripe, it will make weak flour, more particularly upon light soils,) and if the straw be dry, stack it immediately, not waiting for the hardening of the kernel, which process should always take place upon the stack, as exposure to the sun injures its colour: it ought always to remain upon the stack till the kernel becomes dry and hard, and get it into the barn when the air is dry, let it be thrashed out upon a good oak floor; if the weather be dry whilst thrashing, expose it as much as possible to the air, and if the weather be damp exclude all the air you can.

A MILLER'S OBSERVATION

## AGRICULTURAL REPORTS.

## NORTHUMBERLAND.

Since my last report the weather has been, and continues, very changeable, as is very usual at this season of the year, with frequent gusts of wind and some heavy rains, which have saturated the earth, and filled the springs plentifully with water, so that the thrashing mills have now got into full action, and will have to work double shifts for some time, to enable the poor farmer to discharge his arrears with his landlord, as it now takes double the quantity of wheat to raise the same sum it did some few years ago, the prices being nearly one-half less—the best price for wheat here is 4s 4d, barley 3s to 3s 4d, oats 2s 4d to 2s 8d per bushel; beef 5s to 5s 6d per stone, mutton 4d to 5d per lb.

Turnips prove a very failing crop in general; potatoes are also a very deficient crop, which will be found a great loss to the poor labourer.

Wheat will be found an average crop in general, with some exceptions—barley, also, a full average. Oats rather below an average, owing to the very dry summer. Beans a bad crop. Peas a full average one.

I am no politician, nor do I pretend to know much about politics, only I perceive something particularly wrong in our system. At present the agriculturists are sinking to the lowest ebb of degradation and ruin, whilst the manufacturer and mechanic are reaping the benefit of their industry. I envy no man's prosperity—I rather rejoice to see our manufactories and our commerce flourishing; but still at the same time I should like to see the agriculturists have some small part of the prosperity with their wealthy neighbours.

In my humble opinion, which every true Englishman has a right to express in a respective way, Mr. Peel's bill has been the sole cause of our agricultural distress, to the advancement of the manufacturer and mechanic: from clear proofs he was the cause of my capital being reduced nearly one-half, and unless that bill be repealed, the landlord must be content with about half of the present rents, or the English farmer sink to the lowest ebb of degradation and ruin.—*Dec. 4.*

## GLAMORGANSHIRE.

The agricultural operations on the farm during the past two months have been chiefly confined to the sowing of wheat, or taking up the potato or mangel crops, which operations have been very considerably impeded by the heavy rains that have fallen, amounting to a greater depth than we have noted for many years. In October the extraordinary quantity of 8 in.  $\frac{3}{4}$  fell, and in November, 5 in. 7-10; on the 26th of October we had 2 in. in little more than 24 hours. We need scarcely remark that after this excess of moisture the land is completely saturated, and rendered unfit for the plough except on dry soils. In too many instances the wheat seed has been deposited in a very unfavourable manner. October proved also cold and ungenial, and the grain vegetated very slowly. Latterly the temperature has been higher, and the

wheat braired has shot forth and now looks well on dry soils. The breadth of wheat sown is less than usual, still it is much greater than the present price requires. Turnips are a very deficient crop, and the bulb increased very slowly in the autumn from the cold weather. The grass land seldom produced less keep than in the present year. In former dry summers the pastures are generally very productive in the autumn, but in this season it has been otherwise, and they have been unusually bare in stock of every description, and consequently low in condition. The consumption of hay must be great before May, and we expect it will become scarce. At our recent fairs the show of fat stock has been less than has ever been known, and good beef is worth 5d and mutton 5 $\frac{1}{2}$ d to 6d a lb, but store cattle are unsaleable. The corn market is still low, especially for wheat, although some small improvement is lately visible. The price is under 5s a bushel, which is greatly below the cost of producing it. Barley about 3s 6d, and oats 2s 6d.

We hail with considerable satisfaction the prospect of a Central Board of Agriculture being established in London. Such a measure cannot fail to be of signal service to the agricultural public, not as a political engine, which we would strongly deprecate, but as a measure which would bring together the landed proprietor and the leading agriculturists, whether Whigs or Tories, from all parts of the kingdom, to investigate, like other classes, any public measure which immediately affect their own interests.—*Dec. 3.*

## FIFESHIRE.

The weather for the past month has been very mild and rather showery, but pretty favourable for out-door work. The young wheat that is above ground is well planted and healthy; but a great part of it has not yet sprouted, and the breadth sown is not nearly so great as usual. On dry land the pastures have all the greenness of spring, and as potatoes and turnips are both scanty, cattle are still to be seen in the fields. The prices of grain are uncommonly low—down to what they were in a former century—and the present state and prospects of the farmer are truly distressing and gloomy. Every body has his own particular panacea to prescribe for relief, but the only medicine we have any faith in, for giving immediate and lasting relief, is an immediate and permanent reduction of rent. Potatoes are still bringing high prices; but as there was a very extensive failure of the crop, it is only the few individuals who were so fortunate as to have even ordinary crops who will be benefitted by the high rate at which they are selling.—*Dec. 1.*

## DUMFRIES-SHIRE.

Most of the potato land intended for wheat was sown during the first half of the month, which was dry though cold. The continued rains and drenched state of the soil since the 15th, have prevented further progress, and there will probably be little more sown in Dumfries-shire this season, the low prices

affording no encouragement to run the risk of failure, which in most situations of this county frequently attends spring sown wheat. For a good many years past, the *braird* at the end of November has not appeared so backward; nor, indeed, perhaps has there been so small an extent sown.

Sheep improved on turnips during the dry weather, but the late heavy rains has been most unfavourable for them. It is in such weather, and during storms of snow or frost, that there seems no doubt but that a portion of grain, say to the extent of three half-pence or two-pence worth of oats per week, may be very profitably given in addition to the turnips. Without such addition and great care, it will be found that in an unfavourable season few of the October black-faced widders can be put in condition fit for the Liverpool market.

**CATTLE MARKETS.**—These have continued, both at home and in the South, in a most depressed state. The average sales have been lower during this month than they have been at the same season for 35 years; nor can the oldest farmer remember a year in which so many cattle were weekly left unsold in the Dumfries market during November. In Norfolk, the demand has been of late better, and a smaller number of Scots cattle than usual at this season remain unsold; but the prices have not improved, owing mainly to the scarcity of turnip, and the consequent high expense to be incurred by fattening exclusively on oil-cake and grain. The prices of Smithfield being fully above those of the average of the last ten years, and 15 per cent. more than some of extreme depression, gives a reasonable hope that our lean stock will obtain better prices in the spring—at least when the season of grass approaches.

**SHEEP.**—The markets for Scots ewes in Yorkshire, in the beginning of the month, became most deplorable,—numbers were left unsold, and, for the first time almost ever known, many lots returned to Cumberland and this county to be wintered. There seems to be a complete overstock of breeding sheep over England, added to which the pastures in the latter autumn have been very unproductive. The store farmers here might be much discouraged, were it not that wool, in price and demand, is continuing firm; and the consumption of butcher meat in the manufacturing districts being great, is an important circumstance in their favour.

The Liverpool markets have been very low for the half-fed old ewes which have been sent from the county; but for the turnip-fed widders and year-old sheep, which may be ready for Christmas, and likewise for well-fed bullocks and heifers, there is almost a certainty of good demand and remunerating prices, which now nearly reach 6d. per pound. Every year we may expect that greater quantities of good stock will be early ready for the market, and thus better regulate the supply during the season. The practice of stall-feeding Galloway cattle is yearly on the increase, though as yet too small a proportion of the best stots are kept for this purpose.

**GRAIN.**—Barley has been largely exported at from 3s. to 3s. 2d. per imperial bushel. The sample is inferior in quality to expectation, and the weight averages only 52 or 53lbs; but the produce per acre being considerable, more money will be realized from the grain than last year. The shipping season for wheat and oats has not commenced, but the prices of Liverpool indicate only the extreme low rates of 4s. 6d. to 4s. 8d. per bushel for wheat.

#### IRELAND.

In giving a report of the produce and state of the crops, it gives us satisfaction to have reason to ad-

mit, that there is a better system of husbandry more generally practiced in many parts of the country, and that a spirit of industry is fast extending, especially in such counties and districts as have been blessed with a resident gentry. Indeed, it is interesting to observe the different shades of civilization which are to be witnessed where the natives have been encouraged to pursue industrious habits, and where the want of employment has left them inactive and ignorant:—in the former case, a few acres are advantageously cultivated and produce food for hundreds—in the latter hundreds of acres only support a few head of cattle, or supply firing to an impoverished and comfortless population; because, there is neither capital or skill to bring such land into profit. This we should be happy to see otherwise, but although much has been suggested by intelligent and practical men, which, if put into practice, would reclaim a great extent of waste lands, and give bread to an immense population in the western parts of Ireland, yet the work is but slowly progressing. Gloomily, however, as this state of the Western part of the Island exhibits, it is cheering to find, that the Northern and Eastern Counties are treading fast on the heels of the Sister Country in agricultural improvement; which must naturally extend itself in every direction for the general benefit of the country. This was precisely the case fifty years since in England—Mr. Coke of Norfolk, introduced an improved system of husbandry among his tenantry, which was proved so beneficial that it was adopted before 20 years almost by every county in great Britain. Sir John Sinclair was as zealous in the cause in Scotland as were the agricultural Patriots in England, and that part of the empire, seeing the great advantages to be obtained from a good system of husbandry, by their perseverance and industry, brought cultivation nearly to the height of improvement. We therefore confidently hope that Ireland, having so many advantages of soil and climate, may yet have to boast of her superiority in husbandry; and this we are satisfied will soon be the result, if the example of the few spirited individuals in the cause of patriotic improvement now residing in the country will be followed.

With respect to the Crops generally, there is, except very partially, no deficiency, and it may be truly asserted “there is plenty to eat, but little means to purchase.” This abundance of food, however, does not seem to be beneficial to the community generally, for all classes complain of the want of money, and none gain by the excessive low prices of provisions except artisans and labourers, who still receive high wages, notwithstanding they can support their families at nearly half the expense they were enabled to do some years ago. Most Landlords have reduced their rents, and taxes are usually moderate, yet this is not sufficient to ensure a profit to the farmer who embarks his capital and industry, at a risk, in agricultural pursuits, yet an unreasonable part of the community expect cheap bread, although it causes the ruin of those who produce it. We are well acquainted with the expense of raising and sowing corn and other crops, and we are satisfied that the present prices of grain will not pay first cost—even admitting the land at the lowest rent that the proprietor can possibly afford it; and was it not for the introduction of clover leys as a preparation for wheat, these few years past in the corn districts, farmers living solely by raising grain must have been long since obliged to throw up their lands. It may, however, be supposed, from the title of our periodical, we are solely advocating the *farmer's* cause,

and that of land proprietors, in deploring the depressed state of agriculture; but an unprejudiced and impartial view of this subject, will satisfy every rational person that there is a reciprocal interest with respect to trade and manufactures, necessary to be upheld throughout every community; and in order to maintain the separate interests of each they should have equal advantages. On this principle it was argued by some politicians, that the present prosperity of our manufacturers would be certain to rise the sinking interests of agriculturists, but in this the latter have been disappointed; for, notwithstanding there must be an increased demand for land produce, in consequence of the increasing wealth of the manufacturing population, yet the importation of foreign grain being either admitted or smuggled, inundates the home market and depresses our prices below what the article can be raised at. The question, then, is—How are we to meet this depression? It is said the rents must be still lowered, and the land relieved from a great portion of its present taxation. This we'll admit, will in some degree lighten the expenses, but will it be an effectual remedy for the existing depression? Certainly not. For we can enumerate many instances in which crops of wheat, even on good land, have not paid the costs of cultivation, and others, where cattle have been sold for less money than was expended in feeding them. It may be said, what has this last observation to do with the reduced prices of grain? But let it be recollected, that the poverty of the cultivator of the soil, in consequence of these low prices, often obliges him through necessity to dispose of his live stock also prematurely, by which an over supply of beasts are brought to market, consequently a fair price for a few prime ones only is obtained. Thus it is that poverty creates poverty, and not even industry or a good system can counteract the difficulties to be surmounted under existing circumstances. In fact, the remedy rests solely with the legislature.

Having little to observe as to the State of the Crops at this season, we shall take the opportunity of making some observations on "Rural Economy"—as in this it must be admitted, many of our farmer requiresome "hints;" and being confident that often as much is gained by good management of a farm, as by good cultivation. For example—why should cocks of hay be allowed to remain in the fields till the bottoms are injured by damp, and their tops saturated with rain? If cocking is necessary, which in some cases may be so, surely a few weeks are sufficient to season the hay, preparatory to its going into a rick, yet in many farms it is left out two or three months, during which time it loses much of its valuable properties, and also diminishes much in quality. There is also a practice of stacking corn in the fields for the purpose, it is said, of securing it, and seasoning the grain fit for large ricks. This, however, can be better effected, and equally safe, by putting the sheaves into stooks, and if the weather be showery, to hood or cap them; by which method much less grain will be wasted, and much expense saved in the harvesting. In the stooks the grain will receive the full benefit of the sun and air, which in stacks is excluded, and when those latter are afterwards removed, the grain will shed much more than had the sheaves been saved in stooks; indeed, the stacking of corn in the fields is seldom to be seen except in Ireland.

The timely weeding of corn and other crops is much neglected; and as it is well known that "one year's weeds, brings seven years' seeds," it is the

worst of management to allow them to grow at any time: they also much impoverish the land and diminish the value of the growing crop, whether of corn or grass. We have however observed with much surprise, meadows and pastures overrun with luxuriant weeds during last summer, although one man with the scythe could cut down loads of them in a day, which might be converted afterwards to valuable manure by adding them to the fermenting dung-hill!—In fact, this is the chief reason that grass cannot be so expeditiously saved in Ireland, for being so full of weeds, these latter require a much longer time to wither, and until this is effected, it is not safe to put the hay together in large quantities. There is also another error often committed, in not shutting up grass land sufficiently early, by which mode the advantage of early cutting is obtained, and afterwards a good bite of aftergrass also. This system secures the improvement of the land by pasturing a heavy stock of sheep for several months. If such matters therefore, relating to rural economy, are not duly estimated by the farmer, we have little hopes that his his pursuits will prosper, even were the prices of produce 20 per cent. higher than at present.

Many fields of potatoes are still undug, although perfectly ripe, which is judicious both as to this crop and that which is to follow (if wheat,) for much wet or severe frost will prevent it being sown at this favourable time. We regret to see the lazy-bed system practised on newly broken up leys in many districts:—it is far preferable to drop the potatoe sets into cuts made by a narrow spade, as practised in the County of Kilkenny—then to lay on rotten manure, or ashes, and trench the ridges. The sods being thus cut, will receive moisture more freely and rot faster, which will consequently insure a more luxuriant growth of crop. The sowing of wheat is generally deferred later than was usual some years back; and this is attributed to the mildness of the winters for some years past, the farmer being apprehensive that by sowing too early, when vegetation is not likely to be checked, the crops might become *winter proud*. No doubt this often happens, and requires consideration: but eating off the plants in February, or early in March, is an effectual remedy in such case against a superabundance of straw being produced, and of ensuring a more productive crop of corn, and of better quality, than had the plants been permitted to shoot up too quickly. This system cannot be recommended, however, on shallow or arid soils, for should a dry spring follow, the plants would not sufficiently cover the ground in time to resist injury from drought; and in such case a deficiency, both of straw and corn, would be the result.

The turnip system is partially introduced in some counties, particularly in the North of Ireland where generally a spirit of improvement is fast extending. We are sorry however to observe, that the working class of farmers seem not as yet to appreciate the advantages of this root, at least it appears so from their neglecting its cultivation. In some places where sown the plants are not afterwards hoed out to proper distances, therefore but few of the roots arrive at a profitable size. It is idle to sow this crop when every thing necessary to promote its growth is not in due time performed. The great abundance of hay now secured, should encourage the accumulation of manure made by well fed cattle.—This, as Young says, should be esteemed the "gold dust of the farmer." B.  
—*Irish Farmers' Magazine.*

## AGRICULTURAL INTELLIGENCE, FAIRS, &amp;c.

CHIPPENHAM CATTLE SHOW was fully attended, and the stock exhibited gave great satisfaction. The fair, as well as the great market, happening on the same day, the town was more numerously attended by farmers, factors, and dealers, than was ever before known, and business to a very considerable extent was transacted; in fact the great improvement which has of late taken place in the town was visible to all. Joseph Neeld, Esq., M.P., who has on all occasions so liberally exerted himself for the benefit of the town and neighbourhood, was present; as were also H. G. Boldero, Esq., M.P.; John Neeld, Esq., M.P.; with many of the neighbouring gentlemen. The Judges, Messrs. E. Wm. Rich, James Stratton, and George Toghill, awarded the premiums and bounties as under:

FIRST CLASS.—*Fat Cattle*.—1st prize, value 5*l*, to Mr. Samuel Ferris, Bulkington; 2d ditto, 3*l*, Mr. John Brown, Minety.—1st bounty, 3*l*, Mr. John Dark, Broughton; 2d ditto, 2*l* ditto

SECOND CLASS.—*Dairy Cows*.—1st prize, value 5*l*, to Joseph Neeld, Esq., Grittleton; 2d ditto, 3*l*, Mr. Richard Blackford, Malmesbury.—1st bounty, 2*l*, Mr. Rich, Chippenham; 2d ditto, Mr. Christopher Beaven, Highway.

THIRD CLASS.—*Bulls*.—1st prize, value 5*l*, to Mr. Chapman Wick; 2d ditto, 3*l*, Joseph Neeld, Esq., Grittleton.—1st bounty, 2*l*, Mr. Daniel Holbrow, Knockdown; 2d ditto, 2*l*, Mr. John Little, Biddestone, 3d ditto, 2*l*, Mr. Christopher Beaven, Highway.

EXTRA STOCK.—A bounty of 3*l*, to Mr. John Dark, Broughton, for two breeding heifers; ditto of 2*l*, Mr. Thomas Henley, Preston, ditto; ditto of 2*l*, Mr. D. Holbrow, Knockdown, four fat wethers; ditto of 1*l*, Mr. Witcheil, Church Yatton, for hilt in farrow; ditto of 1*l*, Mr. Stephens, Hullavington, for cart stallion; ditto of 1*l*, Mr. Henley, Scanley, for fat pig.

The premiums will be distributed at a meeting of the subscribers, to be held at the New Hall, Chippenham, on Friday next, when resolutions will be entered into for the show of cattle for the year ensuing.

A remarkably fine heifer, only four years old, was killed by Mr. Harris, of Highworth, on Tuesday last. It was grazed by Mr. Geo. Akerman, of Little Blunsdon Grove Farm; her weight was 19 score 10lbs per qr., loose fat 180lbs, hide 136lbs. She was pronounced by good judges to be one of the finest cutters ever seen in that neighbourhood.

ASHBOURN FAIR.—There was a large supply of store stock, which met with rather a dull sale; there were but few fat beasts shewn, which fetched 5½d to 6d per lb; the quantity of sheep penned was not great, and sold at 5½d to 5d per lb. Horses were limited in number, and of an inferior description. Three prime fat heifers were shown; one belonging to Mr. E. Etches, fed by Mr. Wood, of Yatshill, Staffordshire, which won the silver cup and six guineas stakes at Rugeley cattle show; one belonging to Messrs. Marples, fed by Mr. Smith, of Swarkestone; and one belonging to Mr. Bridden, of Tissington, fed by Mr. Hassall, of Hartshorn, in this county. They were allowed by judges to be three of the best heifers ever shewn in Ashburn. Mr. Wm. Tomlinson and Mr. Wm. Miers shewed a prime fat wether sheep, which won the prize at Rugeley cattle show; two ditto by Messrs. Marple, bred and fed by Mr. Gould, of Pilsbury; and two ditto by Messrs. Spencer, bred and fed by Mr. Smith, of Blore. The whole could not be excelled for their beauty and symmetry in this county.

SALISBURY.—Our annual great market, or Gilding Tuesday, as it is called, on account of the fattest ox having his horns gilded, took place on Tuesday last, when the cattle exhibited were of the finest description; indeed such a show has not been seen in Salisbury for many years, there being between 700 and 800 head in the market. The largest ox was purchased by Mr. Spencer, of Southampton, but the fattest beast (that with the gilded horns) was purchased by Mr. Judd, butcher, of this city. The next in size and weight was purchased by Mr. James—all realizing very high prices. Some excellent beasts were also purchased by the other respectable butchers in this city; and the whole had a very quick sale, at the high price of from 11s to 13s per score. Prime heifers fetched from 8s to 10s per score. Cows, from 7s to 9s. The sheep exhibited were also remarkably fine, the primest fetching 6½d per lb., and inferior ewcs and coarse horns, 5d to 5½d. Some fine oxen from Somersetshire attracted particular attention, and were admitted by the best judges to be equal to any exhibited in our market for many years. We understand they were bred by Mr. Brown, of Butleigh, near Glastonbury.

At BOTLEY CATTLE MARKET the premiums were adjudged as follows:—Five sovereigns, to Mr. George Atkins, of Barton, for the best fat ox; three sovereigns to ditto, for the best fat heifer; a piece of plate, value 1 sov., for the best fat pig, to Mr. Benham; a purse of 20s. for the best fat pig, shown by a labourer, to Thomas Shawford. Mr. Atkin's ox and heifer were considered excellent, and as there was no competition for the two first prizes, there was no hesitation on the part of the judges as to who was entitled to them, and therefore Mr. William Barfoot, of Chicken Hall (whom Mr. Atkin deputed to take his place at the table and to receive the prizes, as well as to state that the money would be preferred to the tankard and soup ladle), made a very suitable address on receiving it. The competition for the pigs was great, there being many extraordinary fine ones shown.

YORK CHRISTMAS HORSE SHOW. — This great mart for horses of all descriptions, openly commenced on Tuesday, Dec. 15, though on the previous day much business was done in the several yards of the inns of the city. The show of hunters was rather thin, but there being several buyers, from the South in particular, they were readily sold at great prices. In short, we are told that nothing like a good hunter could be obtained for less than 100*l*.; many fetched a still higher price. The inferior horses were very numerous, but the high prices of the hunters had an effect upon the nominal value of them, though they did not sell so high, in proportion, as the others. We understand that there were several of our army agents present, and also an agent from Don Carlos, of Spain, who seemed either not to know the difference in horses, or to think that any sort would do for the Spanish Insurgents. Upon the whole the aspect for breeders was very good; for the dealers had visited the neighbouring villages, some days before, and had made considerable purchases.

We are informed that the prize heifer shown by Mr. Fussell, of Laycock, and the Hereford Ox, fed by Mr. Unthank, of Tottenham Park, Wilts, both exhibited at the last Bath Agricultural Meeting, together with a Buffalo Heifer, also fed by Mr. U., are now slaughtered by Messrs. Wyatt and Hill, of Marlborough, and are allowed by all judges who have seen them, to be three of the most complete carcasses ever killed in that town or neighbourhood.

## MONTHLY REPORT OF THE WOOLLEN TRADE.

DEC. I.—The state of the woollen trade of Leeds, during November, has borne a pretty close resemblance to the weather experienced in the same period, that is, it has been dull and heavy. The trade of this month seldom bears any better character, though, we think, this year, it has been more than usually flat. Several causes contributed to this; two are most prominent. The weather, though wet and unpleasant, has been mild and warm for the season, and the sale of winter goods has been considerably checked in consequence. The demand for double milled goods has still further been considerably affected by the substitution of pilot and mohair cloths, especially in the metropolis, where the gentlemen appear to think that bear-skins are a very appropriate accompaniment to the ladies' coats. The trade in middle priced and fine single milled goods has also been checked by the increasing consumption of buckskins, which have been so much in demand during November and October, that they have been bought, or ordered, whilst in the loom; as these are chiefly manufactured in the neighbourhood of Huddersfield, and in Saddleworth, the trade of those places has been marked by considerable animation.

Notwithstanding the general dulness of the Leeds trade, there has been a great deal doing in army goods and low cloths generally; whilst in Petershams an unusual quantity has been sold throughout the season. The dulness of which we complain is in fact principally confined to the trade in middle and fine woollens, both single and double milled, and this has been so much counterbalanced by the activity of other branches, that we believe if the trade of the woollen district of the West-Riding be taken as a whole, there has been a fair average amount of business done in November. The change of taste is unfavourable to Leeds generally, most of its manufacturing establishments, as well as a large proportion of those in the surrounding villages, being occupied with the very description of goods superseded by that change.

As a relief to this rather sombre account, we may state that the demand for the United States is expected to be fair; shipments to some extent have already been made, and during this month, the general belief is, they will be considerable. Should this expectation be realised, and we have strong reason to believe that it will, the winter months will pass over without any great relaxation of manufacturing operations, as the spring demand for the home market may be calculated upon in February, and the stock of suitable goods in the hands of the wholesale houses and the drapers cannot be great. We say *cannot be great*, because the kinds of goods usually wanted in the spring have been just those which have been scarce during the autumn; and though they are now accumulating in the warehouses, the American trade may fairly be expected to reduce them; and we greatly doubt if an average stock will be found in the manufacturers' hands on the opening of the spring trade.

Wool is looking upwards in price. An actual advance, indeed, has taken place on the lower qualities—say from 1s 10d to 2s 6d per lb. This description of wool has been deficient in quantity for several years, and has been for the same period disproportionate in price to the finer qualities. It is also that kind of wool which is most affected by the state of demand for comb-

ing wools, and it is in these qualities of colonial wools that the woollen and worsted manufacturers alike deal. The briskness of the stuff trade during the last three months had its effect on the late sales of colonial wools, and, in consequence, all the clothing wools of corresponding qualities have risen in price. In the qualities above 2s 6d an advance, though not so considerable, has taken place, and from 2s 8d to 3s wools may be quoted a shade higher. We much doubt, however, whether any advance corresponding to the advance on wools under 2s 6d will be effected, and we are quite sure it is most undesirable. The trade in middle and fine woollens, for the reasons already given, and for others which we could name, will not bear any additional burthen. The advance on wools in the spring season has been seriously felt by the manufacturers for several years back, and has invariably been accompanied by a diminished demand, and by contracted profits. Let the causes be what they may—whether, the substitution of other articles of wear, or increasing and successful foreign competition,—the trade in the qualities alluded to has regularly proved itself unequal to bear up against a rise of wool; and should the eager expectations entertained in some quarters of a rise in middle wools be gratified, we think it requires no gift of prophecy to prognosticate that it will materially cramp the trade. Of this, at least, we are sure—there is so strong feeling amongst the manufacturers on the subject, that they would, in the event of a rise, greatly contract their operations. The woollen trade, though fair for many months back, has little buoyancy; it does not partake of that onward energy which has for some years characterised the flax, cotton, and worsted trades, and though we hope better things of it in future, we are bound to say that it is not equal to any additional pressure, either from a rise in wool, or a more vigorous continental competition.

WOOL MARKET.—A correspondent in the *Morning Chronicle* says, "A considerable consternation has within these few days manifested itself in the wool market, which seems to forbode an eventful change in this branch of our national commerce. At an exhibition which it had been determined should from henceforward be held annually, a sample of wool of Prince Metternich's flocks was so very much superior to any thing that had hitherto been brought to market, that the usual purchasers could not be prevailed upon to make an offer for any sort whatever—probably fearing, and not without cause, that the whole of the Prince's wool would be of a similar quality, which would greatly affect the value of those sorts which have hitherto been considered the best. It was at the same time well known that the Prince's success was owing to a Mr. Barthels, of whose knowledge, scientific as well as practical, the Prince had wisely availed himself. This gentleman had devoted eighteen years to the study and practice of cultivating, improving, washing, &c. of sheep, which enabled him to form and act upon a system entirely his own. But ignorance, jealousy, and envy (generally the opponents of any new system, however beneficial,) so obstructed his anxious desires of benefiting his country, that Mr. Barthels resolved to leave his ungrateful countrymen to their old habits and deep-rooted prejudices, and to carry his acquirements to Australia. This being the cradle of Great Britain's future greatness in this branch of her commerce, I have no doubt Mr. Barthels will be received with cordiality, and that capital will not be wanting to support his exertions. At first it was reported that he had gone to the United States, but public as well as private accounts contradict this statement, and declare his having gone to Australia. From this you may judge of the importance attached to this gentleman, now that he is gone; and you cannot wonder at the backwardness of the purchasers, although years must elapse before the effects could be seriously felt."

## REVIEW OF THE CORN TRADE

DURING THE MONTH OF DECEMBER.

The Corn Trade throughout the month in Mark Lane, as well as the influential Country Markets, has exhibited no symptoms of animation or novelty to relieve the dull uniformity which has now so long pervaded the proceedings in grain. Owing to the damp and humid state of the weather during the early part of the month, which materially affected the condition of the wheat samples, the fine dry qualities have suffered less depreciation in value than other descriptions, but still these parcels formed so small a proportion of the receipts from the farmer, that he has been realizing ruinously low prices for his produce, totally inadequate to his remuneration, even had he not to deduct the amount of rent from the nett proceeds. On the other hand, barley, beans, and peas have been bearing a more than relative value, and compensating him in some degree for the sacrifice he has been obliged to submit to in the disposal of the more staple commodity; as however was natural to anticipate, the high rates of barley have induced an influx of the article on the various markets, and the currencies are fast receding to their proportionate value. The depressed character of the markets and the small modicum of rent which landlords in many instances are enabled to obtain, has aroused many of the larger landed proprietors and tenants to unite in order to concert speedy and effectual means for their relief. Many parties, some of whom are actuated by political and interested motives, others from erroneous impressions on the subject, are adverting to the abstruse question of the currency, and depicting in strong colours all the miseries emanating from Sir Robert Peel's bill of 1819, and the consequent alteration in the monetary system, instilling into the minds of the farmers, who, not reflecting on the point, are readily imposed upon, that their only escape from pending ruin, is reverting either to an issue of paper, or substitution of a silver for a gold currency, or, in other words, a debasement of the currency, thinking to verify the trite axiom of "two evils to choose the least;" all however that is urged, is mere verbiage, affording an opportunity for eloquent and oratorical displays, but the arguments like the currency recommended, are devoid of intrinsic and sterling value. At the late agricultural meeting, the Earl of Stanhope appears to have discovered, that unless the farmer's means were proportioned to his expenditure, he must become destitute, one of the few observations of his lordship, which are not to be contraverted; his lordship concluded his speech by moving a resolution

to the effect, "That nothing can remove the present overwhelming distress of the farmer, but the adoption of some measure which will either raise the price of produce to the level of the burdens imposed, or bring down the burdens to the level of the prices;" in order to effect the former, a fictitious capital is advised to be created, by debasing the currency, or a paper issue of money, destroying our foreign credit, and affording merely temporary relief; to effect the latter, a modified system of taxation, *tithes*, and *rent*, must be resorted to. Tampering with the currency has been ever found a dangerous and fallacious expedient; while the latter plan of "bringing down the burdens" on the above principles is the only practicable method of affording substantial and permanent relief.

The supplies of wheat have been large, and exceeded those of the previous month by more than 25,000 qrs. The closing month of the year is generally one in which farmers are compelled to thrash out freely in order to meet their pecuniary demands, and if barley or other grain is not held, wheat must be brought to market. The millers, as the supplies also of flour have been liberal, have not bought freely, and the trade has ruled dull with a depression in the finer qualities of 1s; good secondary descriptions having suffered a decline of 2s to 3s, and inferior 3s to 4s; but prime selected parcels are worth nearly as much money at the close as they were at the commencement of the month.

The principal shipments of bonded wheat have been to Madeira, Malta, Guernsey, and St. Johns, the prices realized being extremely low; Prussian hard wheat offering at 20s to 22s. The amount of bonded corn in the kingdom, which is 614,751 qrs, exhibits a decrease during the month ending 5th of December of 5,607 qrs.

The price of Town-made flour remains nominally unaltered, and though 38s is still the top quotation, it is hardly in any instance realized, the general prices being 31s to 36s. Ship's qualities have met a slow sale at the previously depressed currencies, good country qualities being taken at 29s. Several shipments of bonded flour have been made to the West India Islands and Mauritius, and the article continues to meet a partial demand for export. The stocks have diminished in the kingdom upwards of 7,000 cwt., and few parcels of sweet are offering on the London market; sour qualities are worth 13s to 19s per barrel.

The only alteration in the duties has been an in-

crease of 1s 6d per qr on barley. The duties being, on wheat, 50s 8d; barley, 19s 10d; oats, 19s 9d; rye, 27s 3d; beans, 16s 9d; peas, 16s 9d.

The arrivals of barley have been considerable, and have exceeded those of November by upwards of 26,000 qrs, the receipts during the week ending the 12th of December having amounted to 24,400; being one of the largest supplies ever received at the port of London within a similar period. Finer qualities of Chevalier formed a small proportion of the bulk of the imports, and have suffered less depreciation than the intermediate qualities of malting, which are 4s to 5s per qr cheaper than at the beginning of the month, Chevalier being 2s to 3s lower, but at these reduced rates maltsters came more freely forward, and the stands have been tolerably well cleared of all the better descriptions; distilling and grinding sorts have hung on hand at a decline of 2s to 3s per qr; good grinding samples being as low as 23s to 24s, and Irish, weighing 27 to 28 stone, noted at 21s to 23s per qr. The crop of barley is no doubt abundant, and as prices are still bearing a higher relative value than wheat, we may look forward to large supplies of the article during the months of January and February; indeed, in reviewing the gradual increase in the consumption of malt in London and its vicinity, as annexed, it has become of material import that not only the yield of the grain should be productive, but a greater breadth of land should be cultivated with the article, as the inquisitorial and unjust character of the law relative to malting, forces the maltster to select only the most kindly qualities, which will malt within the period limited by the Excise. The following is the amount of malt consumed in London and its vicinity during the last five years:—

1831.	1832.	1833.	1834.	1835.
qrs.	qrs.	qrs.	qrs.	qrs.
622,549	604,477	588,688	662,713	699,990

The stock of bonded barley in London has diminished during the month ending 5th of December 273 qrs, and in the United Kingdom 3,843 qrs. Prices in bond have sustained no variation, being noted at 13s to 15s per qr.

The Malt trade has been dull and declining, and is 1s to 2s per qr. lower for the finer qualities; brewers having got well into stock, have refrained from appearing at market, and hence the languor which has pervaded the transactions in the article.

The supply coastways has been liberal, and the show of other samples good. The new malt meets general approbation, the last growth of Barley malting tender and kindly.

The importation of oats has been on a very limited scale, particularly of Irish; the supply from them having been 24,657 qrs less than during October. In the early part of the month the trade exhibited little animation, dealers and consumers weekly anticipating larger supplies. Good fresh English, Scotch and Irish feed however maintained their former quotations, and only the light, inferior and ill-conditioned Irish receding in value to the amount of 6d to

1s per qr; towards the close of December, good fresh qualities were saleable at fully the previous currencies, and the trade firmer, the weather continuing cold, and the consumptive demand increasing. The opinion still prevails in Ireland that the price of oats will advance, and prevents the rates in that country from attaining a point which permits of general business being transacted; prices free on board remained steady at from 9s to 10s 3d as in quality. The export of bonded oats has been confined to a few hundred quarters to the West Indies. The amount of bonded oats in London on the 5th of Dec. was 83,935 qrs, which with the arrivals, shows a diminution of 644 qrs as compared with the previous month.

The damp weather having affected the condition of Beans at the beginning of the month, prices receded 2s to 3s as the supplies were liberal; the cold weather having however improved them with rather an increased demand, the prices have not further given way, remaining firm at the depression. Old scarce, and fully as dear.

White peas have remained steady with a good demand, but maple and grey have declined 1s to 2s per qr.

During the month of December the following quantity of grain and flour has arrived in the port of London:—

	Wheat.	Barley.	Malt.	Oats.

In France little variation has taken place either in the price or demand of grain, at the principal markets. At Paris the cold weather experienced, was inducing the expectation of an advance in the price of flour, as the rivers generally remained remarkably low, not containing more water, in many instances, than in the month of August. At Rouen the same causes were operating on the currencies of the article, and fears entertained that a scarcity of flour might occur, though there was abundance of wheat on hand, so few water mills being enabled to use their full power. At Nantes, the demand for the Mediterranean having subsided, the trade was dull, but the better qualities of wheat were still held at 35s 10d per qr. At Bordeaux wheat had obtained high prices, owing to an animated demand having arisen, and the supplies continuing short; the finest qualities were noted at 42s 9d to 43s 10d, and good samples, as Machecoul, &c., 40s 5d to 41s 7d, and

WOOL MARKETS.

BRITISH.

There has been a fair demand for most kinds of Wool until the last few days, when the time of the year has prevented business transactions. There does not seem to be any disposition on the part of the manufacturers to give the prices which the dealers are now asking, and from present appearances the prices must remain stationary, until some new feature on the aspect of the trade appears.

JANUARY 1.

The public sales of Wool last week consisted of 803 bales New South Wales, 53 bales Van Diemen's Land, 319 bales Spanish, and 838 bales other sorts; they were well attended, and commenced with animation at about the same rates as the last public sales. Some good lots of New South Wales Wool sold from 2s 3d to 2s 9d per lb, and others from 1s 4d to 2s 6d; the Van Diemen's Land Company's Wools were fine in the hair, but badly got up, they sold 1s 9½d to 2s 6d; some part of the New South Wales and Van Diemen's Land Wools were very much damaged, so much so that 3d and 6d was all that could be obtained. The German Lambs and Skin Wools sold at good prices, German Lambs 2s 1d to 2s 10d, ditto Skin, 1s 7d to 2s 4d. Of the Spanish only the two first marks were sold at 2s 5½d to 2s 6½d; the other marks not landed.

BONES.

# THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

[Our object in appending a Political Companion to the Farmer's Magazine, was to put our readers in possession of the opinions of the most talented journalists of the day, on both sides of any important question which might come under discussion. We trust, therefore, that in giving insertion to articles, which seem opposed to the agricultural interest, we shall not be considered as acquiescing in the doctrines therein advanced, our sole purpose being to enable our readers to estimate the truth or detect the fallacies of the arguments advanced.—ED. FARMER'S MAGAZINE.]

### THE CENTRAL AGRICULTURAL SOCIETY.

(From the Times.)

We had at first intended to make some remarks upon the proceedings of the agriculturists, as reported in yesterday's *Times*, and on the speech of Earl Stanhope. But really we cannot, and fortunately we need not. With the utmost respect for the landed interest as a mighty and invaluable public body, and with sincere personal esteem for the noble lord who stood forward to represent it on this occasion, it would be impossible for us, consistently with an outward observance of such sentiments, to express our opinions freely with regard to their arguments or their measures. We are *unable* to write seriously about the currency question in connexion with the distresses of agriculture. We have not command of our own muscles, and we have too much pity for those of our neighbours, to undertake a discussion on the subject of "equitable adjustment;" and with those who recommend a reduction of the taxes affecting agriculture, we can hold no logical communion, when they affirm that an *entire abolition of rents* would not make three farthings' difference in the price of the quartern loaf! For all that, we wish heartily well to the landed interest, and would be its advocate even on the present occasion, if we could understand the meaning of the proceedings.

### THE CENTRAL AGRICULTURAL SOCIETY.

(From the Morning Herald.)

The great object which we have long advocated, of a real and searching parliamentary inquiry into the causes of "agricultural distress," with a view to a remedy, now seems as if it could be no longer baffled or evaded. Heretofore the agriculturists were deficient in that union and combination of effort which was absolutely necessary to overcome the obstacles that an adverse government threw in their way, and to defeat the machinations of the Whig political economists, who, with the most heartless inhumanity, have ridiculed the sufferings and mocked the distresses of that most industrious, orderly, loyal, and meritorious portion of his Majesty's subjects, the farmers and yeomen of England.

But union and a common spirit and principle of action are no longer wanting to the agricultural body. The report of a great meeting held yesterday at the Freemasons' Tavern, which appears to-day in another part of our paper, will show that the *point* of combined operations is at last established in the metropolis by the creation of a "Central Agricultural Association for England and Ireland." Let this association be conducted with prudence, intelligence, and uncompromising firmness, and a very different reception will be given to the petitions and demands of the agriculturists in the next session of parliament from that which they experienced in the last.

There was a time when the ministerial journals never adverted to the claims of the agriculturists without making them the subject of stupid ribaldry and unfeeling sneers. It was a common practice with them to call the farmers "clods," and other contemptuous names, and to represent them as an exceedingly ignorant and benighted class, who were "unphilosophical" enough to complain of their distresses, instead of patiently sitting down under them, and deriving consolation from the lessons of political economy. We suspect that the ministerial journals will learn to treat the agriculturists with more respect, and to pay somewhat more of serious attention to their claims, upon finding that the "cause of the British plough" has become the rallying cry of a great association in the metropolis, who will have recourse to every constitutional effort to prevent the government and the legislature from any longer treating that cause with contempt and neglect.

Having advocated the cause of the agriculturists through evil report and through good report for years past, as a cause intimately connected with the interests of the nation at large, we rejoice to observe the public strength which now collects around it, and which, guided, as we trust it will be, by united discretion and energy, cannot fail to discomfit the unpatriotic—the un-English party, who could see the plough rotting in the unfinished furrow—the homesteads of rural industry sinking into ruin—the cultivator of the soil consigned to the gaol or the workhouse, and the beautiful fields of England made desolate, for the benefit of "science," and the advantage of the foreigner!

The real friends of the agriculturists will advise unity of action above all things—it was by such unity that the inhabitants of towns carried the repeal of the house-tax. Therefore did we approve of the advice given by the Marquis of Chandos to the landed interest and the farmers to avoid identifying the question of agricultural distress with the question of the currency. The broadest basis for moving parliament to institute an inquiry into the causes of the distress should be taken. When a committee is granted, then will be the proper time to offer evidence as to the causes. If, as we believe, the Currency Bill is one of the great causes of the low prices of produce under a heavy pressure of taxation, evidence to that effect can be given; or if it can be shown, on the other hand, that the Currency Bill is not one of the causes of agricultural distress, then will the mind of a large portion of society be disabused of an error that in the present state of things, becomes more prevalent every day.

Independently of the currency question, there are many matters worthy the consideration of a parliamentary committee, as connected with the relief, or at least the mitigation, of the distresses of the agriculturists. We alluded the other day to a more equitable arrangement of the land-tax—besides which, the compensation of tithes—the mitigation of

the local burdens of the farmer, consisting of county-rates, &c., and a poor-law for Ireland, ought all to be taken into the account. It is well enough for Mr. Spring Rice, our very superficial Chancellor of the Exchequer, to exhibit the returns of Irish produce exported to this country, as proofs of the prosperity of Ireland. But when we hear periodically of thousands of the Irish population dying of famine in the midst of plenty, we look at those returns as most melancholy evidence of Irish destitution and misery. If the great mass of the Irish population had the means of becoming consumers of their fair proportion of the corn, the bacon, the butter, &c. produced in that country, the markets of this country would not be inundated with Irish corn and other produce. All these matters, as connected with the question of agricultural distress, are proper subjects of inquiry before a committee of parliament, and we hope the "Central Agricultural Association," though confining their efforts, in the first instance, to obtaining a select committee upon agricultural distress, will keep them in view, and be prepared with such information as may be made available to the elucidation of the truth during the progress of a legislative inquiry.

#### THE CENTRAL AGRICULTURAL SOCIETY.

(From the Courier.)

Whatever may become of what is called the agricultural distress, it promises in the mean time, to put an end to the distresses of others. The functionaries who are to manage the Central Institution in London, have, we take it, got into rather snug births; and will most probably get a sleek and comfortable look, notwithstanding the "unexampled depression" of their constituents. That skilful alchymy, by which golden sands are extracted from the waters of bitterness, is no where so well understood as in England; and whether it be true or not, as Mandeville said, that private vices are public benefits, there can be no question that in this happy land public misfortune is always rendered productive of private advantage. However, the agriculturists are their own masters; and if they choose to be good-naturedly fooled out of their money, it is their own affair. We should be glad were any one of the patrons or founders of the new institution to explain what benefit resulted to agriculture, or to any one except its functionaries, from the establishment of the Board of Agriculture. And yet it had Arthur Young for its Secretary—a man who had done ten times more to promote agriculture, and who was incomparably better acquainted with its principles and practices than the whole host of those, though it were multiplied by 50, engaged in the present project. We suspect, however, that the scheme, magnificent as it may at first sight appear, is not destined to be very long lived. Most prosperous landlords will have nothing to do with it, and a brief experience will teach those in a different situation, that the employment of stipendiary "howlers" in London, is more costly than productive.

We should be anxious to promote, to the utmost of our power, any scheme that promised to relieve any part of any distress the agriculturists may really suffer, without compromising the interests of any other class. But it is quite clear that the leaders at the late meeting here, as well as at most of the other meetings in the country, have no such object in view. They do not say a word about any practicable measure of relief. They seem even to have thrown overboard the malt tax. A reduction of the standard, or a modification of what they call Peel's bill, is now

their single, as it always was their sovereign, specific. And though Lord Chandos, at yesterday's meeting, deprecated the introduction of any such topic, it formed the staple of Lord Stanhope and Mr. Cayley's speeches; and appeared to be the only thing about which the meeting cared a straw. We are glad that the Association has thus early manifested its views. Its leaders have fairly thrown off the mask; and we think better of the vast bulk of the agriculturists, who have been truly said to be, *minimeque mule cogitantes*, than to imagine for a moment that they will connect themselves with, or in any way support a junto, who call upon the legislature to benefit them by—robbing every one else! But they will certainly call in vain. Any government inclined to support their views would merit all the worst epithets lavished on O'Connell and the Catholic Priests, and would in a fortnight be trampled under foot. The British nation will never submit that all contracts should be vitiated, and that every individual to whom money is owing, either by the state or by any one else, should be plundered for no better purpose than that some few hundreds of improvident landlords might get a licence to defraud their creditors. This is impossible, so long, at least, as there remains amongst us the smallest respect for justice, or even the baser principle of self-love.

#### THE CENTRAL AGRICULTURAL SOCIETY.

(From the Globe.)

We could wish the career of the "Royal Agricultural Society," which was opened by the yesterday's meeting had been auspicious, were it but by a glimpse or two of that clear intelligence which broke forth at more than one of the local meetings throughout the country.

We could wish to have heard delegates from the Shropshire meeting, where the landowners were advised to come with clean hands into parliament, having previously strengthened their case for legislative assistance by doing all that private justice would dictate in behalf of their tenantry. We could wish to have heard delegates from the West Somerset meeting, where Mr. F. Popham pointed out in one brief sentence the necessity of clearing away that previous illusion which exists both amongst landlords and tenants, and which incapacitates all whom it affects from viewing deliberately the realities of their present situation. "In his opinion," said that gentleman, and the words are deserving of due meditation, "they never would go on well till both landlord and tenant forgot *war-prices*." Let all classes connected with land assure themselves that those are not friends of their future interests, however they may be flatterers of their present persuasions, who encourage them to mistake *recollections* for *hopes*—the feverish flush of prosperity, occasioned by the unprecedented impulse given to agriculture during the war, for a natural or wholesome condition, or one which can be restored by Lord Stanhope's recipe of replenishing the country with *paper*. An artificial currency at home was perhaps an unavoidable incident of a struggle which imposed lavish expenditure abroad, while at the same time it closed the continental ports to those commodities in return for which the precious metals flow into this country. It was, however, one of those imperial remedies of a desperate crisis which would be mortal in habitual use. The sot flies to the brandy-bottle to re-excite his exhausted powers—exhausted by the very stimulant to which he resorts for renewed vigour.

## THE CENTRAL AGRICULTURAL SOCIETY.

(From the Mark Lane Express.)

Sincerely devoted to the interest of the British farmer, we hail with as much satisfaction as he himself can do, the slightest possible prospect of amendment of his present distressed situation. We should, however, deem ourselves highly culpable if, for the purpose of obtaining his momentary approbation, we should either flatter his prejudices, or suffer a delusion to be practised upon him by raising false hopes, and thereby abstracting his attention from those remedies which we firmly believe can alone afford him relief. It is well known that for a long period the advantages which would result to British agriculture from the formation of a "Central Agricultural Society" in the metropolis, have not only been felt but pointed out by us. A "Central Agricultural Society" has been formed, and would to God we could congratulate the *tenant farmers* throughout the kingdom upon the fact. Having some knowledge of the sentiments of those gentlemen who were taking the lead in the organization of this society, and impressed with the belief that the real object was the advancement of their own peculiar views on the currency, we urged, in our last number, the propriety of testing them on this subject, at the meeting of the 15th inst. We did so from a conviction that the agitation of this question would prejudice the cause of the agriculturists, and also from a rumour having reached our ears, that it was the intention of those who were to play the leading part at that meeting, from *prudential motives*, to keep that question in the back ground for the *present*. In this opinion we do not stand alone; the Marquis of Chandos having expressed the same sentiments, and which have been adopted by the Buckinghamshire, and other agricultural associations. The course suggested by us was, however, rendered perfectly unnecessary by the open declaration of those gentlemen who had been previously appointed to move the resolutions. Mr. Spooner, as will be seen from the report, moved the whole of the resolutions, seven in number, *seriatim*, which were all seconded by another gentleman. Earl Stanhope next moved a resolution, which, as it was aptly observed by Mr. Robinson, M. P. for Worcester, "embodied a perfect truism, not only with respect to farmers, but with respect to every class of the community; because it was plain and obvious, that unless a man's means were proportioned to its expenditure, he must be a distressed man." The resolution was to this effect—"That nothing can remove the present overwhelming distress but the adoption of some measure which will either raise the price of produce to the level of the burthens imposed, or bring down the burthens to the level of the present prices." We apprehend no man will dispute the proposition contained in this resolution, taken abstractedly, but the noble Earl has

himself explained the sense in which it was understood by him, and by those who voted with him. Lord Teynham having, in the course of his address to the meeting, been called to order, the Noble Earl observed, that "He wished the Noble Lord who had been called to order to consider that the resolution now before the meeting *related solely and exclusively to the question of the currency*, and that this question ought therefore to form the sole object of his remarks!" The resolution was adopted by the meeting; we must, therefore consider it as the declaration of an intention to press for an alteration of the currency. The Marquis of Chandos urged in powerful language the withdrawal of the resolution, but in vain. We know, however, from personal communication with several persons who were present, that a disinclination to divide the meeting, and thereby weaken the effect intended to be produced, alone prevented an expression of dissent on the currency question, and we feel persuaded that if the Marquis of Chandos had taken one side of the room, and Earl Stanhope the other, the fate of the Noble Earl's motion would have been very different. Upon a careful examination of the speech of Earl Stanhope, in moving the resolution, some strange and startling propositions will be discovered, and a wonderful discrepancy will be observed in the opinions expressed by other noble lords and gentlemen who, if they did not hold up their hands against the resolution, at least did not dissent. His Lordship ascribes the fall of prices entirely to Peel's Bill, and maintains that nothing short of its virtual repeal can raise prices, and relieve the distress of the farmer. Having occasion a short time since to refer to Evans's and Rully's *Farmer's Journal*, we observed a letter dated Dec. 1813, and which appeared in that journal on the 10th January, 1814, entitled, "ON THE RAPID DECLINE IN THE PRICE OF CORN," and in looking through the file for that year we found innumerable communications upon that subject, some of them containing statements of the increased cost of raising agricultural produce at that time, as compared with certain previous periods, and showing the utter impossibility of growing corn at the then prices. Of the truth of these statements we entertain no doubt, knowing that a fall in the price had commenced, and being also aware that rent and expenses never decline as rapidly as the value of produce. Surely it will not be contended that Peel's Bill, passed in 1819, occasioned the distressed condition of the agriculturists in 1813. There are some statements made by his lordship which appear to us not only irreconcilable with facts but with each other. He says, "the resumption of cash payments having greatly contributed to reduce prices, had in a still greater degree contributed to lower wages." Now, we are bold enough to contend, not only that the resumption of cash payments has not affected the value of labour more than any other ar-

ticle, but that taking the country through, where the labourer is paid without recourse being had to the poor fund, the wages of labour have not been reduced in proportion to the price of wheat. His Lordship expresses a degree of kindness for the labourer which we doubt not he sincerely feels, and for which he deserves the highest credit: and after observing that "If the price of wheat rose 10s. per quarter, it undoubtedly followed that the price of bread would rise in a much greater ratio," he goes on to say, "they were bound to the poor cultivators of the soil to take measures to prevent any great increase of prices until a corresponding increase had been made in the price of wages:" and this he proposes to effect by fixing the price of bread; a plan too chimerical, as it seems to us, to deserve notice. Again he says, "It mattered not whether prices were high or low, provided that a proportion between prices and payments were equally sustained." So say we. Such was the opinion of Earl Grey's administration,—such was the opinion of Sir R. Peel's,—and such is the opinion of the present administration. Why, then, does not his Lordship direct his energies to the attainment of an object in which he would be supported by almost the whole body of agriculturists, and aided by the government of the country, rather than waste his strength and mislead those who place confidence in him, by seeking to depreciate the currency, a measure in which he will be resisted by men of all political creeds. And here we would invite attention to the following able remarks of Mr. R. Baker, of Writtle, made at the late meeting of the Chelmsford Agricultural Society, where 332 agriculturists sat down to dinner, and at which the Marquis of Chandos was present; he said—

"I was looking last night at an able report respecting this county, which is not generally known, published by Vancouver in 1795. In that report he gives a description of lands in this district—the average of rent, the aggregate of the composition for tithe, and the amount paid for poor-rate, together with the price paid for wages. He omits nothing of this nature which can throw light upon the matter. Now on referring to this report, I find that the rents of that period averaged 14s 6d an acre—(Hear, hear, and cheers.) The tithe composition was 3s 6d, (Hear) and the poor-rates 4s upon the rack rent. (Hear.) Now what was the situation of the occupiers of that period as compared with those of the present time? I will say that there has been an increase of expenditure on landed property—and also an increase in the expense attending the tithe impropriations: I will give you 25 per cent. for that, which is more than it will bear out. I will add 25 per cent. to all those statements of Vancouver, and I ask you, then, has rent descended to that principle? (Loud cheers and cries of 'No') has the tithe descended to it? (Cheers.) That the poor-rates cannot have done so I know, because with a diminished capital, instead of a diminished poor-rate, we have had a heavily increased charge of this nature. (Hear, hear.) I say, as Mr. Disney said, that I consider the poor-rates in the light of a public charity, and therefore that the public purse ought to support them. I say let them collect that rate in the shape of a public tax, because every one in the State ought to bear his fair share of that impost, which is not the case now. I say, too, that it is the duty of the landlord to reduce his rents to the standard of 1795. (Loud cheering.)

That it is the duty of the tithe impropriator also to reduce his tithes to the same level (*continued cheering*); I say it is the duty of the occupier to reduce his expenditure to the same sum as it stood to that period. (Cheers.) And I say it is the duty of the labourer to reduce his wages to the standard of that period also. When you have tried this, then I say in addition go to Parliament and ask them to give you relief. (Loud cheers.)

The advocacy of relief by reduction of burthens is not confined to the Chelmsford meeting; there were many who dined at the Freemasons Tavern, on Tuesday last, after the formation of the Central Society, who, had they possessed the flow of language which nature has given to some of the most zealous advocates of a depreciated currency, would have given expression to opinions of an opposite character. We wish that every individual deputed by the local associations to attend that meeting had declared his sentiments as boldly as Mr. Wilson, of Allerton Hall, who was deputed from the Leicestershire Agricultural Society. We took a short note of his observations, which, although they may not be literally, will be found substantially correct. They were as follows:—

"After the eloquent address we have just heard, it may appear presumptuous in so humble an individual as myself to offer any remarks, but I feel I should be wanting in that manliness which has been so highly eulogised by the honourable gentleman who has just sat down; I should be wanting in duty to that large and most respectable body of men, who have done me the honour of sending me to represent their opinions on the present occasion, if in paying my tribute of thanks to the gentlemen who have so ably contributed to the formation of this Society, and in expressing my gratification at the splendid eloquence I have heard, in advocating so good a cause, I did not express the regret I feel, a regret which I know will be deeply felt by many in the county from which I come, that that eloquence was almost exclusively confined to the question of the currency. Fearing it should go out to the public at large that this Central Board of Agriculture considered that the only object it had in view—the only means which the Agriculturist had to look for relief, we, gentlemen, conceive that question is more properly the subject of enquiry of Parliament, and in its hands would leave it. There are other subjects, and those of much importance, well fitted to their labours, to which they will pay attention;—such as examining the Fiscal regulations which materially affect the Landed Interest—examining what effect the importation of hides and tallow has upon the Home produce—explaining the Local burdens which press more or less heavily in different districts; such for instance as the County Rate, which in Leicestershire, as appears from late Returns, amounts to 168,330l. 3s. on the land, while 783l. 2s. only is upon Mills and Factories. If this were all, it would be too insignificant to complain of; the same principle affects us more grievously in the Poor Rate,—for instance, in 24 parishes, in one county, containing above 44,000 acres—in a population of 3513, 1121 only are agricultural. I must apologize for intruding so long, but could not refrain from attempting, however feebly, to counteract an impression from going abroad that might be prejudicial to this Society. I must congratulate the Meeting on its establishment this day; I trust it will be countenanced, and its usefulness extended from one end of the kingdom to the other. Let us go on in the good work we have begun. Let us not rest until we have procured that relief which is justly our due, that protection we freely yield to all other classes. Let it be borne in mind we seek none but that

which is in *proportion* to the burdens we bear, and is *consistent* with the welfare and prosperity of all other interests.

Lord Wynford was of opinion that altering "the currency was the first or proximate cause of agricultural distress, yet *he believed that that distress would have ultimately arisen, even although the currency had never been altered.*" Lord Teynham thought that "one cause of agricultural distress was the increased importation of produce from Ireland." It is a remarkable circumstance, that of about 35 members of Parliament who were known to have promised their support before the meeting of Tuesday last took place, 28 voted for Mr. Cayley's motion on the currency in the last session of Parliament.

In making these observations, which may not be in accordance with the sentiments of many of our readers, we are actuated by no other motives than that of preventing grievous disappointment which the *tenant farmers* must feel, if, by the mistaken course of their leaders, the next session should be lost in useless investigation and idle discussion, and at the end of another year they should find themselves in no better situation than they now stand. We say *reduce rents and burthens of every description to the level of prices, and tenants will not complain.*

#### ON THE CONVERSION OF FOREIGN WHEAT IN BOND INTO FLOUR.

(From the Public Ledger.)

In the city article of yesterday's *Times* we find some observations respecting the conversion into flour of the foreign wheat now in bond, on which we deem it necessary to offer a few comments. We should have had more pleasure in recurring to the subject if our contemporary had at once taken what we consider to be the only equitable view of the question, and had given his powerful aid in promotion of the plan suggested; although nothing can be fairer than the manner in which the objections to the proposal are put by him. The *Times* says:—

"The plan which the Government is said to have in contemplation for allowing foreign wheat to be taken out of bond for the purpose of being ground into flour is the subject of much discussion in the corn and flour trades. An argument in favour of the plan has already been made public, and it seems but fair, therefore, to state the reasons which are urged in the trade against it. Their main ground appears to be the gross frauds which would be practicable under it, and the persuasion that the plan could not be carried into effect without detriment to those interests which the corn laws designed to protect.

"There are, it is said, 500,000 quarters of wheat now lying in bond in London which can find no market, and it is therefore proposed, by the supporters of the measure, to get rid of it by converting it into flour and biscuit, expecting that purchasers for exportation will be found for it, releasing thereby the amount of capital now locked up, which could be devoted to other purposes, giving profitable employment to millers and biscuit-bakers, and enabling the supply trade of those articles to be carried on direct from hence with Newfoundland and other places.

"The objectors, in answer to this, say that these anticipations are fallacious, as the continental markets

could not be undersold. The fishery colonies, it is stated, are supplied now, as they have been for many years, from the north of Europe, chiefly from Hamburg. What is there, then, they ask, in the proposed plan, to warrant the expectation that those supplies can be offered on more favourable terms in London than they have hitherto been obtained at Hamburg and elsewhere? To the original cost of the wheat from which the flour and biscuit is to be made must be added, it is argued in continuation, the freight and charges, and the greater expense of making the biscuit here than in Hamburg—about 15 per cent. on the value of the article; all which additional items must be incurred without any advantages to the buyer to counterbalance it. The merchants chiefly connected with Newfoundland despatch their vessels, it is said, from Dorsetshire and Devonshire by the north passage, that they may call at Hamburg, and there take in the requisite supplies; not only biscuit and flour, but beef and pork, which are there obtained at very low prices."

We have so often shown how easily fraud may be guarded against, in carrying out the plan, that it is not worth while to repeat our observations on that point, especially as our contemporary does not go into it on the part of the objectors. It is no begging of the question, therefore, to assume that the conversion and shipment can take place without any fraud on the agriculturists of this country. This being granted, the question of remuneration to the proprietors of bonded wheat, after the grain has been converted into flour, or biscuit, for exportation, is one affecting them. If they see their way clear in obtaining a market, of what value are the opinions of those who think differently? It is the capital of the proposers, and not of the objectors to the plan, that would be risked in the adventure.

But these objections, worthless in application, are not even valid in themselves. In the first place, if it were a question of competition—which it is not—it must be obvious that much time and money would be saved by the importation of wheat, in large quantities, from Danzig, and other places, and then manufacturing it in England for exportation to the colonial fisheries, in the vessels employed in the Newfoundland and neighbouring trade, instead of sending those vessels to Hamburg for their supplies. And this we have on several occasions declared to be the case, without having had our statement impugned in a single instance. We speak with a perfect knowledge of the subject when we again declare, that the merchants connected with the Newfoundland trade in Devonshire, Dorsetshire, and elsewhere, would infinitely prefer the victualling of their vessels at home, if they could use bonded wheat, to despatching them *via* Hamburg; notwithstanding the collateral advantages obtained by their purchasing other stores, besides provisions, at Hamburg, to the general detriment of the English ship-chandler, and the tradesmen from whom he receives his supplies. Are the "objectors" agriculturists? If so, how can they be so blind as not to perceive that, if these vessels took in stores of flour and bread in England, they would complete their victualling of beef, pork, butter, &c., from British produce also? Thus, then, we meet the objections offered, before giving a reason that, if needed, would outweigh all opposition to the proposed plan. Which is, that the holders of bonded wheat have no choice—if the question of competition were really one of any value they have no choice in the matter—for the grain in bond, placed there, much of it four or five years since, at a cost of about a million sterling, is absolutely decaying in the warehouses. It has already deteriorated in value to an immense amount, and if not speedily used will be only fit for swine.

## THE AGRICULTURISTS.

(From the Standard).

When last treating of the agricultural question, we mentioned that the greater breadth of land, which, according to Lord Fitzwilliam's statement, has been laid under grain, is at once a proof and a promoting cause of agricultural distress. It is proof how little the subject is understood, even by the most intelligent, that the *Times* actually uses the fact alleged by Lord Fitzwilliam, and, we believe, truly alleged, as an argument on the other side—

“Yet are there some difficulties to be cleared away upon this question, before we can satisfy ourselves thoroughly as to the truth even of this postulation of the agricultural writers. If farm produce has of late years not fetched remunerating prices, how comes it that, according to Lord Fitzwilliam, a greater breadth of soil has during that period of constantly accumulating complaint been brought under the plough than formerly? They surely will not tell us that the prospect of loss was what induced the farmer to extend his operations over a larger, and therefore (had his complaints and those of his landlord been strictly true) a more losing, surface. If increased cultivation has not been stimulated by a remunerating price, what, we ask, is there which can have caused it?”

The question of the *Times* can be easily answered—*necessity*. The farmer is in a very different position from any other tradesman; he cannot, when profits fail to remunerate, invest his capital in stock for a few months, and retire into ready-furnished lodgings. He has not a capital which eats nothing, and which, if it does not afford some interest, at least makes no demand upon his pocket. The farmer cannot retire from his farm, as the manufacturer may from his manufactory. Whether he cultivate, or do not cultivate, he must pay rent for the land to which he is legally wedded as it were “for better, for worse,” “for richer, for poorer.” He must pay rates, he must pay taxes; he must feed the stock in which the greater part of his capital is invested; he must keep in repair those frail farm buildings and frail instruments of agriculture, which absorb the rest of his capital. Nay, if he will not, by employing them, feed his labourers, in his farm kitchen, or in their own cottages, he must feed them in the workhouse. He cannot hand them over to the manufacturer, as the manufacturer is generally kind enough to hand over his dismissed labourers to the farmer. The mistake of the *Times* consists in supposing that men never toil except for a profit. This, however, is by no means the case. Men are often placed in such unhappy circumstances, that their best hope is not to realize a profit, but to render their loss the least possible; and this is precisely the condition of the English farmers. They have employed the most extraordinary exertions to make good, in quantity of produce, the diminution of its value in the market; and one of the means first employed, with that object, has been to strain the use of their capital to the utmost, by bringing into cultivation, with a view to the market, every acre previously reserved for luxury, or enjoyment, or domestic use; and it is in this way that the breadth of arable land has been increased, and, we believe, in this way only.

It is another proof how little this subject is generally understood, that men actually believe the new Poor Law Bill to be a benefit to the agriculturists. We must, indeed, acquit the *Times*, which has nobly stood forward for the poor, of any participation in this error; but other honest and intelligent writers

have lapsed into it. We are of opinion that the mischief of the Poor Laws' Bill already works against the agriculturists to an extent ill compensated by any diminution of rates; and we are persuaded that if the bill be persevered in, in the spirit in which it has been hitherto applied, sooner or later it will leave the land of England not worth cultivating, even at a bounty. The awfully increasing disproportion between the rich and poor is a prime element in the distress of the agriculturists; and whatever tends to aggravate that disproportion, will infinitely add to the farmer's distress. Adam Smith says, that a fifth of produce added to, or taken from, the market, will diminish prices one-half, or double them, as the case may be. Now, the professed effect of the New Poor Laws in promoting economy among the middle and lower classes, will not be confined to the diminution of one-fifth of consumption, probably not to one-half of the consumption of these classes. We have been informed by an intelligent baker, who has resided for twenty-five years in what may be called an average part of London, whose bread has lost nothing of its excellence, who has had no quarrel with his customers, and no new rival in his neighbourhood that, notwithstanding a considerable increase in the population—notwithstanding the present low prices of all kinds of grain, and the general activity of trade—his business has fallen off full twenty per cent. since the passing of the New Poor Law Bill. The baker in question supplied no parochial establishment; and when questioned how could the New Poor Law affect his business? replied, that many of his customers, and some of them who wore good clothes, too, were so frightened at the prospect of being starved outright in a workhouse-gaol, that they began to half starve themselves at home. Families, he said, of six persons, husband, wife, and children, that used to buy their ten quartern loaves a-week, did not now take five. But this is a view of the subject which we have not room to prosecute to-day; but we earnestly recommend it to the friends of the agriculturists. By bringing down the dietary of the people—by starving two or three millions of their countrymen, the landlords and farmers will starve themselves. It is a melancholy consolation that all these contrivances to widen the disproportion between the rich and poor, will, assuredly, and by an eternal law of nature, lead to a convulsion, in which all property will be swallowed up.

## AGRICULTURAL DISTRESS.

(From the Morning Herald.)

We cannot think that those persons are the real friends to the suffering farmers of England who insist upon the currency question being so mixed up with that of agricultural distress, that the latter ought not to be presented to the consideration of parliament unless in connection with the former. Our own opinions upon the consequences of the alteration in the currency effected by the bill of 1819, have been too often repeated not to be well known. We have seen no reason to change that opinion; but we are equally well convinced that to obtain a favourable hearing in parliament to the claims of the agriculturists, it is necessary that the question of agricultural distress should be placed before the Legislature on its own merits, and not identified with another question, which can only tend to divide the farmers' friends and gave a triumph to their common enemy.

Judging from some of the recent proceedings in agricultural societies at Aylesbury and elsewhere, we are disposed to think that some emissaries of the government have got into those societies, for the purpose of breaking up the strength of the agricultural interests by sowing dissension among them. The Marquis of Chandos has, on more than one occasion, lately advised the advocates of agricultural relief to avoid the fatal error of blending the two questions; for nothing can be more certain than that any such attempt must lead to the failure of the intended application for legislative inquiry and relief. At a recent meeting his lordship expressed his great anxiety that the meeting then assembled, and all others coming in contact with any deputations from associations of other counties, should strictly confine themselves to the question of agricultural distress, and not mix up that question with that of the alteration of the currency. "If the currency question," he emphatically added, "were mixed up with that of agricultural distress, he felt convinced that the consequences would be a total defeat in the House of Commons."

The union of these two questions will, indeed, be the disunion of the friends of the farming interests. We before adverted to the example of this which was afforded by Mr. Cayley's motion of last Session—a motion which, by blending currency and corn, divided the Conservatives, and gave to the unpatriotic enemies of the British plough a decided triumph.

Let, then, the friends of the farming interests profit by experience. Let them rally with a common watch-word round a common banner, and let them not, like the theologians of Antioch, be employed in discussing abstract questions, and refining upon theoretic subtleties, while the battering-ram of the enemy is thundering at the gates.

The noble lord, to whose opinions upon this subject we have already alluded, proposes what we think all reasonable persons must consider the prudent and proper mode of proceeding. He proposes to move for a select committee to inquire into the causes of agricultural distress with a view to a remedy. If that motion be carried, as we have no doubt it will, unless the question of the currency be mixed up with it, then it follows that an opportunity will be given to examine evidence as to the effects which the bill of 1819 may have had in lowering prices, and thereby contributing to bring about the present state of unexampled agricultural distress. If there are other causes they will also be inquired into; and if, upon full and fair investigation, it should unhappily appear that the distress is of such a nature as that parliament cannot give it any effectual relief, at all events the real state of the case will have been demonstrated, and the legislature will have relieved itself from the serious charge of being indifferent to the sufferings and evincing a callous contempt for the prayers of a large and most valuable portion of his Majesty's subjects.

#### THE AGRICULTURISTS.

(From the Norwich Mercury.)

We would especially point the attention of the occupiers of land to the letter signed J. S. which appears in our Journal to-day. We agree with our correspondent in the belief that the most intelligent, and indeed the great majority of the farmers are not so lost to their real interests as to be deluded by the bubble of the currency. Their trade is simply af-

fectured by the two principles—demand and supply; their only protection against the evil they are suffering is an adequate reduction of rent, tithe, and taxes. The other expences, seed-corn, labour, and tradesmen's bills fall with the price of their commodity. Establish the power of growing with a sufficient profit above the outlay—which is only to be done by diminishing the outlay—and the trade will then stand upon the same foundation that all other trades are placed. As it is, they have been and are now the victims of a falsely so called system of protection, yet which they have all along been trained on to expect an average rate which has rarely been reached and, never supported, and to which their expences have been thus screwed up. In this simple but clear and true statement lies the whole question. The wisest men among them see this—and to those who do not, fact and experience have afforded no instruction.

If any journal in the kingdom has a right to the title of the Farmers' Friend, it is our own. We may honestly boast that we have written more and taken more pains to elucidate every question connected with agriculture since 1813 than any other, scarcely excepting those who devote their pages wholly to agricultural reports. We once more then, urge the tenantry to consider what they have gained by committees and delegates from Mr. Webb Hall's abortive association scheme, down to the "agitation" project which is now on foot. In their present depressed circumstances a false light, which has led them on in hopes of relief from extraneous quarters, when the right road lay in an opposite direction. A new species of delusion is just now beginning. The writers of agricultural reports are endeavouring to circulate the belief that from the consumption of wheat in other ways than the subsistence of men, owing to its cheapness, the surplus will be absorbed and prices rise before the next harvest. This may possibly happen, but we rather suspect it is only a part of the same juggle to draw the attention of the farmer from lessening his expences to the hope of higher prices. Let him look to Earl Fitzwilliam's unanswerable statement on this head for an answer to the fallacy. If prices rise, the warehouses will open and foreign grain beat down the price of the home growth. And this effect must always follow, for the instant the high price brings into action the low duty, the supply will exceed the demand. It has been shown a hundred and a hundred times that such must be—observe, *must be*—the inevitable result; and thus it is that protective laws become no protection at all.

The bitterest enemies of the landed interest, and of the farmer more especially, are those who would call off his attention from these truths, and set his mind and money gadding after committees of delegation and inquiry. All inquiry is satisfied by the fact that the kingdom has been supplied, and more than supplied, by its own growth and the growth of Ireland and the Colonies for the last three or four fair seasons. This is the truth, the whole truth, and no self—no effectual relief—can be had but from diminution of rent, tithe, and taxes.

#### THE CENTRAL AGRICULTURAL SOCIETY.

(From the Standard.)

Whatever difference of opinion, and it must be slight if any, can exist, as to the proceedings at the agricultural meeting yesterday, every friend of the British farmer must rejoice that a general association has at length been formed, and that it is determined to press an inquiry upon the legislature.

## TURF INTELLIGENCE.

It is commonly remarked, that racing is a genuine English amusement, and this generally and justly received opinion might have been extended so as to embrace whatever relates to the horse in form and manner; for, although the attention of the breeders of this country has been mainly directed to the saddle and the harness horse, yet our heavy draught horses, though susceptible of great improvement, are superior to those of any other country. It is true, the persevering Bakewell, to whom the English farmer is originally indebted for the present improved state of his stock, committed an unfortunate mistake when he imported the huge Norman marsh horse for the improvement of the Leicestershire breed; it was an error in judgment; which, however, proved his ignorance of the physiology of the animal whose valuable qualities he was anxious to increase. Mr. Bakewell was evidently unacquainted with the nature of the bone, tendon, and muscle of the varieties of the tribe; he was not aware, that, even in regard to mere bulk, to leave solidity out of the question, the leg bone of the thoroughbred was superior to that of the dray horse. We are of opinion, there is not a brewer's horse to be found whose bone below the knee would measure so much as the same part in his Majesty's horse, The Colonel, Mr. Theobald's Laurel, Sir T. Stanley's Battledore, or Mr. Batson's Plenipo. However, we will leave the farmer to the improvement of cattle for heavy draught, while we take a review of the subject more immediately the object of our miscellany.

That like produces like is a generally admitted axiom, the truth of which is borne out by the evidence of facts; thus the Americans evince as ardent an attachment to whatever relates to the horse as their English progenitors; and, although for reasons too obvious to need enumeration in this place, they have not yet equalled the English racer, or brought the various ramifications of the Turf to that degree of perfection which characterizes its various departments in this country, they have made rapid strides in the progress of improvement, and have been successful in producing a sort of horses, which, in that almost everlasting pace, the trot, leaves those of every other country at an immeasurable distance. This perfection in the trot has not been attained so much by the kind of horse used for the purpose, as to the mode of his education; from the time the young animal is handled, he is subjected to this pace, and not being allowed to gallop, the trot becomes so habitual, that if urged to greater speed, he endeavours to increase this pace, but never breaks from it.

Since the peace, which put a period to the most obstinate and bloody war which ever desolated Europe, the intercourse of the natives of England and France has been more cordial, and friendship more sincerely cultivated, than at any former period; and to this circumstance may be attributed that partial or local zest for racing, which has been lately manifested on the other side of the Channel. However, the taste of the two countries is essentially different; and as it has hitherto been found impossible to induce the French to adopt the English style of pursuing the fox, we are of opinion, notwithstanding present appearances, that, should any circumstance transpire to induce the numerous English residents to leave that country, horse racing would entirely fade away.

In the present dull and languid state of racing affairs, owing to the intervention of winter, and other causes which we noticed in our preceding publication, we may at least discuss suggested improvements, if we should not succeed in prevailing upon those more deeply interested in Turf affairs than ourselves to adopt them.

We have repeatedly stated it as our opinion that the racer is brought upon the Turf at too early a period of life; and we may here observe that, owing to the premature exertions to which he becomes thus subjected, he is often driven from it before he has attained maturity—frequently so shattered as to be rendered useless or of trifling value ever afterwards. If what may be called the trading part of the Turf are determined to persevere in this pernicious system, what possible objection can be offered to the provision of good stakes for racers beyond the age of three years? The most important stakes in the country, particularly the Derby, the Oaks, and the Doncaster St. Leger, are specifically appointed for three-year-olds; and the superior competitors in these races, are afterwards excluded from any splendid prizes if we except a few of the Cups, most of which, however, are handicapped, and a superior horse thus deprived of his fair and legitimate pretensions. It may be remarked, that a horse of well-known and acknowledged superiority, would run away with every thing, if some means were not adopted for counteracting his superior powers; but, as these are generally over-rated in the handicap, a grievous punishment is inflicted on a noble animal merely on account of his excellent qualities. Surely a more eligible method might be adopted in the management of these matters than that so commonly resorted to at the present moment. But, above all, why not provide good stakes for horses beyond the age of three years; such a system would not operate injuriously on the present three-year old stakes, but would increase the interest of the race course, and most likely prevent many good horses from retiring so early from the active operations of the Turf. Plenipo and Queen of Trumps,—are they to be broken down by unreasonable weight, or abandon a calling in which they have so pre-eminently distinguished themselves?

THREE PRIZE SOUTH DOWN WETHERS,

BRED BY MR S. GILBERT, STOVENEHUR, NEAR LEWIS.

Exhibited at the Smithfield Show 1835

From an Original Drawing by L. Parker.

## THE PLATE.

MR. S. GRANTHAM'S PRIZE SOUTH-DOWN WETHERS.

These three beautiful sheep, thirty-two months' old, bred by Mr. Grantham, of Stoneham, near Lewes, were exhibited at the Smithfield Show, on the 14th of December last, for which he obtained THREE PRIZES, namely, the first premium of ten sovereigns, as the feeder; a Silver Medal, as the breeder; and the GOLD MEDAL, as being the best pen of South-Down sheep in the exhibition. The beautiful symmetry of the sheep, and the excellence of their breed, was the subject of universal admiration—they were slaughtered by Mr. Giblet, of Bond Street, and weighed, No. 1, twenty-one stone; No. 2, twenty stone six pounds; No. 3, twenty-one stone three pounds—Mr. Grantham's stock is of the very first class, and held in the highest estimation; he has now found it necessary to have a public day for letting, as his tups are eagerly sought after by the first agriculturists in the kingdom; they may be seen from July till the end of September.

### OBSERVATIONS ON THE REPORT OF THE POOR LAW COMMISSIONERS —(CONTINUED.)

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—I left my last observations on the report of the Poor Law Commissioners, at the evidence of the master of Aylesbury work-house, whose evidence it seems respecting old Eritt; and old Hearn was made a strong-hold by the commissioners in justification of the separation of old and infirm married paupers. The commissioners then go on to cite a passage from the report of Mr. Hawley (an assistant commissioner) in favour of their own views on this subject, and which may have been, and undoubtedly it was, quite conclusive to the minds of the commissioners, but I must think they go a little too far in accusing those who happen to differ from them on this principle, of being *ill-informed persons*. People who live in glass houses should certainly discourage the practice of *throwing stones*, instead of being found among the first to adopt this resource, either as a means of defence or recreation.

In my former letter my objections to the proceedings of the commissioners as regarded the workhouse arrangements, related entirely to the treatment of the adult paupers, and as, since I wrote that letter, I have had several opportunities of ascertaining the treatment exercised towards the pauper children in a neighbouring union, and as I have derived unmeasured satisfaction from the arrangements of that department, it would, I feel, be disingenuous on my part if I did not mention the great object attained by the poor law amendment bill, in respect of the moral education of the young, and the decided advantage it derives from a comparison with the former state of things. The work-house to which I now allude was originally built by three adjoining parishes, for their mutual accommodation and benefit, and was regulated under Gilbert's Act, up to the time of the passing of the amendment bill, when the old union was dissolved, and the three parishes became united with about thirty other parishes, and then this house was selected as the receptacle for the infant paupers. Now, during the existence of the abuses of the old poor law system, a circumstance occurred to me connected with the work-house I

have just mentioned, which I shall now relate for the purpose of illustrating the evils of that system, both as regards the neglect of the children, and the extensive means of provision it occasioned for the destitute. In the autumn of 1832 I had an application from the governor of the above work-house, to purchase a horse which I had offered for sale, and the price I asked for the nag was twelve pounds, which his Excellency seemed to think was a little too much money. At that time it happened that I wanted a boy to drive plough, and as I knew he had one among his household that would do for my purpose, I made him the offer that this boy should come and work out the mare. This offer was immediately accepted—my mare went to the work-house, and the work-house boy came every morning to my farm, according to the agreement for three shillings a week, and *this three shillings a week was consequently paid to the governor for the boy's board in addition to three other shillings a week paid by the parish to which the boy belonged*. It is true that in order to avoid this sort of traffic in labour, that the three parishes which belonged to the house had a standing rule, that no labour was to be so supplied to either of the united parishes, but as the parish in which I live did not happen to belong to this union, it did not, of course, come within this restriction. The above is not an isolated instance of the destructive system—hundreds of similar cases at that time of the day were to be met with. But now for the boy himself. He was an illegitimate child, and had been born and bred in this work-house. At that time he was about sixteen years of age. He did not know a letter of the alphabet, neither did he know even a word of the Lord's prayer; he was well fed and determinedly lazy, and I have since ascertained that he was in the habit of amusing my other lads and boys with stories of the most disgusting nature, of occurrences in which he was a party concerned at the work-house; and I do regret, (because I should like to edify the sticklers for a continuance of the old work-house system,) that common morality prevents me more minutely mentioning this poor boy's revolting narratives. Now let us contrast the moral condition of this boy with the children I have lately had the pleasure of seeing at this house. I have on more than one occasion examined them in their religious instructions, and not only do they know the Lord's prayer, of which my poor workhouse boy at the age of fifteen did

not know one word, but on my putting to them the principal and leading questions from the creation of the world, and even to the death of Moses, and the accession of Joshua, I did not fail in any one instance of obtaining a correct and reasonable answer from one or the other of the class, which consisted of about twenty boys, of from ten to thirteen years of age.

It must, however, be quite unnecessary to proceed with this comparison—no reasonable person can doubt for a moment the improvement effected by the amendment bill in this department, and future generations will bless the day when the cultivation of the human mind was extended to the pauper children of the community.

In mentioning the expedient of migrating families of labourers from the southern agricultural districts to the northern manufacturing towns, the commissioners call the attention of the Secretary of State to the steps they have taken to forward this object. These proceedings appear to have been conducted alike with discretion and zeal, and not only have the commissioners fully established the fact, that the manufacturing towns do at this moment furnish a ready market for a considerable additional supply of labour, but from the information they have obtained, and published, they have also excited a spirit of enterprise for this undertaking. The guardians of an union in this part of the world adopted a capital plan in this respect. They selected an active and intelligent labourer from one of the parishes belonging to the union and sent him to Manchester in order to ascertain if there was employment to be found, at what rate of wages, and to inform himself of all matters relating to such an enquiry. The result was, the man returned fully impressed with the conviction that there was plenty of work, and of such a nature that an agricultural labourer would find no difficulty in turning his hand to, and at wages much higher than those paid by the farmers. This man with his family has since gone off to Manchester; some of his friends intend to join him in the spring, and many others are anxious to be afforded the means to make the same experiment, and I have no doubt that this new market for labour will eventually absorb a great portion of the surplus supply of that commodity in the overpopulated agricultural districts.

The successful issue of this attempt is to be attributed to the good management with which it was conducted. Had a cart load of paupers been sent off to Lancashire, and turned out in the High-street of some large manufacturing town to provide work for themselves, without the means of subsisting until work could have been obtained, the probability is, that they would have been speedily reduced to indigence and want, and consequently immediately would have proceeded to beg their way *back to their parish*, where their "tale of woe" would have been sufficient to prevent any others from making a like attempt. After having disposed of the subject of migration to the manufacturing districts, the commissioners mention the more serious undertaking of Foreign or Colonial emigration, on the principle of which they do not seem to entertain a very favourable opinion, and they publish a table which they truly state "displays the very small extent to which parishes have resorted to this provision." Now the commissioners do not mention the circumstance of their refusing all assistance to parishes where the paupers were desirous to emigrate to the United States. I have not the means of knowing how extensively this fact operated to discourage Foreign

emigration, but in a parish which adjoins that in which I live, and which parish I find mentioned in the table I have above alluded to, as having applied to the commissioners for their assistance to send twelve persons to Canada, did, I know, apply for aid to send nearly thirty to New York, but when for this destination the commissioners refused assistance, the paupers themselves, with the exception of twelve,—declined leaving home for an English colony.

The policy of this proceeding on the part of the commissioners, opens a wide field for difference of opinion. For my own part I confess I cannot make the distinction, and it appears to me, if it be *wise* to encourage emigration to Canada, it must be also *right* to facilitate this object to New York, or elsewhere. There may be numerous reasons why the English government should *prefer* emigrants proceeding to one of our own colonies, but if a case should occur, (and such a case did happen in the parish I have mentioned,) by which a number of paupers being refused assistance to emigrate to New York, as the only alternative of such a refusal were to remain at home, I cannot perceive any reason that would justify the accepting such an alternative. I now come to the mention in the report of that part of the amendment bill, on which I have had more difficulty in forming an opinion of my own, than I have had on any subject connected with the principle of this bill. I mean the bastardy clause.

I confess my opinion is entirely with the clause as it originally stood in the bill—before the amendment in the House of Lords—and I should now be glad to see the statutory provisions repealed under which proceedings may be taken by the parish against the putative father. I know, a person holding this opinion, may be much misrepresented, and harshly dealt with, even by amiable and well-disposed people. This is an unpleasant reflection, for however immaterial a matter it may be to differ in opinion with the thoughtful and the ignorant, or to be attacked by the profligate and the vicious, it is nevertheless a matter of deep regret to differ with the enlightened and well-disposed, who persist in regulating their opinions by an amiable theory rather than by stern practical results. What, I ask, has been the effect of the late bastardy laws? Increase of poverty, and increase of crime, and a consequent defalcation of morality and virtue—of continency and honour. Take a single instance of betrayed confidence. Bring before you a ruined and forsaken female, and you *naturally forget the perverted principle which has been mainly the means of her fall*, and call only to your mind the vile and heartless seducer, and the strong and natural question which arises to you is, "is this wretch to escape punishment, and to avoid retribution, and is the betrayed and forsaken to be left in poverty and in misery? Who can reply in the affirmative? On the other hand take a more extended view of the effect of the late legal protection to the weaker sex. Deliberately weigh the fact that seventy-five out of every hundred marriages in the lower walks of life, under this system have been compulsory, arising from fornication; and think on the circumstance that the twenty-five (out of every hundred) forsaken owe their fall from virtue to example, created by, and hope of, getting married, arising out of, the liability of the seducer to support the offspring; and also bear in mind that the seventy-five marriages being *compulsory*, are generally imprudent and unhappy.

Ought not a principle so destructive to be destroy-

ed? Who can reply in the negative? If we allow our feelings of sympathy to protect the weaker and to follow with retribution of this sort the stronger offender, as the means of preventing this prevailing crime, we shall assuredly grasp at the shadow, but if the course is followed to which reason points as the real means of prevention, and which certainly appears to me to be found in the original clause of the bill, we shall truly then deal with the substance of the evil. Cases of hardship will undoubtedly at first appear, instances of depravity and suffering may come within our knowledge, which may for the moment cause us to doubt the justice and wisdom of a proceeding which has been adopted in our minds after the most confirmed reflection; but let the principle be followed, harsh as it may seem—neither looking to the right hand or to the left, and it will be at no protracted date that we shall have the satisfaction of being convinced that we are pursuing the right course, and the instances of evil (which will immediately arise out of the pursuit, to virtue,) and without which no good and moral object can be again attained, will become less and less. In conclusion, of these observations on the above subject, the commissioners add, “it appears to be commonly overlooked in the complaints on this subject, that for the injury of seduction, the courts of law afford a remedy; and to any objection which might be made, that this remedy is too costly, or is otherwise out of the reach of the poor, we submit that the proper remedial course of legislation, would be to render justice, dispensed by proper judicial functionaries, accessible to the poorest classes of the community.” The force and desirableness of this last suggestion, must, I think, be admitted by all. Under existing circumstances it would be an insult to feelings already outraged, to point out to a betrayed and *poor* female the protection a court of law would afford her,—such a protection would be about as accessible to her circumstances, as the shores of Great Britain were accessible to the power of Napoleon Buonaparte, and consequently it would be a most barbarous enactment to remove one tittle of the present liability of the seducer, before a remedy more severe in its nature, but different in form and purpose, was provided for his punishment.

The last paragraph in the report is as follows—“In concluding this our first annual report, we beg to assure your lordship that our labours are sustained by an entire conviction that the act in every main provision, will fulfil the beneficent intentions of the legislature, and will conduce to elevate the moral and social condition of the labouring classes, and promote the welfare of all.” Now, I do hope, and believe, that the “*main provisions*” of the bill can promote beneficent views, and elevate the *moral and social condition of the labourers*,” if they be applied with humanity and discretion. But if these *provisions* be placed in the hands of inconsiderate and unfeeling men, if the *immense power* which this bill confers on those who are selected to administer its purposes, be perverted and abused, either by ignorant or unprincipled officers,—for the effect to the community will be the same whether the perversion arises from ignorance or crime—then indeed may we apprehend the worst of evils to follow. It is true we shall know the quarter to look to for retribution, not to the legislature, but to its servants. And on the other hand if the purpose of the bill succeed, and if it be *hitherto used* it will succeed, then, although the nation will acknowledge the wisdom of the legislature in adopting such means as the occasion required, will nevertheless turn with feelings of gratitude and

pride to those men who from their sagacity and prudence, their honesty and undivided purpose, became the instruments of its successful application. There can be no doubt but that difficulties of an extreme nature will present themselves to all persons in authority under this act, and motives, and conduct, even when regulated by strict humanity and principle, will be misrepresented and traduced, and that restrained vice and compelled industry will be discontented and clamorous under their new circumstances. Let, however, the remedy be pursued, guided by the conviction that no injury can equal that which is perpetrated (either by an individual or a society of individuals) for the purpose of breaking down and subjugating the human mind—or of robbing men of self reverence—or to attempt to bring them to a stand, more in fear of outward authority, than of the awe that would be created by the cultivating of reason and conscience in the soul.

I am Sir, your obedient  
and very humble servant,  
Sussex, Jan. 5. \_\_\_\_\_ AGRICULTOR.

No. X.

#### TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—I have been a constant reader of your valuable publication the Farmer's Magazine, and have read many excellent letters on agricultural distress, but have never been fortunate enough to find one that could point out an efficient remedy for our relief. The one I have just been perusing is signed Q. E. D. That gentleman's letter goes to prove, that it is rent that is a burden to the farmer. I will grant that rent is a burden among the many he has to contend with, yet it is not one of any consequence when compared with labour; it is that in my humble opinion that oppresses us so much. For instance, where I now reside, when wheat was 80s per quarter we paid our labourers 15s per week and they were contented; now wheat is 40s per quarter we pay 12s, and in most cases 13s 6d. How does that agree? we have but a reduction of one-fifth on our greatest outlay, and a reduction of one-half on our greatest produce; we know men must live, and they cannot live on less than 12s as provisions now are, and support a family; yet if things are to continue as they now are we must fail, that is certain. What is then to become of the poor? You may say there are plenty more fools to take your business and support them; that is all very good, but men will not continue to ruin themselves long with their eyes open. For instance, one of my farms consists of eighty acres of heavy land, on which I keep four horses, and pay 18s per acre rent; last year I sowed half with wheat which will produce me more than 200 quarters; 16 acres was clover, and 12 acres canary, and I could show you that I shall notwithstanding this great crop, (for such I believe you will acknowledge it,) lose money. What is the result? I must lay this land down and graze it with sheep, and of course by that means throw four or five men out of employ. Now if this system is adopted throughout England, which I believe you will acknowledge is the most judicious, what a burden of poor we shall have to maintain, and of course the price of wool and mutton must fall, and then we shall lose by feeding this land. If then neither farming or grazing such land answers, what is to be become of it? and as a great part of England consists of heavy land, and of course has

its proportion of poor, they must starve or the extra poor rates be put upon the good soils and thus oppress them. If you think this worthy an answer you will oblige your's respectfully,

A KENTISH FARMER.

### AGRICULTURAL SHOWS.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

If an apology be deemed necessary for my addressing you, I presume I have only to state that I am equally desirous with yourself to see the prosperity of the agricultural interest. In some late numbers of your valuable periodical, I have read very pleasing accounts of shows of agricultural stock, and ploughing matches in different places; and feeling a conviction that exhibitions of this nature have a beneficial influence on agriculture, I beg to propose one question. What are the probable advantages, and what the effects on the agricultural interest have periodical shows of stock, ploughing matches &c.? I am living in a county where we have nothing of the kind, but am anxious to see one established. If you or one of your correspondents would communicate his sentiments in answer to the foregoing question, I should be greatly obliged.

I am, Mr. Editor, your obedient servant,  
A SUBSCRIBER.

Salop, Jan. 9, 1836.

### ON ROT IN SHEEP.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—As your Magazine is taken in the neighbourhood in which I reside, through my recommendation, I naturally feel anxious that you should maintain its reputation, which I consider to be somewhat injured by your injudicious insertion in your last number, of a letter "On Rot in Sheep." The writer of that letter says, "it is surely no longer believed that it is wet or cold which affects the animal." And adds, "I am inclined to believe that the butter-cup is the plant which is the cause of the mischief;" and as a remedy recommends "earth as good for sheep"; and thinks that he lost his sheep in 1833, which he put into a field of old grass, which had been previously watered, in not stocking the field sufficiently; thus by the length of the grass preventing the sheep from getting at the worm casts or other earth." He then very seriously goes on to speak of hogs, and maintains that earth is good for them. The author also recommends earth as necessary for cattle and horses: indeed, it appears with him to be a panacea for all diseases. I wonder he did not go further, and recommend his readers to eat earth, and bring forward, in proof of its efficacy, the case of the natives of New Zealand, who are said to eat earth to prevent the pangs of hunger.

Now, as these remarks may probably mislead the young and inexperienced agriculturist, I beg, as a practical farmer and grazier, to give my opinion of the cause, and to state what I have always found to be a prevention of the rot in sheep. When the autumn is warm, sultry, and rainy, causing a luxuriant and unsubstantial herbage on

wet and low land, sheep fed upon such land will invariably take the rot. From an attentive consideration of every circumstance, it is evident that superabundant moisture of food is the real cause of this disease; and the only preventives are absorbents. The best absorbent is good grass or clover hay, peas, or beans: these I tried with success in the years 1829, 30, and 31, when several of my neighbours lost the greater part of their flocks. And I will venture to say that sheep will remain sound on the wettest land and in the worst of seasons, if taken up at night and fed with good dry food.

I am not surprised at the author losing his sheep after feeding them upon land which had been previously watered. The celebrated Mr. Bakewell was of opinion, that after May-day he could communicate the rot at pleasure by flooding, and afterwards stocking his land with sheep; the flooding and warm weather causing an abundant and unsubstantial herbage. If the butter-cup was the cause of the disease, it would occur every year, whereas it never happens but in a wet and warm season, except on land that has been artificially flooded, or not judiciously laid dry.

I am not going to deny that sheep and other animals will eat earth, but when they do, it shows a depraved appetite, and is a certain proof of the presence of disease, which earth is sure to increase.

If you think the above worthy to appear in your useful Magazine, it is at your service.—I am, Sir, your most obedient servant,  
J. H.

Manor-Farm, Bedfordshire.

No. XIII.

### TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—I threatened you in my last with another infliction,—a few more observations from me upon the subject of legislative measures for the relief of agriculture.

On the propriety of interfering with the currency as one of the means I expressed in my concluding remarks, an opinion that it would be unadvisable. Reflecting still further upon it, I am the more confirmed in that opinion. Some have named those who advocate a change in the currency, "Currency Doctors;" I, however, shall not so term them, but only beg leave to hint that there is a pretty decided impression upon the minds of a very large majority of influential men, that there has already been enough of currency doctoring,—already enough of tampering with that which but few understand at all, and which hardly any are able so to explain as to definitely convey their meaning to others upon the subject. To be sure the meaning of the gentlemen who are now loud in their demands for a change is pretty definitely evident: they would depreciate the currency, thereby hoping in the same proportion to raise the price of agricultural produce. In this, however, I think they would in a very great measure be deceived. They might be transiently gratified by a trifling advance; but a reaction would most likely very shortly take place, and leave them as they were. And no wonder, the demand being an unnatural one, not resulting from the actual wants of the community. But suppose prices were actually raised for a longer period than I deem possible (for they could not be permanently advanced whilst we remain at peace with all the world, as at present), what would be the consequence? In the like pro-

portion that the cost of living would be enhanced, just so much would the cost of manufactured articles be enhanced, which the farmer must buy, (and where would be his gain?) or the manufacturer must fall into distress for want of demand for his goods, hands unemployed, and all the concomitant evils following, which must then return upon the farmer, and perhaps with twofold effect,—prices reduced again to the present rates now complained of, and those prices paid in a depreciated currency!

In short, common sense dictates that the price of any article must be governed by the demand, that demand being caused by the consumption; the article being consumed and more demanded to be also in its turn consumed. The mere creating of more money cannot permanently increase the price,—the mere facility of being able to buy and sell a thing over and over again, and passing it from hand to hand, whether the article be a manufactured one, or meat, or bread, does not consume it; the mouth and wear and tear, must do it, and thus the demand is created. If you make a parcel of rags current in the shape of notes, those who would have them must produce something in exchange for them. Value for value must still be the order of dealing, let whatever be the thing which represents the goods. Increase the medium, the supply of goods being the same, more of that medium must be given to represent the thing passed from one hand to another in the like proportion that you have increased it; decrease it less is necessary accordingly.

I may not have so extensive a vision as these gentlemen, but it appears to me that no good end can possibly be attained either for themselves or any other class of the community by a change, and they are deluding the occupiers, the tenant-farmers, by false hopes which cannot be realized. Rents must and ought to be greatly reduced; it is but fair, it is but honest. It is unworthy of landlords as men to take advantage in times like these of the law-shackled and soil and local attached occupier, and drain every sixpence of capital he possesses from him, and leave him only the poor-house, in which to pine the remains of life away! It may be said that I am too severe upon the landlords, and that how many of them have made large returns to their tenants at their audits? Some of these no doubt have made handsome returns from right motives (and I honour a really humane act let it come from whom it may), but it is not the legitimate mode of sustaining an efficient and respectable tenantry. It is a mode which only deludes to further loss and ultimate ruin. Lower rents at once to what the tenant can afford to pay with things as they are; and then he is unfettered, and will improve the soil he tills, because he will be secure of reaping the benefit thereof; he will then bring forth all the capabilities and energies of himself and his occupancy, and be the just pride of his landlord's estate, as far as an occupier can be, (and he ought not to be less!) an independent tenant.

But I find that I am proceeding, perhaps, at too great a length for your columns; under your indulgence something further in the same strain, arising out of the subject commenced with, I shall trouble you with in another letter. REFLECTOR.

*Strand, Dec. 16, 1835.*

## ON THE CULTIVATION OF THE PARSNIP.

BY COLONEL LE COUTEUR, OF BELLE VUE, JERSEY.

The culture of this admirable root is almost peculiar to the channel islands: it is raised with extreme care in Guernsey and Jersey; the crop in

either being excellent, both for domestic purposes, and for cattle.

For this last purpose it has been cultivated for centuries, being considered the best root for fattening all sorts of cattle, and swine. Draught horses require no oats, if fed daily with twenty pounds weight of parsnips in addition to hay or chaff; and cows with forty pounds weight per day at two feeds, in addition to hay and straw, will yield a beautiful high flavoured butter of a rich yellow colour, even in the depth of winter.

The meat of oxen fattened by them is superior to any other; and that of pigs is peculiarly rich and sweet, swelling to a great size in boiling; they only require to be fairly tried, to obtain general cultivation in suitable soils. Of this it is necessary to speak carefully, as it is almost doubtful, whether parsnips could be grown at all in poor stoney or flinty soils, if shallow, as they absolutely require a deep soil in which to vegetate freely. It is not so absolutely necessary that the soil should be rich as that it should be deep, for by the drill system of husbandry, and placing the manure into the bottom of the furrow, at nine or twelve inches depth, or deeper, if possible, even in poor sandy soil, a beautiful and heavy crop of parsnips have been obtained, where almost no other root would have succeeded.

The ordinary mode of culture, is to prepare the soil by a slight ploughing early in September, to break up the ley. In January or February it is ploughed a second time with a slight plough, followed immediately on the same furrow by a heavy one, which, in some cases, turn eighteen inches of soil. Into the bottom of this deep furrow, stable manure is pushed. The soil is thus as completely stirred as if it had been trenched with a spade.

The seed is then sown broadcast, and well harrowed in. The moment weeds appear, the parsnips are carefully hand-weeded, which operation is repeated twice; but is now becoming exploded as being too expensive; hoeing answering all the purpose, and being infinitely more expeditious, as well as cheaper. It is a peculiar property of this root to shoot down to any depth, to seek for manure; some intelligent farmers having declared, that they have seen them four feet long, and as thick as a man's leg, in rich light soils. The ancient mode of taking them up, by means of a three-pronged fork, singly, was so slow and toilsome, as to deter some from their cultivation; but a new method has lately been introduced, which affords a large saving of time and labour, by means of a plough, with a rather blunt, or worn-out furrow slice, not sharp enough to cut the parsnips, which are thus forced or drawn out of the ground by the mere pressure of the turn furrow against the soil, without being scarcely ever touched or hurt by the plough. The parsnips are then forked out like potatoes, and collected into heaps. Two men, with a plough and a pair of horses, will thus take up half an acre in a day.

It may not be uninteresting to state the result of an experiment which I made in 1833, in order to introduce the drill system of husbandry for parsnips. Half an acre of deep rich loam was pared, and burned, between the 5th and 11th of April; the ashes were then spread over the whole: over one half of the piece of ground five loads of stable manure were added, when the whole piece was ploughed about twelve inches in depth, and was then brought into fine tilth by harrowing and rolling. The seed which had been in moist sand a fortnight, and was just germinating, was then sown in drills, two feet apart. This came up in seven days, some seed that was put in dry, only came up sixteen days later. On the 8th of June, the parsnips in the drills were

thinned out to four inches apart, and were afterwards horse-hoed, with the hoe-plough twice, an hour's work; and a man was two days cutting out the weeds from between the parsnips. During the remarkable drought which ensued, the small parsnips were drawn to thin them out, which thinning produced 307½ pounds, which were given to the cows, then very badly off for grass, which was more like hay than green food, but the parsnips preserved them in full richness of milk and cream. The crop, notwithstanding the drought, produced upwards of thirteen tons the acre. It is worthy of remark, that the part manured with the ashes alone, was as fine as that to which the stable manure had been added to the ashes. Two rows of the Alteringham or cattle carrot were greatly inferior in point of size and produce to the two rows of parsnips on either side of them; there was also this remarkable difference to be observed; the carrots were always infested with weeds, the parsnips not so, owing no doubt to this circumstance. The small divided leaf of the carrot casting no shade, and filling no space, encouraged, as it were, the growth of weeds; whereas, the large spreading leaf of the parsnip, covering the soil, and smothering all other vegetation, destroyed them: hence, also, the parsnip has another advantage over the carrot, as its ample foliage, draws larger nourishment from the dews and atmosphere, which was clearly evinced by their superiority of size and produce. Fresh sea-weed ploughed into the soil is found to answer remarkably well as a manure for parsnips, and they have succeeded very well by being made as Swedish turnips are in the Lothians. They must be housed dry like potatoes; they are the best preparatory crop for wheat.

*London, 4th Jan. 1836.*

### TO THE LANDLORDS AND FARMERS OF GREAT BRITAIN.

Gentlemen,—The meeting of parliament is at hand, and although many meetings have been held, and much has been said both as to the causes and cure of the intolerable distress which has long been pressing the agricultural interest of Great Britain to the earth, I cannot say that any thing very satisfactory as to either point has as yet been brought forward at them. Now it occurs to me that one very evident cause, and indeed the most powerful of all, has been almost totally overlooked, and to this I would now call your attention, as it is one which not only can be remedied, but which parliament is called upon by every tie of justice to see remedied without further delay of an instant. The cause to which I allude is the enormous import of Irish corn, and the cure for it is the enactment of a system of poor laws for that miserable country. No one who considers that Yorkshire, Lancashire, Lanarkshire, and many others of the most populous counties in Great Britain, are principally supplied with grain from Ireland can doubt that this import is the leading cause of the over supply, and of the consequent ruinously low price of every kind of grain. This, I take for granted, will scarcely be denied by any of you, and therefore will not waste time in bringing forward arguments to prove it. That the enactment of a system of poor laws will cure this evil may not be so clear to every one, and therefore I proceed to show how it will have that effect. At the present moment the Irish peasantry scarcely ever taste the corn which they raise, and, under present circumstances, it is manifestly impossible that they ever can do so. Their miserable farms, if they deserve the name, are so rackrented that every bushel of corn must be sold to pay their landlord, and there being

no market but England for their produce, of course it all goes there. This proceeds clearly and solely from the want of a poor law; for, if such law existed, the landlords would no longer have it in their power to exact the present exorbitant rents, which are only got by compelling the peasantry to subsist upon the smallest quantity of the cheapest kind of food that can possibly support life. A poor law would take this power out of their hands, and would assign a portion of the land to those who are the instruments of raising it by the sweat of their brows, a right which is due to them by every law human and divine. For whose benefit, then, is the present system maintained? Why, for the sole and exclusive benefit of the grasping absentee landlords of Ireland. They, and they alone, reap benefit from it, while its consequences are the indescribable misery and starvation of their wretched tenantry and the sacrifice of the interests of the agriculturists of Great Britain. The immediate result of the enactment of a poor law would be an immense falling off in the export of corn from Ireland, and the consequent removal of the glut which now oppresses every market in the kingdom; and be it kept in mind that it would be at the same time an act of such plain and evident justice as well as policy, that scarcely any one, either in or out of parliament, can now be found hardy enough to oppose it.

Besides the lessening of the export of produce which would take place, there are other collateral advantages of immense importance which would result from the measure now advocated. In the first place, it would relieve England from the enormous and daily increasing influx of the Irish people, who are now driven by starvation from their own country, thus increasing the poor rates of England, which are necessarily burdened with their support.

Secondly, it would be, beyond all comparison, the most direct and efficacious means of putting an end to the disturbances of Ireland, which no one, who has ever been there, can doubt are mainly caused by misery and starvation. It is true that the ill-used influence of the priests, instigated by the political agitators, is an active cause of these disturbances; but were the misery of the people relieved the priests would not find their minds as readily disposed to follow their directions. When people are in danger of dying of hunger (and thousands of the Irish peasantry are only saved from this fate by the charity of their almost equally destitute neighbours,) strange thoughts will get into their heads.

Thirdly, were the disturbances in Ireland put down, there is not a doubt that some millions might be saved which are now required to maintain an army of 30,000 men in that country. This again would enable government to make an immense reduction in taxation, and probably be the means of the malt tax being taken off. But I find I am making this letter too long for the columns of a newspaper, and must therefore sum up shortly what I have further to say. This is merely to call upon you earnestly to take the view which I have suggested of the cause and cure of your distress into your serious consideration, and, if you are convinced that it is the true one, to lose not a moment in petitioning parliament on the subject, and instructing your friends there to insist upon its being immediately attended to. Depend upon it more good will be effected by such a line of proceeding than by petitioning for the removal of the malt tax, which no government can grant under the present circumstances of the country without risking a national bankruptcy.

I am, respectfully, gentlemen, your sincere well wisher,  
MERCATOR.

*Berwick-on-Tweed, Jan. 14, 1836.*

**PROPOSALS FOR A REDEMPTION OF TITHES.**

By C. HILLYARD, Esq.

The whole amount paid for the redemption of clerical tithes to be paid to commissioners appointed to receive the same, to be invested in such securities as they may be empowered by act of parliament.

Of course, the sums to be paid for the redemption of tithes must depend on the annual value of the tithes. The mode which I have suggested for ascertaining that value, in my proposed commutation of tithes, would, I am induced to believe, be as just and fair both for the tithe owners and tithe payers as any other that can be devised. The important consideration is, what is to be the price of wheat, which is to govern the price of redemption. Most certainly, it ought to be the average price, which, under the fullest and fairest consideration, may be expected for five or seven years to come. Some may think it would be fair to take it at the average price for the five or seven years past. I do not think this would be quite fair for the landowner; for the situation of this country is now very different from what it was seven years ago. Ireland sends double—or perhaps treble—the quantity of wheat to this country that it formerly did. Immense quantities of fen land, from being effectually drained, now produce most abundant crops of wheat, while they formerly produced only uncertain crops of oats. Much down and common land is now inclosed, and produces wheat. Add to these circumstances, that the system of agriculture is improved; that the land (excepting the very poor soils, the produce of which will not repay the expenses of cultivation), now produces more grain than it formerly did. Under all these considerations, it appears to me, to be quite out of the question to expect, for some years to come, anything approaching to high prices for corn. The present price of wheat would certainly be too low to govern the price for redemption, for land cannot be bought at such corresponding low price of produce; besides which, the present very low price of wheat is, in a great degree, caused by two successive abundant crops; and, when that superabundance shall have ceased, the price must rise. With great diffidence I give my opinion as to what may reasonably be expected to be the average price of wheat for the next five or seven years; but my humble opinion is, that 50s per quarter, little more or less, may reasonably be expected to be the average price.

In my computations for the farm of 200 acres—half arable and half pasture—mentioned in my proposals for a commutation of tithes, I computed the annual value of tithes, with wheat at 7s per bushel, to be 54l 9s 8d; with wheat at 6s 3d per bushel, it would be 48l 12s 9d. The sum to be paid for redemption, at twenty-five year's purchase, would be 1,215l 18s 9d.

Supposing a parish, containing 2,000 acres of land, the whole belonging to one individual, was estimated to be worth (tithe free), to rent the value of four bushels of wheat per acre, at 6s 3d per bushel, which would be 25s; and supposing that 1,500 were arable, and 500 acres pasture, the annual claim for tithes on such land would be 44l 9s; that would be 4s 5½d. per acre. The amount for purchasing the redemption would be 11,111l 5s (5l 11s 1½d per acre), which amount, if invested in securities to bring in four per cent., would produce for the incumbent of the living an income of 444l 9s per annum—say 400l. The landowner's nominal income from such a farm would be 2,055l 11s; but deducting the common average out-goings, for repairs of buildings &c., it cannot be estimated at more than about 1,900l per annum; so

that the living would be between one-fourth and one-fifth of the net rental of the parish. The incumbent of such a living would surely have no reason to complain of such an arrangement for the redemption of the tithes. I am aware that some individual land-owners and occupiers of land will probably object to persons inspecting their land for the purpose of estimating the fair rent for it; but such objections ought to be no obstacle to prevent the accomplishment of so great a national good as the Commutation, or Redemption of Tithes. The value of the tithes of all descriptions of land ought to be estimated by the value of the produce which can be raised from it, by common husbandry; that value ought also to govern the estimation of rent; on which basis they should form their estimate as to the equivalent to be given for commutation or redemption. They should not be influenced in their valuation by any existing rents. If an individual chooses to let his land at less rent than it is worth, that is no reason why the tithe claimant should have less than the fair value of the tithes. Or, should an occupier of Land, on account of convenience of occupation, or any other cause, give a higher rent than the land is actually worth, that is no reason that he, or his landlord, should pay more than the fair value of the tithes. If tithe payers and receivers choose to go on under amicable agreements, they should not be compelled by the act to break up such agreements; but tithes should not be permitted to be taken in kind after the time specified in the act.

The many great public benefits that must arise from a fair Commutation, or Redemption, of Tithes, are so well known, that it is quite unnecessary to dilate on them.

I have made out four different accounts of the quantities and value of the different kinds of produce to be obtained from farms of 200 acres each, of different soils and value; also, all items of expenses of cultivation; but, as such lengthened accounts would be uninteresting to many to whom I intend sending this, I will only give a summary of my calculations.

No. 1.—Statement of the effect of an abatement of two-thirds of the rent of a very poor clay land farm of 200 acres—150 arable and 50 pasture—(if tithe free), at 14s per acre, with the average prices of corn reduced as follows—wheat, from 56s per quarter to 40s; barley, from 30s to 22s; beans, from 32s to 26s; oats, from 20s to 15s; with meat reduced to the corresponding low price of corn.

Value of produce at the higher prices . . . . .	£703 6	Value at the lower price . . . . .	£515 3
Expences, 380l 6s; rates and interests of capital, 70l; rent, 140l.	590 6	Expenses, 308l. 10s; rates, &c. 57l; rent, 46l. 13s . . . . .	412 3

Occupier's income, with full rent . . . . .	£113 0	Income with one-third rent . . .	£103 0
Rent should be, with wheat at 50s per quarter . .	£125	Tithes—according to my proposals—2s 2½d per acre . . . . .	£22 4s.

No. 2.—200 acres of clay land, at 25s per acre—180 arable and 20 pasture—with an abatement, for low prices, of two-thirds of the rent.

Value of the produce, with the higher prices . . . . .	£900	Ditto with the lower . . . . .	£659 10
Expenses, 470l; rent, 250l . . . . .	720	Ditto—expenses, 388l. 10s; rent, 84l . . . . .	472 10
Occupier's income, with full rent . . .	£180	Ditto—with only one-third of rent	£187 0

With wheat at 50s per quarter, the rent should be 220l per annum.

If titheable, should be 4s 2½d per acre—41l. 16s per annum.

No. 3.—200 acres of good turnip land—180 arable and 20 pasture—at 35s per acre: rent reduced one half, in consequence of low prices. Six-course system.

Value of produce with the higher price	£1102	Ditto with the lower	£810
Expenses, 430l; rates and interest, 95l; rent, 350l	875	Expenses and rates, 439; rent, 175l	614
Occupier's income	£227	Occupier's income	£196

Fair rent, with wheat at 50s per qr, would be £300  
If titheable, 6s per acre ..... £60

No. 4.—The same 200 acres, at 30s per acre, with wheat at 50s per quarter, and other grain in proportion. Four-course system.

Value of the produce	£1053 9	If titheable, Commutation 60l per ann.; one-fifth of the rent.
Expenses, 497l 9s; rent, 300l	797 9	Redemption should—if 25 years' purchase be thought fair—be 1,500l.
Occupier's income	£256 0	

I am quite aware that no statements of produce, and expenses of farming, can be made applicable to all parts of the kingdom. The above have been submitted to some intelligent farmers of this county, who have pronounced them to be, in their judgement, quite fair.

In making out these statements of all the in-comings and out-goings of these different farms, I have had these objects in view: to show to those who know little of rural affairs, that it is not in the power of landlords, as many persons suppose it is, to compensate tenants for very low prices of corn, by abatements of rents:—to show to the advocates for a free trade in corn, that it is quite impossible for the occupiers of land to obtain a decent maintenance for themselves and families, and to maintain the poor of their parish, with such low prices of corn as there must be with an unrestricted importation of foreign corn:—to show the proportion of the value of the produce of the land for the commutation of tithes, and the proportion of the value of the land which I propose to be given for the redemption of tithes. Lastly, I wish strongly to impress on the minds of young farmers about to enter on farming on their own account, that they must not expect anything approaching to the prosperous farming times of 25 years ago; that a decent maintenance is the utmost that can reasonably be expected, and that only to be obtained by industry, frugality, and a constant attention to their business.

Amongst the many national advantages to be obtained by a commutation, or redemption of tithes, there would be this. There is a great deal of inferior old pasture land, with very bad herbage, that would, were it not for the extra demand made for tithes, repay the expenses of ploughing up and taking two crops off it, well cleaning it, liming it, draining it if needed, and then sowing—say three parts of it—down again with grasses suited to the soil; thus finding additional employment for the poor of the parish, and thus enabling the occupiers to keep as much stock, or more, on three parts of their farms, as they had formerly done on the whole.

C. HILLYARD,

President of the Northamptonshire Farming and Grazing Society.

Thorpelands, near Northampton, May 13, 1835.

P. S.—Tithe valuers perhaps, ought to have oaths administered to them that they have not or will not accept any fee. Clergyman ought to be accommodated with a few acres of land to keep a cow, &c.

CENTRAL AGRICULTURAL SOCIETY.

At the meetings of the Society which took place on Monday and Tuesday, the 11th and 12th instant, the following address to the King was read and unanimously adopted, and it was resolved that it should be signed by Earl Stanhope, as Chairman. On the part of the meeting, his lordship was requested to present the same in person to his Majesty:—

TO THE KING'S MOST EXCELLENT MAJESTY.

SIRE—The Central Agricultural Society of Great Britain and Ireland, recently formed in the metropolis of the empire, for the protection and encouragement of agriculture, venture to approach your Majesty with profound sentiments of loyalty to your Royal Person, of unswerving fidelity to the Throne on which it has pleased Divine Providence to place your Majesty, and of devoted attachment to the constitution, of which the landed interest has ever been prominent as the most strenuous supporters in times of popular commotion or of national distress.

It is with feelings, Sire, of the deepest regret and most serious apprehension, that we announce to your Majesty the alarming and almost intolerable depression under which the agricultural interest of this great kingdom is now suffering,—alter twenty years of peace, an enforcement of rigid economy, and a repeal of taxes to the amount of many millions. Thousands of industrious families have been hurled, by no fault of their own, from comparative affluence into utter destitution; capital has been rapidly absorbed without a prospect of remuneration, and many of our ancient yeomanry have been compelled to seek, in distant climes, that support which their intelligence, their industry, and their good conduct ought to have procured for them in their native land.

We presume not, Sire, to indicate the causes which have produced such melancholy and fearful results; we acknowledge, with grateful humility, that the Giver of all Good has been bounteous to us far beyond our deserts, in granting to us abundant harvests, peace abroad, and tranquility at home; and we are fully persuaded that there has been no want of prudence, industry, or skill on the part of the agriculturists, to merit the deep distress with which they have been so long afflicted.

But, Sire, we should be deficient in duty to our country and to ourselves, we should depart from our much valued national character, were we to sit down quiescent under the effects of new but false principles of legislation, and make no efforts to remove either present difficulties, or to avert impending dangers, particularly when we feel assured, that the Legislature has the power of granting us relief. We seek no exclusive advantages over our fellow subjects,—we desire to see agriculture, manufactures, and commerce go hand in hand, for on the prosperity of all three depends, the welfare of our social state, and on their firm union is based the peace and the integrity of the kingdom.

Neither, Sire, have we any political party, or selfish objects in view,—they are alien to our nature,—they are hostile to our interests,—and diametrically opposed to the well being of the community whose relief we seek; and it would ill-become any class of Your Majesty's subjects to approach the seat of truth, of honour, and of impartiality, for the sake of obtaining any objects which are not conducive to the weal and happiness of the nation.

It is therefore, Sire, with renewed protestations of loyalty, that we avail ourselves of one of the many advantages of our free and hallowed constitution, which permits us to approach the throne in respectful supplication as Petitioners for relief of the distress now

oppressing Your Majesty's faithful subjects. We are fully aware of the restraints which the wisdom of our ancestors devised for the limitation of the prerogative of the Crown, and while reverencing such wisdom, we are equally disposed to uphold and maintain the power so judiciously vested in the Sovereign, for instructing his Ministers to inquire into justly alleged grievances.

We therefore, Sir, most humbly pray, that Your Majesty will no longer suffer the most important interest of the state to be neglected, as it has hitherto been, but that Your Majesty will graciously be pleased to recommend to Parliament to take into its immediate deliberation the causes of the grievous distress which now overwhelms the agricultural interest, with a view to provide speedy and effectual redress.

And, as in duty bound, Your Majesty's Petitioners will ever pray.

By order of the Society,  
(Signed) STANHOPE,  
Chairman.

The following Petition to the House of Commons, as prepared by the Sub-committee, was also read and unanimously adopted; and it was resolved that Mr. Bennet should be requested to present it to the House of Commons, as early as possible after the assembling of Parliament; and that Mr. Wodehouse, Mr. Cayley, Sir Charles Broke Vere, Sir E. W. Wilmot, Mr. Ormsby Gore, and Mr. Sheldon, &c. be requested to support the same.

To the Honourable the COMMONS\* of the United Kingdom of Great Britain and Ireland, in Parliament assembled:

The humble Petition of the CENTRAL AGRICULTURAL SOCIETY OF GREAT BRITAIN AND IRELAND;

Sheweth,—

That your Petitioners view, with extreme regret and anxiety, the severe and almost intolerable distress which now afflicts all the Agricultural classes, and which appears to have arisen mainly from legislative measures, and not from causes which are beyond the control of Parliament.

That the distress of those classes will, by its continuance, disable them from bearing their present burthens, and thus render impossible the collection of the revenue, and ultimately lead to national bankruptcy.

That discontent, which is the natural and necessary consequence of severe distress, endangers and threatens to destroy all our existing institutions, and to plunge the country into anarchy and revolution.

That your Petitioners are not influenced by any party views, or by any selfish considerations, and claim only that redress which is justly due, which is required by the interests of all other classes, and which is essentially necessary to the prosperity and safety of the whole community.

That the interests of the retail dealers, and of a large and important class of manufacturers throughout the country, are inseparably connected with those of the agricultural classes, of whom the consumption and expenditure are very materially reduced by a continuance of the present distress.

That the present distress very much affects also the interests of the fundholders, as it will ultimately render precarious, and, perhaps, impossible, the payment of the dividends.

That the labouring classes, for whose welfare it is the bounden duty of Parliament to provide, suffer the most grievous distress when deprived of work, through the inability of the owners and occupiers of land to employ as many labourers as are requisite for its due cultivation, and that the continuance of their employment is rendered very precarious by the rapid reduction of agricultural capital.

That the agricultural classes have endured their severe and unmerited sufferings, in the hope, which has

been hitherto disappointed, and which past experience almost forbids them to form, that Parliament would redress their grievances.

That the patience which they have hitherto shown has its limits, which it cannot be expected to exceed, and your Petitioners contemplate with awe, and with alarm, the situation in which this country would be placed, if a convulsion should ensue, and all the bonds which unite the community should be dissolved.

That your Petitioners are entitled to expect that the sufferings of the agricultural classes will receive the immediate and impartial consideration of Parliament, with reference to all the causes from which their distress has arisen; and your Petitioners are fully of opinion, that nothing can remove the present overwhelming distress, but the adoption of some measure which will either raise the price of produce to the level of the burthens imposed, or bring down their burthens to the level of the present prices.

That the distress and discontent of the country are such that relief cannot be delayed without the most imminent danger.

That your Petitioners consider the redress of grievances to be one of the first and most important duties of Parliament, and most earnestly pray that Parliament will forthwith adopt measures to grant speedy and effectual redress to the agricultural classes of the community, and thus to restore the country to its former prosperity.

And your Petitioners, as in duty bound, will ever pray.

By order of the Society,  
STANHOPE,  
Chairman.

### COMPARATIVE TABLE OF SPEED.

From *The Physical and Chemical Journal of Science, and the Arts of Husbandry in France* we make the following extract, which will be found no less curious than useful, and cannot fail to interest our readers:—

	Feet per second.
The ordinary rate of a man walking . . . . .	4
— Of a good horse in harness . . . . .	12
(Or 2,000 toises (yards) in 8 minutes.)	
— Of a reindeer in a sledge, on the ice . . . . .	26
— Of an English racehorse . . . . .	43
— Of a hare . . . . .	88
— Of a man casting a stone with all his force . . . . .	60*
— Of a good sailing ship . . . . .	19
— Of the wind . . . . .	82
— Of sound . . . . .	1,038
— Of a cannon-shot (24-pounder) . . . . .	1,300
— Of the air which returns into space so divided . . . . .	1,300

EXTRAORDINARY PIG.— For some time past considerable curiosity has been excited by a pig, the property of Robert Edger, Esq. of Shotton Cottage, in the county of Durham, which, without having been fed in any but the ordinary manner, had attained such a growth as to become quite a matter of curiosity to the surrounding country. The animal was of the prick-eared breed, and was killed last week; and although only 13 months old, had attained the surprising weight of 41 stones 3lbs. Its length from the insertion of the ears to the end of the tail was 6 feet 3 inches, and its girth 85 inches; and although of such unwieldy dimensions, its symmetrical proportions were admired by numerous acknowledged judges.

\* We believe this calculation to be incorrect. A stone cast with the strength of a man's arm will outstrip a hare.

\* A similar Petition will be presented to the Lords.

## ON THE STATE AND PROSPECTS OF AGRICULTURE.

TO THE EDITOR OF THE GLOBE.

Gloucestershire, Jan. 9, 1836.

SIR,—You have, on several occasions, inserted my observations upon subjects of great importance: the state of agriculture at the present time, and its future prospects, now demand attention. Previous to the meeting of parliament, the debates of which generally engross your columns, I now forward to you the following reflections, which I hope may be found to contain words of truth and soberness, for I always hold the opinion that those who overstate a case are certainly its enemies, perhaps its worst, unless their audience be void of discernment.

Much has been said upon agricultural distress, and many the remedies proposed: your columns would be unfairly trespassed on by any complete detail of the merits and fallacies of the various prescriptions; but if you will permit me the privilege of occupying at this time a moderate space, I will endeavour to drop a few sparks of information upon subjects which but need them to ignite and diffuse a beneficial and cheering warmth over our industrious and most important agricultural population.

First, then—Let the legislature, as I have ever held it to be its bounden duty to do, carry out into full effect what is called the curse of the Almighty, and secure to our people, who will generally as a consequence be loyal, the opportunity of fulfilling the beneficent decree of our God—"In the sweat of thy face shalt thou eat bread." Inattention to this most important and economical principle by the government of our land—I refer to no particular dates—has, without the formality of expressing it, inflicted upon a large portion of our people one of the worst sources of evil, and what may be denominated the curse of man—idleness. We have also combined, through the same inattention, which I consider criminal, two descriptions of idleness: one arising from foolish giving of money, the other from the inhuman withholding of the means of living by honest industry. I support my first position by the county of Sussex, the second by the kingdom of Ireland, the land blessed by Heaven with matchless fertility! cursed by man with unexampled misery!! Is there no such word as *responsibility*?

On these momentous questions, affecting the daily happiness of millions, our favoured land has by a noble effort opened one eye, and seen the *smaller* evil. Let England now resound from shore to shore with a cry to which every class and every party may respond, "Secure employment to Ireland, bodily as well as mental, and peace will follow in its train."

I will not enter on the question whether man has an inherent and abstract right to employment by the nation, but I will state what is of far more importance—he has unquestionably a *practical* right, with the power to enforce it, which he will exercise: that power, however, is the commission of crimes of such extent and degree that civilised society stands aghast at the bare contemplation of them. Viewed in all its endurance, I think the forbearance of Ireland has been wonderful: with English ideas it is difficult to realise the distresses which the Irish Commission on the state of the poor proves.

As a British farmer, then, I ask, first, for the principle of the 43d of Elizabeth for Ireland. Let not her untaxed, and, by rebellion, her untithed produce also, come into competition with our hard-earned crops. I seek not tithes for Ireland, or exclusion of her produce: in name united, in comfort, in employment, and in consequent plenty and peace, let

her also be compactly joined; but her non-payment of tithes is an additional power of injuring the British farmer. Can this not be seen, with its cruel aggravation?

Commutation of tithe for England stands next upon the list. Lord Althorp's principle of commuting is a most beneficial one; if tithes exist, a commutation proportionate to rent for land is the least injurious principle to cultivation; and cultivation is the mother of employment, with the various blessings it entails.

Our own blessed and bounteous harvests have lowered prices of grain almost without precedent. Wisdom would store part of this abundance for time of need, but confidence on this subject is destroyed. It is not clear that the present corn laws are relied on; they are, however, suitable to the fears of the people, and work well, if not unexceptionable in principle.

With currency what have farmers, as a class, to do? I have the highest respect for Lord Western. Before the passing of Sir Robert Peel's bill I was aware of its power over price, I am still aware of it. I believe the previous departure from the double standard to be an aggravation of the bill of 1819; but these acts have been long done. A metallic standard is, however, good, and change again is evil anew; remedies must on this head, be found in *economising* currency; a good system of banking, and *confidence* between man and man, based upon sobriety, will accomplish this. With good and sound cement, and careful building, our narrowed base, with the irrepressible energy of Englishmen, will accomplish much. The course pursued has enabled us to reduce some of the interest of the debt—it has kept our credit at a premium, even to a Quixotic standard—it has kept us probably at peace, the first of blessings—but it has unquestionably deranged most sadly many of the older contracts between man and man, which equity, could it separate them, ought to repair, and which demand private consideration.

Still this is a question which pervades every class; which is not confined to one. I cannot shut my eyes to the activity of our manufactures, or to the price of wool; the agricultural interest have no strength to spare to urge the rights of the productive classes at large—let them, therefore, concentrate their strength, not to demand inquiry, *which we have very recently had*, but, in the first place—poor rates to secure employment for Ireland.

Your obedient servant,  
GEORGE WEBB HALL.

The Duchess of Kent has sent the following answer to an application made for patronizing the Isle of Thanet Agricultural Association:—"Ramsgate, Jan. 7, 1836.—Sir, I have received and laid before the Duchess of Kent your note of this date, relative to the formation of an Agricultural Association in the Isle of Thanet, for the encouragement of servants and labourers. Her Royal Highness very readily accedes to the desire expressed that she should be the patroness of it, as such requests are always most congenial to her feelings. Her Royal Highness is happy to close her visit to the island by being associated with the gentlemen and farmers in establishing so useful a society, and one so calculated to carry information, zeal, and reward, among those valuable members of the community, the farm-servants and labourers. Her Royal Highness will give every year a prize of 5*l.* to that labourer who shall be considered to have brought up most creditably and usefully the largest family, without receiving parochial relief. Her Royal Highness has directed Messrs. Austen and Co. to pay annually to the treasurer, the sum I have just named.—JOHN CONROY.—Directed to "Thomas Mayhew, Esq., Nether-court."

## ON THE MANAGEMENT OF NEW LEYS.

(To the Editor of the Irish Farmer's and Gardener's Magazine.)

SIR—As I have remarked through many parts of the country much mismanagement in the laying down and treatment of new leys, I beg leave to offer, through your pages, a few observations on this branch of husbandry, so important towards insuring a profitable rotation of crops, in every respect judiciously managed; on the contrary most detrimental to the interests of Agriculture, if conducted in a slovenly manner.

New leys may be considered under two heads,—viz.—permanent, and temporary: the former to remain as long as they can be continued in a profitable turf; the other, as a temporary relief to the land after an exhausting corn crop, and to be ploughed up as soon as this object is effected. This I am satisfied every experienced agriculturist is acquainted with; but it seems there are differences of opinion as to the best mode of laying down land with seeds—some asserting they should be sown with, and others without a corn crop. This no doubt, is a matter that would be highly satisfactory to ascertain, and having made many experiments on both modes, I shall submit them to your readers in order further to elucidate this subject.

Many years ago I observed that grass seed succeeded best where the corn crop was light, and still better in places where there was no corn sown at the same time, and this induced me the following year, to lay down an acre on land prepared for barley, without corn, and the remainder of the same field in the usual manner. The hayseed and barley were sown in the middle of April, and on the acre of seeds there was excellent feeding for sheep in July, which continued in profit till the end of October. On the other part of the field there was a good crop of barley, and the seeds hit tolerably well, but the bite for sheep during the autumn was of little value. On the following spring I observed that the surface of the former was covered as closely as if it was a two year old ley, but where the barley had grown there were many misses and the plants weak, and when mown the following June, did not produce more than one half of hay in proportion to the single acre as stated. This naturally induced me to make a calculation—how such a system would be beneficial generally. I therefore practised it for several years afterwards on a small scale, and found the result equally favourable. No doubt there was a loss sustained by the non-production of corn, but I consider this was fully repaid by the first year's feeding, and the extra hay produced the following year, allowing for the expenses saved of seed corn, sowing, reaping, &c. and sending the grain to market. But the great advantage of this system was proved in the succeeding years, for the grass was much more abundant, and the crops produced when the land was broken up, were much more profitable where this system was practised, than on land where corn and grass seeds had been sown at the same time. Another corroborative proof of what I have advanced occurred the other day. On observing a field of grass land studded with hay cocks, while the adjoining ones had the appearance only of ordinary produce, I asked the farmer who owned the property what caused the great quantity of produce on that particular field. His reply was—that the field had been *worn out*, and “that he was afraid to put corn in, as he was sure he would have a bad crop,” and he added,

“that he laid it down two years ago with grass seeds only.” I am satisfied there were five tons an acre of good hay on the field in question!

With respect to this system being followed with advantage when permanent leys are necessary I have no doubt; but adopt it in temporary leys it may not be altogether so judicious, except in cases where the land is too poor to expect a remunerating corn crop, when it may be beneficially sown either with red or white clover. It has however been asserted, that the corn is a protection to young seeds; but this I have proved to be otherwise; and I recollect well in the dry spring of 1833, I laid down 20 acres of land in Worcestershire with spring wheat, and seeds of different sorts, and I uniformly observed, that in all places where the corn failed, or was thin, both the clover and grass seeds grew freely; but where the wheat was luxuriant, a great proportion of the grasses failed. This evidently shows that the power of the sun and a free circulation of air promote vegetation even in the most tender plants. The free growth of the grass seeds when sown without as a crop, I attribute to the open and pulverized state of the soil during its early vegetation: on the contrary, when overpowered by a corn crop it lies nearly inactive in the ground, during the growth and maturing of the corn crop, at the expiration of which time the land becomes so consolidated, and sometimes foul, that the tender plant of the grasses can scarcely find nutriment: besides, the soil must be materially exhausted by producing the corn crop. It often happens also, that seeds fail entirely from being smothered by a rank crop of corn, or that this latter crop suffers from the luxuriance of the red clover coming up through it; therefore one or the other is often partly sacrificed, especially in a wet harvest. These are, therefore, matters worthy of consideration, which I hope some other of your correspondents will take the trouble still further to elucidate.

The next matter worthy of attention is—what is the most advantageous way of converting new leys to profit? Should they be mown or fed the first year—and what stock is most appropriate for this purpose? Reason and Judgment, I think, will at once decide on this question—feed with sheep the first year in order to thicken the grass, sweeten the herbage, and improve the quality of the soil, for this is the period to effect this improvement, and not when the land becomes consolidated after being mown, and carting off all the substance it is capable of producing. It may be argued, however, that by mowing the first crop a quantity of hay seed is distributed on the land, which would supply the deficiencies from the failure of grass seeds at the first sowing. To this I reply, that if such failure should occur, it would be a far better mode to harrow the surface in spring—sow some fresh seeds, and then roll the surface; for it cannot be expected that seeds falling on a hard soil in the heat of summer, can have a fair chance to vegetate, except in a most favourable season. I am, Sir, however, well aware how reluctant the generality of farmers are to forego a crop of corn, and how difficult it is to persuade them that a green crop will pay them much better in many cases, taking all matters into consideration.

Let us then see how this matter stands. An acre of new ley (a full crop,) would feed 20 sheep in six months—that is, it should turn off two lots of ten each. Supposing those to average 8s a head profit, which is a moderate calculation, the land will pay 8l an acre, and be so much improved that the following year it will cut one-third more hay than had it been mown the first season; whereas, if cut the first year, there would follow but a light crop of after-

grass, and the second year a much inferior meadow, and the land would be much deteriorated by such mismanagement. These observations are equally applicable to red clover leys, which should not be cut unless the land on which they are produced is in good heart; and in no case is it advisable to mow the second crop unless for seed, for it seldom turns out good food for cattle, and the land is much impoverished by the practice.

With respect to cutting the first crop of red clover for hay or soiling, the best farmers are satisfied that the land is as much improved by producing a smothering crop as it would be by being fed with sheep, and this has been proved on a variety of soils. The second growth, however, has seldom this fertilizing property, as it neither throws off its leaves so abundantly, nor is the heat so late in the season sufficient to cause their decomposition or fermentation on the surface, as is the case in the first crop. It however requires good management to feed off red clover by sheep, for if not well kept down when in a succulent state, it will start into seed—the stems grow hard, and little beneficial to any sort of stock. It is therefore judicious to turn in a heavy stock of sheep at the commencement, and should those not be sufficient, to check too great a luxuriance of growth, a few heifers or horses will be necessary to effect this. The field may be divided by hurdles into three or four divisions, and the sheep and cattle changed occasionally in such a manner as will economise the keep, and more effectually improve the land.

Either red or white clover leys should be ploughed up the second year after sowing for wheat, or if not in sufficient condition for this crop, oats may be substituted the following March. It is not advisable to allow it to remain a third year without ploughing, as their roots, which are the chief part of the manure obtained by the introduction of the crop, become too dry for this purpose, nor will they usually produce more than half the quantity of green food after the second year. I have found the American cow grass to do well for a few years, but as a preparation for wheat it does not appear to possess any advantages over the biennial red clover.

I never have experienced any advantage in sowing white (Dutch) clover in preference to red for a temporary ley, except being a better feeding grass, or when the land became tired of the latter sort, in consequence of sowing it oftener on the same land than every 7 or 8 years. The crop however should be managed in the same manner as red clover as a ley for wheat, but it is more profitable to feed than to cut the crop, as it is not productive for hay, or so valuable as red clover. Both those grasses afford an early bite, and may be pastured in April if not intended for meadow, provided the land be dry, but the flock should not be permitted to remain longer than after the top grass being eaten off, or no injury to the crop is likely to follow.

#### AGRICOLA.

ANIMAL WEATHER-GLASS.—In Germany there are now to be found, in many country houses, an amusing application of Zoological knowledge for the purpose of prognosticating the weather. Two frogs are kept in a glass jar about eighteen inches in height, and six inches in diameter, with the depth of three or four inches of water at the bottom, and a small ladder reaching to the top of the jar. On the approach of dry weather the frogs mount the ladder; but when wet weather is expected they descend into the water. These animals are of a bright green.

## BET-ROOT SUGAR, AND GREAT INCREASE OF ITS MANUFACTURE IN FRANCE.

“The manufactories of beetroot sugar, almost totally neglected for several years after the peace, were set to work gradually. In 1820 there were no more than fifty-seven of them throughout France. At that period, however, the process of extraction from beetroot had not been brought to such perfection as to enable the sugar produced by it to compete with the colonial article; but in the course of time that process has undergone so great an improvement, that within the last five years the sugar made out of beetroot has become in every respect equal to that of colonial origin, so as not to be at all distinguishable from colonial sugar. The cultivation of the beetroot has, therefore, almost suddenly acquired a very considerable extent in France, and the manufacturing establishments have so rapidly increased, that they now number no less than 407. These yielded, in 1834, 30,000,000 kilogrammes of loaf sugar, a quantity sufficient for the wants of one-half of the population of the country. It is expected that their produce for 1835 will amount to 40,000,000 kilogrammes. The price of the article in the retail shops is 1 fr. (10d) the pound, for which reason, as you may imagine, it is much more generally in request than colonial sugar, although the competition has necessarily brought down the price of the latter very considerably. The manufacturer of beetroot sugar however, just now derives the larger portion of his profit from exportation. He has found the laws made for the benefit of the refiner of colonial sugar just as applicable to his own, so that without having like the colonial importer, to pay the enormous duty of 50 francs for every 100 kilogrammes of the raw material, or any duty at all besides the land tax in the cultivation of beetroot, which is comparatively trifling, he is entitled to the drawback which the law intended to benefit the refiner of the colonial produce only. People in France will care little whether the sugar they use is extracted from a cane or a beetroot, provided it answers their purpose equally, and they find the one description as cheap as the other. It no longer is a question to enable the country to supply itself with the article, in case it be again prevented from drawing its supplies from a distant colony. The object now is of a much more permanent importance to the various interests of the country. The owner of land not fit for the cultivation of corn or any of the other more essential necessities of life, devotes that land to the cultivation of beetroot, which prospers on an indifferent soil as well as, if not better, than in the best. The capitalist may lay out his funds in the working of a sugar manufactory, and the merchant may speculate in the exportation of beetroot sugar as he did in that of colonial origin. The planter alone may find reason to complain, but, at all events, he will not be ruined. And after all, why should the mother country remain dependent entirely upon him? Has he not gathered riches for centuries past at her expense? And does he not do his utmost to bully Europe into a perpetuation of that revolting system of slavery which has too long disgraced his meridian of Christendom, by threatening her repeatedly with an entire cessation of colonial supplies, should the detestable system which he looks upon as the source of his own prosperity, be put an end to? I dare say that with you in England it is not likely that the sugar trade will have to undergo any change. You cannot afford space for the cultivation of beetroot, and you would much rather be dependent on

your colonies, so long as you have any of your own, for your supplies of their native produce, than on the continent of Europe. But it is easy to foresee that elsewhere the beetroot system will speedily become exceedingly prevalent. Every country of the continent that can afford to do what France does in this respect (and I know of none that cannot) will set about imitating her example, so that in the space of a few years I should not wonder if there be as great a revolution in the sugar system of the world as was operated in navigation by the power of steam."

[The above is from a Correspondent of *The Times*, at Paris. How it is that we, in England, have hitherto been so careless of the cultivation of this valuable esculent, we know not, save and except that at the time our ingenious neighbours were first promulgating the success of their experiments in sugar extraction from the root, our arable lands could not well have been more profitably devoted than they then were to the production of corn. Added to this, the experiments themselves, although successful in some respects at first, yet in others, failed of that perfect result, at which, after twenty years of assiduous attention, they have now arrived. Such being the case, and the evidence of the practicability, as well as certain profit of the manufacturer being completely established, we are curious to know, now that wheat is less than 5s. a bushel, and that (saving the assertion of *The Times'* Correspondent) we have vast tracts of land, still in a state of uncultivation, why it is that no ingenious chemist of this country, or practical manufacturer from France, has not set our Farmers more extensively to the production of beetroot, than its present almost exclusive applicability to cattle fodder had warranted. Prompt, as we have heretofore been, almost to a fault, in copying the elegancies, nay the frivolities, of French civilization—it appears strange, indeed, that the beetroot, which among our neighbours now finds its way in its chemical derivative, to the table of the peer as well as the peasant—it appears strange, we say, that this vegetable should not be more cultivated among a "nation of shopkeepers," where the solid advantages of utility have been almost invariably first consulted, in preference to the refinements of taste. The great extent of our arable fields, at present yielding little or no profit to the occupier—the spirited enterprise for rail-roads, which, when they get *in train*, will be quickly throwing out of cultivation the lands which now supply provender for horses—the varied uses to which the root may be assigned upon the failure of the new one—all conspire to render the cultivation of beet, upon a grand scale, a matter of the first attention among our agriculturists. They know full well that, applied even as they now apply it, it is a most valuable article of consumption; but when they come to read the above, and ascertain the extraordinary capabilities it possesses, under the good guidance of science, in a country, too, not proverbial, certainly, for its farming developments, they must be indeed of a class with the rustic, who stood still on the bank till the river might flow by—if they do not soon vary with beet their growth of corn, and invite, from one of the 400 establishments now in France, some skilful artisans, to set a new manufactory of sugar speedily on foot in this country. We should imagine, at the present juncture, nothing more acceptable could accrue to our rent-ridden tenants, in the way of raising their drooping spirits, than a wholesale call for beet—an article of such easy culture—of such sure returns—and of such indifferent favouritism to soil.—*Taunton Courier*.]

## TO THE LANDOWNERS OF GREAT BRITAIN.

(From the *Morning Herald*.)

Permit me, without preface or apology, to state to you that which all your agricultural meetings appear to require—the specific cause of the depressed price of grain, and its remedy.

That the resumption of cash payments—or, in other words, the enactment to destroy the moral faith of man with man, called Peel's Bill—has been the main cause of reducing the value of everything below its merits, except fixed money incomes, is now matter of undisputed fact.

Inexperienced in the practice and concerns of life, and encouraged by the authority of a statesman professing himself a "Stern Path of Duty Man," but certainly never a vigorous one, metallic currency was based upon the ruins of many an excellent and virtuous banking establishment, and the circulating medium of the country was annihilated, because the vicious operation of a few of them had alarmed the timidity of my Lord Liverpool. The woful experience of thousands attests the truth of this. I do not take upon me to say whatever I may think of a return to that state of currency from which we have departed, but I have no diffidence in asserting that that Bill first reduced wheat to its present price—and the Government of the country, or its agent, the Bank of England, keeps it there. You cannot be a stranger to the course of this establishment, or if you are, I can vouch to you as a truth, it has been continually at work in its vocation to keep down the price of corn. The merchants in that trade have had their credit wantonly impeached by this compound of power and folly, who in the plenitude thereof, avowed that they stigmatized the trade by rejecting the bills of exchange of two of the most notoriously opulent of its merchants, that the trade in corn might be repressed. Their efforts were eminently successful; they broke the spirit and wounded the independence of its merchants, and the commodity, under the persecution, was given up to panic and to sacrifice. The sapient body, to stay the consequences of their acts, promulgated their willingness to advance loans of money to farmers on their corn-rieks, which when applied for, were generally, if not totally, refused. Of myself, I can state to you that I was solicited by one of the branch agents of this establishment to apply to them for a loan of money on a stock of corn in granary, and with personal security in addition; I did so, and the answer to my application for 20,000*l.*, given by the then Governor, "Samuel Drewe," in 1829, was, "Were he to lend money to a corn merchant, the people might think hardly of them for enhancing the price of corn." This was the avowed object of their offer, and they only shrank from the responsibility when the means of attaining that object were pointed out to them, and when they were put to the test. They professed to wish it done, but they dared not do it. The trade thus discredited the bills of its first merchants; rejected by the Bank of England, the example was followed by every petty Bank in every town, and a general prohibition against dealing in corn was established. Deprived of the aid of middle men, to whom the very health of the price of corn belongs, the whole of the agricultural produce of the kingdom has been, according to the necessities of the producers, sold to the consumers at whatever price it would bring—depression has increased depression, until the coarse meal of oats has been sold at a higher price per stone than the finest wheaten flour.

Corn has ceased to be an article of speculation, and it will, in all probability, continue to be so, until defective crops, or a bad harvest, compel it to be otherwise. Nor will it affect this view of the subject, to know that barley and oats have, under the same circumstances, borne high relative prices. They will not do so this year; neither are they grain so subject to be speculated in as wheat, both of them lose in quantity; and barley (when kept) ceases to be of use for malting, its most valuable purpose.

These remarks show that we are now, exclusive of

that which may be in the possession of the agriculturists, without any stock of wheat in granary.

We have no reserve in case of deficiency, and no recourse but in an importation.

We should always have a large stock of corn, and, if possible, of our own growth.

The present Corn Law induces speculations in foreign in preference to British corn, its graduating duties affording the two-fold temptation of an advance in price, and a reduction of duty.

This law should be abolished, and a fixed duty instituted; and if that were 20s per quarter on wheat, and in proportion for other grain, it would be gladly paid by the foreigner for the privilege afforded him.

Let the Government of the country give such encouragement to the trade in corn as it gives to all other trades. Let it be left to the prudence or interests of its merchants to absorb the cheap abundance, for the less abundant and dearer time, fear not their cupidity, the subject is too comprehensive to admit of monopoly, and certain gain is too desirable to allow it to be retained to the injury of the commonweal. Let Government, in the true principles of free trade, forbear to interfere with the honourable proceedings of the community, and they will not only save themselves, the country, and you, its landholders, from anxiety and loss, but promote the welfare of the most important part of the population, without diminishing the comforts or the resources of the rest.

Dec. 21.

A CORN MERCHANT.

## STATE OF AGRICULTURE.

(From the *Edinburgh Weekly Chronicle*.)

Some writers have puzzled themselves in the endeavour to account for the cheapness of corn, but it is simply owing to abundance, and the abundance to the recent improvements in agriculture here and in Ireland. No species of production can be the object of long continued attention, without ways and means being discovered of increasing the supply, and diminishing the cost of production, and consequently the exchangeable value. And it would have been strange, if, while improvements were daily taking place in every department of arts and manufactures, agriculture alone had remained stationary, the amount of its produce as low, and its price as high.

The truth is, great and gratifying as have been the improvements in manufactures, they do not, perhaps, greatly exceed those which have, during the last ten or fifteen years, been introduced into agricultural operations. It is only about twenty years since the first steam-engine was erected in East Lothian for thrashing grain, an example which for some years was followed by few, but during the last eight or ten years they have rapidly increased, and we know for certain, that there are now upwards of sixty in the county. Judging from present appearances, there will not in five years hence be a farm in the county of the extent of 150 acres and upwards, and destitute of water-power, without its steam-engine.

In East Lothian—we speak chiefly of East Lothian, because better acquainted with its concerns than those of other counties; but agriculture is every where rapidly progressing—tile or furrow draining is but an introduction of yesterday, and already thousands of acres have undergone this admirable improvement. So lately as the summer of 1832, furrow-draining was, we believe for the first time, practised in East Lothian, and in one field only. The field in question had been previously thoroughly cross-drained, lime and manure had been poured into it with a liberal hand, but all without avail. At length drains were put into every other furrow, and immediately two pickles grew where but one would

grow before; the first crop repaid the whole expenses incurred. On the same farm 100 acres, or all that requires it, have since been furrow-drained, partly with stones and partly with tiles. On another farm, with which we happen to be acquainted, 200 acres have been tile drained, partly in every alternate furrow, the two intervening ridges being thrown into one, and partly in every furrow, during the summers 1833, 34, and 35; and on a third, 100 acres have been similarly dealt with, during the two last summers. We have ascertained that there are upwards of three millions of dram tiles at present annually manufactured in the county; and yet the tile-works in existence occasionally find it impossible to supply the demand, and others are about to be erected. Three millions of tiles are sufficient to drain 2,000 acres, putting a drain in every alternate furrow.

It is now about ten years since rape-cake was brought under the notice of agriculturists in this part of the country, and it has been for some years in extensive use. One agriculturist, we know, who manures the whole of his fallows with it, at an annual expense of 600*l*. Some hold that it is useful for one crop only, and affirm that it bears the same relation to common stable dung as a manure, that a dram does to a beefsteak as articles of human subsistence. The agriculturist in question, however, who speaks from experience, thinks differently, and is of opinion that rape-cake has added three or four shillings to the value of land situated at a distance from towns where it is difficult to obtain a sufficient supply of manure. As another proof of the intelligent readiness with which everything likely to prove an improvement is adopted, we may instance Chevalier barley, which, though only introduced three or four years ago, was last year almost the only variety cultivated in East Lothian.

These facts are sufficient to show that, amidst other improvements, agriculture has not been standing still. And as improvements in manufacturing machinery have led to a fall in the prices of manufactures, so to improved modes of agriculture are we indebted for the blessing of plenty at present enjoyed by the country. And we conceive they may also be received as proofs that agriculture, in the extensive meaning of the term, so far from being in a backward and depressed condition, is really thriving beyond all former precedent. Individual landlords and tenants are no doubt suffering, but not because agriculture is not in a promising state; but because of arrangements entered into years ago, in the expectation that the high prices caused by temporary circumstances would be permanent. It would be no more reasonable to say that the cotton manufactures are in a drooping state, because the price of cotton goods has fallen, than that agriculture is in distress, because agricultural produce fetches less in the market than it did some years ago. When cotton fell in price, those who happened to have large stocks in hand, or to have contracted for supplies before the fall, no doubt suffered loss—many were perhaps brought to ruin; but it did not follow that the cotton manufacturers were, as a body, engulfed in destruction. Nor because individual farmers, with old leases on their hands, cannot fulfil their contracts with the present prices, can it fairly be agreed that agriculture is in distress. The capital which is so ungrudgingly expended in agricultural improvements, and the energy and ability displayed by agriculturists, is a symptom the reverse of discouraging with respect to the condition and prospects of agriculture. When the price of every commodity has fallen so greatly, landlords cannot expect to receive the same nominal rents as when the prices of every

article of consumption were from one-third to one-half higher.

Those who are most diligent in the improvement of their estates will, as formerly, receive the highest rents. It will not do for them to imitate the lazy Lawrences of the south, who walk about with their hands in their pockets, and then complain of want. But it is from the south that the cry of agricultural distress has chiefly proceeded; that is, from those who resolutely adhere to the imperfect and expensive custom of their forefathers, and refuse to adopt the most self-evident improvements—who still continue to employ from three to five horses at one plough, and thrash their grain with a couple of sticks cut from the nearest plantation. It is ridiculous to hear such men complaining of distress. A spendthrift may as reasonably complain of empty pockets, or a drunkard of the effects of his dram-drinking.

### FRENCH AGRICULTURE.

M. Duchatel in addressing the Council of Agriculture, Manufactures, and Commerce, stated as follows:

"You have assembled in the midst of the most favourable circumstances. Never was the state of the country more prosperous; agriculture suffers it is true from the effect of the low prices of grain, but this suffering emanates from causes, with which the laws have no power to combat, and which will continue to operate even amidst the most brilliant prosperity. Notwithstanding this transient depression, agriculture continues to progress, and at no period more rapidly, every day new systems are being developed, and implements improved; it possesses abundant sources of riches, and the produce of the beet root is beginning to dispute in quality the sugar of the tropical regions.

Government has encouraged by every effort the establishment of agricultural institutions, communicating to the agriculturists a spirit of emulation and advancement which they too often require, (or which too often fails them.)"

He then alludes to manufactures, instancing that the beauty of the manufactures, and the improvements in producing them speak the progress they have made. He then commences referring to the rail roads, by saying, "the iron railways are the most brilliant creation of genius of our age, and strongly recommends their adoption as beneficial to agriculture, to manufactures, and commerce." (This part of his speech forms a curious contrast with the reasons assigned by the Prussian Government forbidding their formation, or that of companies favouring their progress; and the contemplated railroad from Berlin to Potsdam is consequently prohibited.)—M. Duchatel concludes thus:—"The most efficacious means of augmenting the power of labour, is instruction. Since 1830, the attention of the Government has been directed towards its dissemination among all classes of society; but the general establishments of public instruction, are they sufficient for all wants? are there not institutions specially founded to promote the interest of agriculture, and likewise certain branches of industry? it is thus, that we already have veterinary schools, and schools of art and trade; what new protection then can be given to agricultural instruction? is there room to create in some of our grand centres of manufacture schools of industry? In order to form an assemblage of knowledge and information on these subjects so deserving of interest, I cannot better forward such designs, than by addressing myself to an assembly, where the wants of agriculture and industry are appreciated with so much wisdom.

"You are aware that a commission composed of great parts of the members of the council of agriculture has been commanded by the king to prepare the basis of a *Code rural*." I have consulted respecting the principal questions with the general councils of the departments. The council of agriculture will doubtless not

fail in comprehending this important matter within the circle of its labours." After which the general council separated to nominate each their president. The order of the day on their re-assembling is, the consideration of the question respecting railroads.

### SMITHFIELD MARKET.

(From a Correspondent.)

A very serious controversy has arisen, calculated to furnish employment for the gentlemen of the long robe, between the corporation of the City of London and certain salesmen in Smithfield market, who have determined in consequence of the inadequate and shameful accommodation provided for the stock sent to Smithfield for sale, to resist the demands made by the corporation on tolls and pennage on that portion of the city property contiguous to Smithfield, which is called *the improvement to the market*, in which place the salesmen are obliged to stand ankle deep in mud and water, to say nothing of the wretched state in which their sheep are kept during the greater part of the night and following day, till sold, after having travelled many miles without rest. On this improvement, as they call it, it is quite evident the corporation has no legal authority to hold a market, or to exact pennage, or tolls, and that all sales effected there are illegal, as regards both buyers and sellers, who are liable to prosecution.

The following opinion given by Mr. Serjeant Shepherd, the Recorder, and the Common Serjeant appears quite conclusive on this subject, and on this authority the salesmen have determined to abide:—

"We are of opinion that the corporation have no legal authority to make use of their lately-purchased freehold estate, by way of extension or enlargement of the present Smithfield market, no toll can be legally demanded or taken on such extended market place, nor will a sale there operate as a sale in market, overt. The market is granted to the city to be held in Smithfield; and the law is most clearly laid down in the case of Weyhill-market, reported in 3 Mod. Rep. 108, and in a very moderate decision of Curwen v. Salheld, that where the place in which the market is to be held is limited, the market cannot be held out of that boundary. In case such an enlargement of the charter market should be made by the city, it would be an usurpation on the crown, for which they would be answerable on an information of quo warranto, in which judgment of removal of such usurped franchise would be given against them, and they would be fined at the discretion of the court for such usurpation."

It is of great importance to the public that all such arbitrary claims as those above alluded to, with many others demanded by the corporation, alike injurious to the trade and commerce of the city of London should be set at rest, and it is greatly to be desired that the Municipal Reform Bill, may amply provide the means of getting rid of such an injurious impost, as well as relieving the public from such an abominable nuisance as Smithfield market now is, to the metropolis generally.

Since 1828 the manufacture of sugar in France from beetroot has very considerably increased; at the above period there were only 58 manufactories, while at present there are 497. In less than seven years the native produce of the article has increased from four millions of kilogrammes (each kilog, being equal to about 2lbs. 3oz. English), to 30 millions of kilogs, and may be calculated at the termination of 1835 at equal to 40 millions of kilogs.

His Majesty has become Patron of the East Sussex Association for the encouragement of industrious labourers, and also of the West Sussex Association, agricultural and an annual subscriber of 20l. to each.

ARRIVALS of GRAIN into the Port of LONDON for the last FIVE YEARS, during the three months ending 31st Dec. in each year.

EXAMPLE IS BETTER THAN PRECEPT.

Mr. Editor,—Earl Spencer has set a noble example to other noble Earls, and the friends of agriculture in general. Allow me, through the medium of your valuable pages, to direct the attention of your numerous readers to the following statement:—"Earl Spencer bestows annually at Althorp, a prize of £12 to the best hedge-cutter who shall cut, lay, and ditch, in the most workman-like manner, eleven yards of hedge row. It was contended for by sixty hedge-cutters of Northamptonshire and other counties; and after due examination the prize was awarded to Ptolemy Davenport!"

Mr. Fidler and his company at Rowle, are capital bankers; there are some very superior hedgers, ditchers, and Bankers, at Etehillampton and Potterne; the same may be said of some of the Horton and Bishops Cannings natives. You know, Mr. Editor, it was from Bishops Cannings, originally, we derived our charter as Wiltshire moon-rakers. Perhaps the Wiltshire and other Agricultural Societies may think proper to take this subject into their serious consideration.—I remain, Sir, yours, with respect,

A MEMBER OF THE WILTSHIRE COMMITTEE.

ENTOMOLOGICAL SOCIETY.—The ordinary meeting of this society was held on Monday evening, at its rooms in Old Bond-street, the Rev. F. W. Hope, F.R.S., President, in the chair. A communication from Mr. Raddon, respecting the natural history and habits of the turnip-fly, was read by the secretary, which was accompanied by specimens of the larvæ and pupæ. The larva is a small black caterpillar, having six legs, of about an eighth of an inch in length, being extremely active and hopping about with great agility, so as to render it extremely difficult to catch. Towards the end of the summer it enters the earth, and there undergoes the change of form, coming out of the pupa or beetle. When finely powdered lime was sprinkled over the turnips, the insect evaded it by getting under the leaves, whilst a solution of sulphate of potash so strong as to destroy vegetation, had no effect in arresting its ravages. It appeared that where the manure had been ploughed into the ground, immediately on its being placed in the field, the fly is found to abound; but that where the manure is placed on the ground in the autumn, and allowed to remain for a month or two before it is ploughed in, there are scarcely any flies seen. The best essay on the habits of the insect, and the readiest and cheapest mode of preventing its ravages, is the subject of a prize to be given by the Society in the course of the present session.

## HORSEMANSHIP.

## THE STIRRUP.

It has already been shown that the stirrup is of the most essential service; and as I differ in opinion from all preceding writers respecting its general utility, I shall, before I proceed further, give the reasons upon which I maintain my doctrine, produce those in opposition to it, and thus enable the reader to draw his own conclusions or decide for himself.

Those who have given their opinions to the world were military and manège horsemen, and the language they hold respecting the stirrup is this, that "*it should be of that length so that the weight of the foot only rests in it; the foot placed no further in the stirrup than the ball; and that the stirrup conduces not in the least to the safety of the rider.*" Many years have elapsed since I first perused, with much surprise, the maxims here laid down. Of their incorrectness I have been perfectly convinced by very considerable practical experience, which has mainly influenced me in publishing the observations contained in the present essay.

The ancients would appear not to have been acquainted with the use of the stirrup; at least if an opinion is to be formed by the statues which have reached the present times. Yet, I am inclined to think, that if they were unacquainted with the stirrup, they made use of some substitute; but, as antiquarian research is not called for in this place, I shall proceed to the more immediate object in view. The Turks, the Persians, the Arabs, the Cosacs, and, indeed, all barbarous nations where the horse is found, make use of the stirrup; and, in opposition to our professed riding-masters, use it short. I am not pointing out the mode of riding just noticed as a pattern of imitation; I mention it to show that these barbarous people, directed by ease and convenience, find the short stirrup answer these purposes better than the long stirrup. Let it, however, not be supposed that I am an advocate for a *very short* stirrup; as the old proverb says, there should be reason in all things; the middle course will generally be found the best; I advocate neither the *very long*, nor the *very short*, stirrup; but that precise length which I have found most consistent with ease and safety, from many years' experience, as well as from numberless practical experiments, made for the purpose of ascertaining the point in question.

According to the instruction of the riding masters, the foot should be placed in the stirrups as far as the ball, or roots of the toes. The bearing of which should be merely the weight of the foot, or less if possible; we are then told something about the muscles of the thighs grasping the saddle, or operating to secure the seat by the firmness of their hold, the riding masters forgetting, that, by the extension or elongation of the muscles caused by the weight of the lower extremities, they

are utterly deprived of the power of contraction, which can alone enable them to have any hold of the saddle. Let any person who feels interested in the business, ride a horse over a leap (or *jump*, according to modern phraseology) having the stirrup of that length so that the ball of the foot merely rests in it; if the rider has a good balance, and the jump merely mechanical, as at the bar, for instance, he will get over without a fall; but, let the same person then shorten the stirrups one inch, or half an inch, and repeat the jump, he will find that his seat is not only more pleasant, and more firm, but by thus bearing more weight in the stirrup, the muscles contract, and enable him to sit so close to the horse as to appear of one piece. Further, should there be any hesitation on the part of the horse, or any thing awry in the jump, he will still maintain his seat, which, under such circumstances, would be almost impossible with the long stirrup.

The *learned professors* thus express themselves:—"the knees must be stretched down and kept back, which will occasion the rider to sit on his fork or twist; the legs are to hang near the horse's side, but not to touch; the heel is to be sunk as low as possible, and the toe raised. *This will give firmness and strength to the muscles of the legs and thighs!*" I have lived many years in the world; I have read much; but I never recollect any thing more absurd having fallen under my notice. In the first place, it may be observed, that, resting the weight of the body on the "*fork or twist*" cannot well fail to produce rupture in many instances; and hence we see the cause which has, at times, thinned the ranks of our cavalry, and which it is endeavoured, at this moment to counteract with belts, &c. Further, when the thighs and legs are stretched down, the heels sunk as low as possible, and the toes raised, how is it possible that the muscles of the legs and thighs can acquire firmness and strength, when, by being thus stretched out, they altogether lose their compressive force!

The fact is, that the stirrup, without being unreasonably short, should be of that length that will enable the rider to sit with his knee a little raised, thus giving him in reality "*firmness and strength in the muscles of his legs and thighs,*" while he is fundamentally supported by the bearing of his foot in the stirrup.

I never saw a single instance of a huntsman or whipper-in riding with long stirrups, and they are continually placed in situations where the strength of their seat is tried. — Goossy, huntsman to the Duke of Rutland, rides with remarkably short stirrups, as did his predecessor, Shaw, one of the best riders across a country I ever saw. Sebright, who some years since hunted the Quorndon pack, is at present huntsman to Lord Fitzwilliam, rides as well as Shaw, and, like him, uses short stirrups. Similar remarks will apply to Richards, Payne, Shirley, Head, and many

other huntsmen whose performances I have witnessed.

On the race course a firm, strong, and steady seat is indispensably necessary—but who ever saw a jockey ride in long stirrups, and his heels sunk as low as possible?

Consequently, if long stirrups are utterly inconsistent with riding after hounds, on the race course, and in all critical and trying situations, they cannot be advisable for the road, or, indeed, for any useful purpose, under any circumstances.

The stirrup should be of that precise length by which the rider will perceive that he can accomplish the firmest grasp with his knees and the calves of his legs, without loosening the thighs from the saddle. The foot home in the stirrup, and placed horizontally, that is, the heel not sunk lower than the toe.

As to the idea entertained by timid and bad horsemen of the danger of placing the foot home in the stirrup, it is quite unfounded. The seat will be much firmer with the foot home; and, in order to dispel all kind of apprehension, in case of a fall, of the foot becoming entangled, let the drop or spring stirrup be used, and the spring bar at the saddle also, articles which may be procured at any saddler's shop, and a glance at which will convey a much more correct idea to the mind, than can be accomplished in several pages of description. I cannot conceive how the foot of a man could become entangled in the common stirrup, unless, indeed, he wore buckles, or something improper about his feet. A boy's foot might perhaps go through the stirrup. The greater part of such accidents have happened to boys, who have placed their feet—not in the stirrup, but in the stirrup-leathers.

#### THE SEAT AND THE BALANCE.

The seat is the conformation or disposition of the several parts or members of the rider in correspondence with the position or motion of the horse. For instance, when a horse plunges, kicks, or jumps, if you have not a strong muscular hold with your legs and thighs, assisted by a corresponding motion or exertion of the body, you will be unhorsed. The very perfection of the seat is, to be ready and prepared for every emergency without much effort: and, by way of contradistinction, it may be observed, that a person may sit prepared for a horse's rearing, and would tumble over his head should the animal fall on his knees. Again, a person prepared against kicking only, would be in danger should the horse rear. The art of horsemanship, therefore, is to give the rider confidence and safety in all positions, and under every circumstance.

When seated in the saddle, the body should be upright, and the shoulders thrown back, the foot well home in the stirrup, and the latter of such length as to elevate the fork of the rider above the pommel of the saddle when he raises himself or stands in the stir-

rup. He will thus have an easy, pleasant seat, his knee somewhat bent, and his foot placed horizontally in the stirrup. The rider thus acquires an easy, elegant, and firm seat, by which he is enabled to bring the muscular strength of his legs into operation in a sort of involuntary or spontaneous manner, and is consequently prepared for every emergency. It is true, this position of the rider differs from that of the manège, inasmuch as it is neither so stiff, so formal, nor so insecure. The disciples of the manège will start at this, but it is not the less true on that account; for, let it be recollected, that manège riding is systematic to a mechanical degree, and that the rider is always prepared for the operation of the horse; even the capriole, the most difficult and most notable feat in the whole system, is rendered easy to sit, since the rider, aware of what is coming, deliberately prepares himself for it; it takes place too in the school, upon an animal trained expressly for the purpose. But on the road, and in the field, the case is different; for instance, in trotting smartly along the road, a spirited horse, in high condition, will start occasionally at the sudden flight of a bird from the hedge, or other trifling circumstance; the animal will start on one side so suddenly as to disarrange the seat or position of the rider, and he will be very apt to come to the ground with the long stirrup and the stiff perpendicular position of the manège, or may, perhaps, receive a serious injury from the pommel of the saddle. In the field, various circumstances are constantly occurring against which manège riding is but a poor protection.

The great security of a horseman's seat is the grasp of the knee and the calf of the leg; and of the decided superiority of the position which I have described, compared to that of the manège, any person may easily convince himself by getting on the back of a horse, and trying the experiment. With the stirrup the length I have pointed out, and the foot placed in it according to my directions, he will perceive he has a firm bearing, and a strong grasp of the horse's sides; on the contrary, with the stirrup long, and heel sunk as low as possible, he will find himself unable firmly to grasp the sides of the horse, or, indeed, of exerting the muscles of the legs and thighs laterally, as they are rendered incapable of it by that perpendicular stretch or extension, which they cannot fail to experience under such circumstances.

The head should be upright, chest thrown a little out, back a little hollow; the arms, from the shoulders to the elbows, should hang perpendicularly by your side; the elbows bent, so that the left hand should be situated about two or three inches above the pommel of the saddle; the arm above the wrist, may lightly rest against the body; and the wrist so bent that, the thumb being upwards, resting on the first joint of the fore finger, may point between the horse's ears. The right hand, holding the whip, should be placed

rather lower than the other, in order that it may not obstruct the operation of the bridle. Hence you will perceive the nose and the breast will be perpendicular, the knee and toe advanced a trifle beyond this imaginary perpendicular line. The sight of the foot should be, in a great measure, obstructed by the knee. The whip, if carried with the lash downward, should not touch the hind quarter of the horse; it may be carried with the lash upward, near the rider's shoulder, the hand taking the other end between the finger and thumb, after the manner in which a pen is held.

A person will, no doubt, feel stiff and awkward when first placed on the back of a horse, which, however, will subside in a much shorter time than might be expected. Nor is it, indeed, necessary that a person should always ride strictly in the above position; but, inasmuch as it constitutes the fundamental principle of the science of horsemanship, the rider should well understand it, and can afterwards exercise his judgment when to use the power of which he feels himself capable.

When seated in the saddle, the thighs should be inclined as much inwards as feels pleasant to the rider; the same may be said of the legs and the toes. There are, however, situations on horseback where a trilling deviation of the legs and toes becomes advisable, which will be pointed out in their proper places.

It will be easily perceived, that the seat which I have described removes the weight of the body (in a great degree) from resting on the absolute fork, and consequently ruptures become much less liable, to say nothing of the superior ease, gracefulness, and security of the rider. In the position in which the horseman is placed in the book published under the name of Allan (already noticed) it would not be possible to ride without great pain and great danger.

The rider should always be in a position to maintain the seat and preserve the balance also; by the latter is meant the preservation of the body from inclining to one side or the other. The seat is keeping firm in the saddle at such times as the body is liable to be thrown on the horse's neck, or over his head, tumbling backwards, &c.

To preserve the balance, the body must keep in the same direction as the horse's legs; for instance, in trotting or galloping round a course, the horse will be found to lean inwards, and therefore to preserve the balance the body of the rider must take a corresponding position. Similar remarks are applicable should the horse move in a circle, &c.

In order to acquire the correct balance, practice in circles (the longe) is very useful, beginning on large circles, and an easy trot, contracting the circles and extending the pace by degrees. The tyro should practice, in the first instance, without stirrups; and, when he has acquired confidence, let him quit the

bridle-reins, (the master or an assistant attending to the longe), and he not will fail to acquire a good balance and firm seat. The circles should be worked both to the right and left. A little practice with the hands placed behind the back, will throw up the chest, and give the rider an elegant position.

### THE HANDS AND THEIR ACCOMPANIMENTS.

I have already observed, that the essential principle of horsemanship mainly consists in the corresponding motion or position of the rider with that of the horse; that is, the motions of horse and rider should be in unison, or complete correspondence with each other; and for the attainment and preservation of this desirable object, the rider must be principally indebted to the operation of his hands.

The judicious application of the hands constitutes the excellence of horsemanship. In the case of restive or vicious horses, the hands are the principal security of the rider, and baffle or counteract the efforts of the horse.

It may be further remarked, that the ease, the grace, and elegance of horsemanship arise from the hand. By it the rider lightens the mouth, raises the forehand, and directs the motion of the horse.

This subject is not sufficiently attended to by horsemen in general, and by grooms in particular; indeed, a groom is rarely seen who understands the correct application of the hands; and the same observation is applicable to many of those who make a living by horse-breaking. Most of the latter are, indeed, persons who have been originally grooms, and either from bad conduct, or some other cause, having lost their situations, resort to horse-breaking as the means of a livelihood.

The circumstance of defective hands originates a preference to what are called snaffle-bridle horses. Persons who prefer snaffle-bridle horses know not how to handle the reins, since there are no horses but what will ride much pleasanter with a double bridle, when the rider understands the proper management of it.

In order to acquire the correct and complete operation and effect of the hands, an expertness in managing the reins is indispensable. Like other operations, it requires practice before the rider can well understand the business—before he can accommodate his hand to the mouth of the horse. For instance, it can scarcely have escaped the notice of any person, as the circumstance is by no means an uncommon occurrence, that when an inexperienced or awkward horseman has hold of the curb-rein, it prevents the horse from standing quiet, owing to the pain which the animal experiences. He, at length, loosens the curb-rein, when the horse becomes quiet, because the irritation and pain ceases. Now, to what does this amount? Not that the curb was improper, but that the rider did not under-

stand the management of it; he held the curb-rein too tightly for the feeling or sensibility of the horse's mouth, and consequently rendered the animal uneasy. The same degree of tightness or pull at the curb with a horse of a less delicate mouth would have produced no uneasy sensations in the horse, and he would, therefore, have remained quiet. Hence the necessity of accommodating the hand to the feeling of the horse's mouth; and as this feeling varies in different horses, so the operation of the hand should vary accordingly. What are called hard-mouthed horses are unpleasant to ride; but, as their mouths have been rendered insensible from improper treatment, the defect may be remedied by the judicious operation of the hand.

In my observations, I have had the common double bridle in view; yet it must not be forgotten, that other bridles are used, which will be noticed hereafter; and in the management of which the rider could be at no loss, after having made himself well acquainted with the previous instructions.

If it be thought desirable to change the reins from the left to the right hand, it should be performed in the following manner: turn the thumb of the left hand towards the right, put the fore-finger of the right hand downwards, between the reins in the place of the little finger of the left hand, and lay the reins smoothly through the right hand; by which the fore-finger separates the left reins from the right, and the superfluous reins hang downward through the hand; the thumb presses the left reins between the first and second joint of the fore-finger. The whip still remains in the right hand, but may be easily shifted if the rider wish it. Should the reins become shorter by this method of shifting them, they should be allowed to slip to their proper length. Shifting them again to the left hand is performed by placing the third finger of the left hand downwards between the left and right reins, laying them smoothly through the hand and letting the ends hang over the fore-finger (as at first) secured by the thumb. Practice of this sort is advisable; and shifting the reins will relieve the left hand when cramped or tired.

Occasionally the reins must be separated, and held in both hands, in order to increase the power of the rider. When a horse refuses obedience to one hand, the other should be applied to the reins; hence all raw young horses are rode with both hands; and whenever both the hands are called into action at the reins, it is only necessary to take the off bridle (snaffle) rein into the right hand; put the three first fingers over the rein in question, by which you will receive it between your little and third finger, pressing it between the fore-finger and thumb.

When a horse is passing over slippery, stony, or uneven ground, the safest method is to apply both hands to the reins, which will enable you to give much more support to the horse in case of his stumbling. Applying

both hands to the reins is requisite in the case of restive or vicious horses, a subject which has been noticed.

Shortening and lengthening the reins are operations too obvious to need detail; in fact, where redundant verbosity is used in the description of evident trifles, it serves to confuse the reader, and render unintelligible what was already sufficiently plain. Yet such is the case in all the publications which have hitherto appeared on the subject of horsemanship.

The judicious operation of the hand is a great attainment in horsemanship. The hand is connected with the reins, the reins to the bridle (snaffle) and curb; the latter operating on the bars of the horse's mouth, and the former on his lips; hence, scarcely a finger can be moved but the mouth of the horse is affected by it; this constitutes what is technically and justly termed the *correspondence*.

A good and masterly hand will make the hard untutored mouth partake of its sensibility, which is what the professed masters would call *dressing* the horse; but as the highest dressed horses, when rode by heavy insensible hands, become as heavy and dead as the hand of the rider, so may the tutored hand, if neglected, abandon its excellent quality, and conform itself to the deadness or callosity of the horse's mouth. Hence it sometimes happens, that horses which gave their owners every satisfaction at first, so alter from the bad hands of themselves, or their servants, that they are under the necessity of parting with them.

In order to convey a correct idea in what manner the hand operates to produce the proper effect on the mouth of the horse, I must observe, in the first place, that the reins should be held in the manner already described, and the hand so placed that the ends of the fingers are opposite to the centre of the rider's body, about the height of the elbow; the reins collected to that precise length, that contracting the muscles of the hand would rein the horse back, and the easing of them would enable him freely to advance. I am, of course, supposing the horse has a good and delicate mouth; or what the French would call *un cheval du bon appui*.

If the hand be held steady as the horse advances in the trot, the finger will perceive, by the contraction and dilatation of the reins, a trifling pull occasioned by the measure or cadence of every step. This trifling pull or sensation, which is equally felt in the hand of the rider and the mouth of the horse, (by means of the *correspondence*) is, in the language of the school called the *appui*;\* and while this *appui* is strictly maintained or continued, the horse is in perfect obedience to the rider, and is directed with so much ease, that he seems to obey the will (as it were) rather than the hand of the rider.

\* *Appui*—which may be translated, in this case, the rest of the horse's mouth upon the hand.

For preserving a medium effect on the mouth, the hand should be only half shut, the joints of the finger next the wrist or knuckles being nearly open. Hence, by extending and shutting the fingers, you acquire sufficient power to control or direct a well-broken and obedient horse.

The power and effect of the hand will soon be perceived by a little practice. The degree of *appui* depends on the relative situation of the hand, and position of the horse: the raising of your hand increases your power, and the raising of the horse's head diminishes his power; and as the situation of the hand, in point of elevation, so powerfully operates on the mouth that every quarter of an inch has a perceptible effect; so has its situation if carried to right or left. In order, however, to avoid as much as possible, moving the arm or hand, the motion of the wrist will produce such positions of the hand, as, being accompanied by the corresponding aids of the body, &c., will effect whatever may be required for a well broken horse.

*Aids* are certain positions of the hand, body, legs, and sometimes the whip, which direct the horse agreeably to the will of the rider; the hand is the principal, the others are called *accompagniments*, which increase the power and efficacy of the hand. Therefore, as the positions of the hand are described, the corresponding aids will also be pointed out.

The first position of the hand (the left hand) is, the thumb upwards, the little finger downwards, so that you can just see the ends of the fingers, and placed as already observed a little higher than the pommel of the saddle. The aids applied to this position of the hand are such as affect the action and position of the horse, as raising his head, and, in the school, working the croup, &c.

The second position of the hand directs the horse to the right; for the accomplishment of which, turn the little finger to the right, the thumb to the left, the nails upward, which will carry the operation of the reins nearly three inches more to the right, by which the left reins will press the neck, and the right reins will become slack, and the horse will move to the right. To give greater efficacy to the motion, the body aids by turning to the right, and, if necessary, likewise inclines, the right leg aiding, at the same time, by pressing it against the side of the horse behind the girths.

The third position of the hand is the second reversed, and consequently directs the horse to the left. It is thus performed; turn the little finger to the left, the thumb to the right, when the back of the hand will be upwards. The right reins will press the neck, the left reins become slack, and the effect will be to move the horse to the left. The corresponding aid is turning the body to the left and pressing the left leg against the horse's side,

in a similar manner to that which was directed for the right.

These aids are to be applied in proportion to the effect you wish to produce, and great exactness, uniformity, and delicacy, are requisite to correctness of execution. By way of illustration: these aids, properly managed, will turn the horse on three distinct and separate pivots; first, on his centre, by which is meant that point directly under the seat of the horseman, in which the fore-feet take the place of the hind, and the hind of the fore. Secondly, on the fore-feet, in which the fore-feet keep their ground, and the hind-feet move round them. Lastly, on the hind-feet, which keep the centre, whilst the fore-feet describe the circle. Further, conceive a circle of twenty yards diameter, and the number of circles which can be described within its circumference; hence it will be easily perceived that so many degrees of operation these aids will have to perform. The smaller the circle, the greater must be the degree of aid, and *vice versâ*; and although upon a large circle, the aids are scarcely perceptible, yet, if they were not called into operation the horse would move in a straight line.

Whether you move to the right or left, let the aids of the hand, body, and legs, exactly correspond, and practice as much to the one hand as the other; or, at least, practice till you are equally expert with both. At first proceed slowly, for you will thus much sooner acquire the proper method; and when you turn rapidly, the aids must be strongly given accordingly.

Many horses will at first testify reluctance to being thus twisted about; (and, indeed, it will never be absolutely necessary, except in the manège or military riding,) in which case apply the other hand to the reins; for though the delicacy of the operation will be superseded, that is of much less consequence than the non-performance of it. Should the resistance of the horse require a considerable strength of the hand, your power to force him to compliance increases in proportion as the hand is taken from the body; so that when you pull in the direction from the horse's mouth to the horse's croup, your power is very much greater than when you pull in a line to the centre of your body. The other aids must be given in proportion, and the rider must be guided in a great degree by his own discretion.

The fourth operation of the hand is to induce the horse to rein back. The first position is sufficient for this purpose. The reins being properly adjusted, the pressure of the finger, or closing the hand will be sufficient for delicate mouthed horses; but, in order to give greater efficacy, turn the knuckles a little down, and draw in the belly, the body rather inclining forward, which will give the hand greater effect, without provoking the horse to rear, which would be likely enough to happen with horses which do not readily obey the hand, particularly if the rider lean back

to acquire more power, which would place him in great danger, because he would not be in a situation to act under such circumstances. The horse would, perhaps, be pulled backward upon the rider.

In reining back, should the horse not readily obey, play with his mouth by moving the fingers. This will induce him to raise his head; gently close your legs, which will bring him together, (make him *unite*) and then the closing of the fingers will induce him to rein back. The instant the horse is constrained to back, the body, if in a proper position, will incline forward, and the fingers must be eased, otherwise the horse must be backed till he falls. Therefore, as soon as the horse yields to the hand, the body and hand should yield to the horse, that he may recover his balance, and the little alarm the operation has occasioned him, when you may gently invite him to back again.

Reining back is principally required in the army and the school; practising it a little, however, will tend to make any person a more complete or finished horseman. But the practice must be conducted with mildness and good temper, and not continued too long at a time, lest the horse should become impatient.

Let it be recollected that the hand must always maintain a determined firmness; it must not yield to the craving of the horse to get the ascendancy. For instance, a horse will, if permitted, abandon that delicate correspondence which produces the *appui*, and loll a dull weight on the hand. A horse, however, well broke, after being ridden for a while with a dull heavy hand, will generally fall into this habit, and is consequently liable to fall down and break his knees, and, perhaps, the rider's neck or limbs. A horseman, therefore, should always use a light and lively hand. Should the horse persevere in his attempts to attain the ascendancy, the reins should be shaken to induce him to raise his head, the correction of the hand must be given severely, in the following manner: yield the hand so that the reins become slack, then give them a smart pull or snatch in an upward direction, which will make him raise his head, and the apprehension of your repeating it will deter him from putting it down again.

Having spoken of the *firmness* of the hand in a direct sense, a few words more on the subject, collaterally, or by way of qualification, become necessary; since, although the hand must be sufficiently firm and decisive to enforce the requisite submission, yet it should be susceptible of a delicate and sensitive feeling, soft, pliant, and discriminating, in order to accommodate the horse under every circumstance. By the feeling of the hand the rider should become aware whether the horse wishes to disengage himself from the restriction of the hand, or whether he desires a momentary freedom for his own ease. For instance, he will remove your hand if he wants to cough; he will move his head if cramped by too long confinement, to

drive off flies, &c, under such circumstances the horse is entitled to all reasonable indulgence.

Further, in addition to the properties already enumerated, the hand should possess an enlivening, animating quality, which the horse will easily understand and readily obey. This is a light movement of the fingers and the muscles of the hand, which is communicated to the mouth of the horse, raises his expectations, and keeps him lively. It also eases and refreshes the horse's mouth.

#### THE ALLOTMENT SYSTEM.

At a meeting of the Somersetshire Agricultural Labourers' Friends' Society, held in the Bath Assembly Rooms, the Bishop of Bath in the Chair, in the course of the proceedings several speeches having been made, the following calculations were submitted by Dr. Parry:—

The number of acres in England alone, according to population returns, are . . . . .	31,770,615
Of which those under cultivation, or which are capable of cultivation, are supposed to amount to . . . . .	29,000,000

According to the same returns, the labourers employed in Agriculture are . . . . .	744,407
The labourers not agricultural . . . . .	500,000

Total . . . . . 1,245,357

If 744,407 labourers in agriculture have, of the above amount of acres under cultivation, &c.,  $\frac{1}{4}$  acre each, 186,102 acres will be required, or about 1-155 part; or, in every 1000 acres, 6 acres 100-155.

Should these labourers receive only 20 perches each (and 30 perhaps is the present average), then would be required only 93,051 acres, 1-310 of the whole, or about  $3\frac{1}{2}$  acres in every 1000.

Or, secondly, supposing all the labourers, agricultural and not agricultural, were admitted, and had each  $\frac{1}{4}$  acre, then 311,339 acres, or rather more than 1-93 part of the whole cultivated or cultivable lands in England would be required; or, at 20 perches each, only 1-186 part, being as 10 70-93 and 5 70-186 acres in every 1000.

Now, if the produce of one acre, thus cultivated, may be valued at 20*l.*, and in some cases it is reckoned at 26*l.*, 27*l.*, even up to 60*l.*, it is clear that the whole value of the land thus cultivated by the surplus labour of the agriculturists alone, at  $\frac{1}{4}$  acre each, is 3,722,040*l.*; or, divided amongst them is 5*l.* per head, or, reckoning 10*s.* for the rent of each allotment, 4*l.* 10*s.*; and in the same proportion for the smaller amount.

If, again, the labourers, agricultural and not agricultural, were occupying  $\frac{1}{4}$  acre each, the money value of the whole produce would be 6,226,780*l.*; or deducting as before, 4*l.* 10*s.* per head.

Now it will be observed that, on the supposition of the whole labouring population being possessed of  $\frac{1}{4}$  acre each, and that the money amount obtained by the surplus labour bestowed on field gardens equals, as it may fairly be presumed to do when the system is in operation throughout the kingdom, 6,226,780*l.*, such amount is only 159,754*l.* short of the whole sum expended for the relief of the poor, in the year ending March 25, 1833 (6,486,534*l.*); or, deducting 1-10 as the charge of rent paid, there then remains only 882,442*l.* as a balance on the side of the late poor law expenditure, above the amount which may, it appears, be fairly within the reach of the surplus labour of those who may be benefited by the introduction of this system.

AGRICULTURAL DISTRESS.

[FROM A CORRESPONDENT OF THE CHRONICLE.]

The numerous meetings on this subject, at all of which it is unanimously asserted that the agricultural interest is much depressed, although there is great difference of opinion as to the cause, deserve attention, and as all seem to point at some Legislative remedy, it is very important, particularly to the farmer, that the measure, be it what it may, should not be a delusive one.

Though in inquiries of this sort you seldom hear any party mentioned except the landlords and tenants, whose interests are said to be the same, there are other interests deeply affected; the evil, if it exists, spreads far and wide amongst tradesmen and manufacturers, and falls heavily on the poor agricultural labourers.

Much confusion has arisen on this subject by confounding the character of landowner and landlord, and farmer and tenant; the interests of landowner and farmer are as directly opposed to each other as the interests of buyer and seller in any other commodity; they are two distinct and independent characters; they have each their own separate commodity to dispose of; each seeks to obtain, by barter, a portion of the other's; the landowner's capital is his soil, that of the farmer his skill, industry, and money or stock; the landowner stands in need of the skill and industry of the farmer, and the temporary use of his money or stock; the farmer requires the temporary occupation of the landowner's soil, but neither of them contemplate parting with any portion of his realized capital. The landowner has no more right to possess himself of any portion of the farmer's money or stock, than the farmer has to retain any portion of the other's land; their bargain is, or ought to be, about the surplus of the produce of the soil which shall remain after the costs of raising it and converting it into money have been satisfied.

When the bargain is settled, the parties become landlord and tenant, and such a change has taken place in their relative positions, that it would seem reasonable to expect that they would mutually exert themselves to render the surplus produce of the land as large as possible. Is this so in practice? It is to be feared not.

Before we proceed further, let us see how this surplus, if any, is produced: the land in the hands of the owner is liable to tithes, land-tax, county, church, and parochial rates; these attach the moment the plough enters, and must be paid; the farmer, his labourers, and stock must be supported, or there can be no production, and if no production there can be no surplus; and the securing and converting the produce into money is equally essential to a beneficial result; all these outlays must be provided for, before the farmer can have any interest for the use of his capital, or the landowner fairly claim anything for the use of his land. It is obviously, therefore, under a just system, the interest of the landowner and farmer to render these outlays as low as is consistent with good husbandry; but the landlords have been the makers of the laws, and have devised a thing called *rent*, which they exact whether there is any surplus or not; if their *rent* is not paid they take not only the produce on the land without any regard to the outlay of the tenant, or of interest for the use of his capital, but they seize upon his stock also; whereas, if the outlay has absorbed the whole produce of the land, the landlord in justice ought not to claim any *rent*, and if the outlay exceeds the produce, the loss should be mutual, and borne in the same proportions in which the profits were to be shared; the landlord has no better right, in common honesty, to a part of the tenant's capital than the tenant has to a portion of the landlord's soil; if matters stood on this sound footing, the interest of the landlord and tenant would be identically the same; as matters now stand a complete severance is effected, and the question is, how can these conflicting interests be reconciled, or at least rendered innocuous to each other. This can only be done by relieving the tenant; and as

it is not at present to be expected that the landlords will relinquish their power of exacting *rent*, the relief must be of such a nature as to secure an adequate *surplus* in the hands of the tenant.

It is, I believe, very generally admitted that for several years past the landlords have been taking their *rents* from the capital of their tenants; and the landlords' cry has been, that the distress of their tenants and labourers is occasioned by what they term the ruinous low prices; but let me caution the tenants and farmers generally against expecting any relief for either themselves or their labourers from any measure having for its object an increase in the price of agricultural produce; its prices are, no doubt, at this time low, but they are only relatively so; they are low when compared with the tenant's outlay. Yet they will be lower, they must and will, in spite of any Legislative attempts either to raise or to sustain them, approximate nearer to those of other countries; and why cannot the farmers of England obtain a surplus from prices which are higher than such as are remunerative to the foreigner? Are their skill and industry less? Have they less capital at their command? Are their implements inferior? Are their labourers less laborious? Are their markets more remote? In all these respects they have a decided advantage over the farmers of every other country; then, why are not the higher prices they obtain remunerative? Simply because their outlay is greater; and why is it greater? The answer is equally simple, it is because the cost of every article they use or consume is aggravated by a system which raises the revenue by taxes on articles of use and consumption instead of from realized property, the only fair subject for taxation.

It has been customary for the advocates of the present system, when pressed on this point, to admit that taxes on articles of use and consumption have the effect of raising the price of the taxed article about 30 per cent. on the amount of the tax, and this is made out in the following manner:—

	£.	s.	d.
Say an article is taxed to the extent of ..	100	0	0
Add the charges of the merchant over producer, for interest and extra risk, 10 per cent. .. .. .	10	0	0
	<hr/>		
Increase .. .. .	110	0	0
	<hr/>		
The cost to the wholesale dealer being increased to .. .. .	110	0	0
He adds for interest, risk, &c., 10 per cent. .. .. .	11	0	0
	<hr/>		
Increase .. .. .	121	0	0
	<hr/>		
The retail dealer having to pay .. .. .	121	0	0
Charges for interest, extra risk, &c., 10 per cent .. .. .	12	2	0
	<hr/>		
Total Increase .. .. .	133	2	0
	<hr/>		
Total Increase .. .. .	33	2	0

The above, however, is not an honest statement of the case, for though it be admitted that the merchant or producer may not add, in the first instance, more than 10 per cent., it is well known that the wholesale dealers add at least 15 per cent., and the retailers upwards of 20 per cent., so that the direct effect is to increase a tax of 100*l.* to at least 150*l.*; but this is a trifling evil when compared to the indirect effect of taxes on articles of use and consumption.

The difficulty, and, as some have imagined, the impossibility, of tracing this effect, in a country where the distribution of the four necessaries of life—food, clothing, habitation, and domestic necessaries—create upwards of four hundred different occupations, through all the ramifications of which this indirect effect is felt, have led people either to deny its existence, or to contend that its effect is trifling, because its operation on any minute portion of any one of those necessaries appears trifling; but if all the merchants, manufacturers, and tradesmen employed in furnishing and distributing

these four necessaries are divided into four classes, represented by the four letters, A, B, C, and D, and instead of speaking of millions it be, for the convenience of calculation, assumed that their several and respective annual sales amount to the sum of five hundred pounds each, on one of which a tax of 30 per cent. *ad valorem* (a very low estimate) is imposed, it will not be difficult to see the effect of its operation on *all other* articles,

	£	s.	d.
Suppose the sales by A to B as representing all the customers of A to be . . .	500	0	0
Add a tax of 30 per cent. <i>ad valorem</i> ..	150	0	0
The direct effect of this tax, taken on the lowest scale of 33 per cent, is . . .	46	10	0
	696	10	0
Increase . . . . .	196	10	0

B, or the customers of A, having been accustomed to pay him only 500*l.*, now find that A's charge is increased from 500. to 696*l.* 10*s.* The customers of A, that is, B, immediately, as a matter of course, add the 196*l.* 10*s.* to the price of their own articles, increasing the charge, which had before been only 500*l.* to 696*l.* 10*s.*; the effect of which is as follows:—

	£.	s.	d.
The amount of B's sale, say to C, as representing all his (B') customers, were formerly only . . . . .	500	0	0
Increase, to countervail the additional charge of A . . . . .	196	10	0
On the 196 <i>l.</i> 10 <i>s.</i> the consumer will be charged 33 per cent., because, as articles of use and consumption generally pass through three hands at least, he will have to pay, in the shape of interest and risk, &c., at least . . .	64	5	10
	760	15	10
Increase . . . . .	260	15	10

Take C's original charge to D., as representing all his customers, at . . .	500	0	0
Add, to cover the greater charge of B..	260	15	10
Add 33 per cent. on 260 <i>l.</i> 15 <i>s.</i> 10 <i>d.</i> . . .	86	2	7
	846	18	5
Increase . . . . .	346	18	5

The original charge of D . . . . .	500	0	0
Add additional charge of C. . . . .	346	18	5
Add 33 per cent. on 346 <i>l.</i> 18 <i>s.</i> 5 <i>d.</i> . . .	114	10	2½
	961	8	7½
Increase . . . . .	461	8	7½

Total increase . . . . . 1,265 12 10½

To which must be added the effect of the re-action on A., in consequence of the increase in the prices of all other articles; for whatever may be said to the contrary, trade-men will endeavour to indemnify themselves against the increased prices of the goods they are obliged to purchase, by increasing the prices of those they sell.

From the foregoing statement it is obvious that every pound paid into the Exchequer, raised by taxes on consumption, abstracts from the pockets of the people in payment of the tax, and by increased prices on all articles, upwards of 9*l.* It is this that occasions the distress of the farmer and his labourers. The farmers' articles are of a nature that will not admit of being raised in price in proportion to the articles he and his labourers use and consume—he therefore is the sufferer; but as the evil is one inflicted by the Legislature, and the Legislature has the power to remove it, not only has the Legislature the power to remove it, but it would, by removing it, and raising the revenue from property, render the greatest possible benefit to property itself. But the landowner cannot, or will not see this. As long as taxes are

confined to articles of use and consumption, he fancies that he in some degree escapes, because they fall heaviest upon industry which he cannot consent to relieve; although, by relieving it, he would himself be benefited, for it is obvious that if all taxes on articles of use and consumption were repealed, 100*l.* in the hands of the landowner would procure for him as many of the necessaries and luxuries of life as at present cost him 370*l.*, indeed, we may safely say 400*l.*; in other words, an income of 1,000*l.* a year would be equivalent to one of 4,000*l.*

Again, let us suppose 1*l.* to represent the whole revenue paid into the Exchequer, and that the whole is paid by property, but that in order to raise that 1*l.* there are 9*l.* abstracted from the pockets of the population. What proportion of the 9*l.* falls on the shoulders of property? One-third at least: so that property prefers paying 3*l.* rather than 1*l.*, because so long as it continues to pay 3*l.* it compels industry to pay 6*l.*, out of which it is weak enough to suppose it will be indemnified by the high prices it expects to receive for the produce of its land, and, say the mortgagors, if a property tax is substituted for taxes on consumption, half the lands in the kingdom will change hands. Indeed! I conceive the very reverse must happen, because the working of the soil and the cost of living to the landlord, as well as of his tenants and labourers, would be less; and the mortgagees, the absentees, and accumulating capitalists, who now comparatively escape, would bear their fair share of the burden which now falls heavily and disproportionately on the incumbered landowner; this is clearly and distinctly implied in the very term "Property Tax." It is the opulence, and not the poverty, of the country that bear the imposts; the mortgagees, and not the mortgors; the substantial, and not the nominal proprietor; but suppose that in consequence of taxes being repealed prices are reduced; suppose tithes put on an equitable footing, which never can be done till the Corn-laws are repealed, and a property-tax substituted for all other taxes, and all pretences for high rents removed, it should happen that the mortgage interest of a few improvident mortgagors is unpaid, and the mortgagees foreclose; suppose a few estates, under such circumstances change hands, what of that? The land is still there, the mortgagors have received its full value or more, is there any thing unjust in requiring such mortgagors to surrender it? and is it not monstrously wicked to keep up, unnecessarily, a system of high prices to the impoverishment and ruin of the industrious, in order to maintain a few improvident mortgagors in possession of what is not their own?

The farmer's remedy and his only relief is a "Property-tax," in lieu and substitution of all others, and the yeomen of England will again be, as they formerly were, the boast and glory of their country. A. L.

December 12.

EXTRAORDINARY HEIFER.—A very fine heifer, of the short-horned breed, was slaughtered in Durlam, on Thursday week, by Mr. Cornwell, the butcher. She was an animal of singular beauty and symmetry, and was bred and fed by Mr. Hoult, of Rushlyford. That gentleman did not intend her for the butcher, but wished to keep her for a breeder. As she turned out barren, however, he reluctantly abandoned his original purpose. She was 4 years old, and though not fattened for the knife, her carcass is supposed to weigh upwards of 80 stones, of 14*lbs.* to the stone. We have seen some surprising animals which have been fed to very great weights; but we never beheld one which possessed greater propensity to fatten than this or greater capability to be rendered one of the most extraordinary of her species. Her carcass merits the attention of all amateurs in the science of stock-breeding, and particularly of the admirers of the short-horned kind. She was descended from the stock of C. Mason, Esq., of Chilton. We understand that clever and rising young artist, Mr. R. Robson, jun., is now engaged in painting a portrait of the animal—than which, though it may sound strangely to delicate ears, he could hardly have a fairer subject for his pencil.

**LETTER FROM A. G. SPIERS, ESQ. M. P.  
FOR PAISLEY, TO R. MONTGOMERY  
MARTIN, ESQ., SECRETARY TO THE  
ROYAL AGRICULTURAL ASSOCIA-  
TION.**

*Culcreuch, Dec. 13, 1835.*

Sir—I had the honour of receiving your circular, dated the 23d ult., inviting me to become a member of the Royal Agricultural Society, proposed to be instituted in London. If I could persuade myself that the sole objects of this projected institution were similar to those of the Highland Society of Scotland, *i. e.*, to improve the science and encourage the practice of agriculture itself, and generally those arts connected with it, then I would not hesitate to add my name to those of the noblemen and gentlemen who have already agreed to become members; but when I perceive, from the very origin of your Society (the political resolutions of the meeting of deputations at Aylesbury, on the 12th ult.), that the chief purpose for which it is founded is the combination of agriculturists “as a body” with a view to check and controul the Government of the country, and from your choice of a leader, in the person of a Noble Lord who has honestly, but, as I think, upon very erroneous grounds, stood forward as the champion of monopoly and restriction, I deem it my duty not merely to refrain from all connection with such a society, but also to state frankly that its principles are in my opinion hostile to the true interests of Britain, and, moreover, that under the guise of an agricultural association, its projectors have no other object in view than to create a powerful instrument for accomplishing the political ends of the Tory party.

I have long been of opinion that the present Corn Laws—prejudicial as they confessedly are to the commercial interests—are beneficial neither to landlord nor tenant; in other words, that high duties will not produce high prices—that to promote the interests of one class of the community at the expense of the rest is ultimately prejudicial to all—and hence, that the sooner every restriction and monopoly, and all taxation affecting the price of food, or that of the raw materials of our manufactures, are abolished the better. In making any changes, I am well aware that the varied and complicated interests of Britain render it necessary to proceed with great caution, yet I do not admit the impossibility of establishing the prosperity and welfare of the whole empire on a surer basis than it now stands, by a thorough revision of that restrictive system which has so long, in my opinion, cramped the energy of the nation and given to foreigners an undue advantage; and, therefore, I can give no support, directly or indirectly, to a society which is avowedly instituted for the purpose of exclusively protecting what are termed the agricultural interests, “of pressing those interests on Government or Parliament,” and of combining and directing the exertions of the agriculturists, “as a body;” “whenever any measure may be brought forward by Government, or the Legislature, which may be thought injurious to the prosperity of agriculture.” I am satisfied that the prosperity of the nation at large is the best foundation for the prosperity of the agricultural classes, and that it is a mischievous delusion to induce these classes to look for a rise of rents or of prices from any legislative measure; or, indeed, to look for a rise of rents or prices at all. Their true friends should encourage a better and more scientific system of tillage—a reduction of rents commensurate with the reduction of prices of commodities gene-

rally—as much relief from taxation, and an abrogation of all commercial restrictions—the prosperity of trade and commerce affording the surest prospect, by an increased consumption of agricultural produce, of improving the condition of the agriculturist. A landowner myself, I entertain generally the opinions of one of the most enlightened and soundest-thinking men in England on the Corn Laws, my Lord Fitzwilliam, and as his Lordship happens to be one of the largest landowners in the country he cannot surely be considered likely to promulgate opinions, or countenance doctrines inimical to that class with which he is peculiarly and intimately connected.

If I cannot consistently entertain the views, apart from politics, on which your proposed society is based, still less can I be a party to those views of a political nature, which, I am sorry to add, appear to me to have had a more predominant influence in the projection of the institution, than any conviction either of its necessity or its ultimate utility in removing agricultural distress. You have assembled, apparently at the bidding, at all events under the direction, of the Marquis of Chandos—a nobleman violently Conservative in his politics, hostile to the present Liberal Ministry, and a decided advocate of the Corn Laws, and of restrictions and monopolies. You have assumed the necessity of union for mutual protection and efficiency, based on the two following resolutions of the Aylesbury meeting, passed under the auspices of the same nobleman:—

“That heretofore all efforts to obtain from the Government, or from Parliament, efficient relief for agricultural distress have failed, and inquiry has twice been refused, owing to the divided state of the agricultural body and their want of co-operation.

“It is therefore advisable that the various agricultural associations now scattered throughout the kingdom, and hitherto powerless from want of union, do concentrate their forces and form a grand central society, or board of agriculture, in London.”

Your very first object is stated by yourselves to be protection to one class of interests, and the forcing of those interests on the notice of the Government or the Legislature; your next object is avowed to be the “calling forth combination and direction of the exertions of the agriculturists as a body;” to oppose Government, if thought necessary, or to force measures on its attention. Such appear to be your real and great aims. Merely subordinate to these objects is the protection of a hall, of meetings, and of a quarterly publication, &c., devoted to the agricultural interests, which appears in your prospectus. The only conclusion which I can draw from these premises is, that your association is really meant to be a Tory combination to overawe the Government and the Legislature—to force upon both any measure, however faulty in principle or pernicious in tendency, which may be calculated to serve Tory purposes—and, in short, to erect, as it were, a powerful Tory battery, from which all that appears to me really based on sound principle in politics, and all that is projected by a Liberal Administration for the good of the people—including, of course, the agricultural classes—may be most effectually assailed. Nothing, in my opinion, can be more objectionable in principle, or more pernicious in practice: and instead of giving the scheme that countenance and support which you claim for it, the duty of every Liberal politician ought to be to denounce and oppose it.

In conclusion, may I ask if the agriculturists can expect the other classes of the community to remain “disunited,” and therefore “powerless,” when

they see the agriculturists combining under the leading of noble Lords and Gentlemen? The example may be followed, and this projected society will have whatever credit may result from leading the way in that most pernicious consummation—placing one class in a state of enmity or war with another.—I have the honour to be, Sir, &c.

A. G. SPIERS.

### HOP DUTIES.

The following are extracts from the sixteenth report of the commissioners of Excise Inquiry:—

“From the inquiries which we have had opportunities of making on the subject, (the hop tax), we have reason to think that the arrangements made by the department for the charge and collection of this head of duty are well adapted to their object, whilst they have the recommendation of being carried into effect with the greatest degree of economy that the case will admit of.

“From the following return of the expense of its collection in each of the last three years, it will be seen that such expense amounts to a very small per centage on the revenue derived from a good crop.

“A return of the total amount of the expense of collection of the hop duty for the three years ending 5th January, 1835:—

	Amount.
Years ending Jan. 5	{ 1833.. £3,316 4 11½
	{ 1834.. 3,432 11 10½
	{ 1835.. 3,675 13 7

“G. A. COTTRELL,  
First General Accountant.  
Excise Office, London, 21st May, 1835.

“We should also state that the result of our inquiries has been to satisfy us that the hop-growers were not subject to any inconvenient interference by the officers of Excise in the process of their operations. For the purpose of further ascertaining the general feeling of the growers upon this subject, we directed a circular letter to be addressed to the several Members of Parliament representing counties in which hops were principally cultivated, requesting them to communicate with their constituents, and to acquaint us with the result of their inquiries. The answers returned to these communications will be found in the appendix; and it will appear from them that the growers are generally satisfied with the present arrangements for the collection of the duty, and are not desirous of any change either in the rate of duty or in the regulations under which it is charged.

“In referring, however, to this tendency to increase of cultivation, it should be borne in mind, that hops are included amongst those articles of general consumption, the supply of which is in a great degree confined to the home grower, by a customs duty amounting almost to a prohibition on their importation from foreign countries. We have not the means of ascertaining the extent to which the price of hops is thus artificially increased to the consumer in England, but whatever may be the extent, there can be no doubt that the addition as far as it goes, inflicts an injury on the public as consumers, by unnecessarily limiting the supply, and enhancing the cost of the article produced. The amount and effect of the customs duty on hops, though not the immediate object of our consideration, being thus incidentally brought under our notice, we have felt ourselves called upon to express our opinion, that the attempt in this, as in similar instances, to interfere

with the natural course of demand and supply, by a system of prohibitory duties, is opposed to the soundest principles of general policy. It may be added, that the high customs duty (3*l* 1*s* per cwt.) on hops, has not only the immediate effect to which we have above adverted, of raising unnecessarily, the price to the consumer, but also further operates to his disadvantage, by preventing him from taking the full benefit which might result from a reduction of the excise duty, since, under a system of monopoly such as that which is secured to the home grower by the prohibition against a foreign supply, there would be little prospect that a diminution of Excise duty would be followed by a corresponding diminution of price in the market; and, under these circumstances, there seems to be no reason why the revenue should not benefit by the present amount of duty, more especially as hops are comprised in that class of articles to which we have already referred in our seventh report, as being more fitting subjects for taxation than those which may be reckoned among useful manufactures.”

[Extract from a Speech of H. Handley, Esq.,  
M.P., taken from the BOSTON HERALD of  
Dec. 24, 1835.]

“He (Mr. Handley) now wished to call the attention to a subject, in which he conceived they were deeply interested, and on which he had long desired an opportunity of addressing them. He alluded to the ruinously low prices of tallow. (*Hear.*) He had frequently, when standing amongst the sheep-pens of Smithfield, been much struck with the trifling and disproportionate disparity in price between sheep weighing say 24*lbs*. per quarter, and others weighing 30*lbs*., the quality of meat being similar, and differing mainly in their relative degrees of fatness. The butcher now-a-days turned away from those points which heretofore first drew his attention, and the observation of the passer-by, on viewing such a show of Christmas meat as their shops had that day exhibited, was no longer one of admiration at the perfection to which the animal had been fed, but a sorrowful exclamation of “what waste!” (*Hear, hear.*) In fact, the fifth quarter, formerly denominated the butcher’s profit, no longer remunerated him; and as he could not, any more than other tradesmen, afford to purchase at a loss, the difference fell exclusively on the grazier. (*Cheers.*) It was well known to many of his friends, that this subject had occupied his attention during the last session of Parliament, and he had in the course of some observations he had made in the House of Commons, when the Chancellor of the Exchequer introduced his Budget, endeavoured to draw his attention to it. On communicating with a most intelligent gentleman connected with the manufacturers of soap, he found that they, so far from benefiting by our loss, were themselves in an unprosperous state, and complaining heavily of the prejudicial operation of the Excise upon their trade. He held in his hand a memorial from the soap manufacturers to the Lords Commissioners of the Treasury; they complained of the inefficiency and injustice of the system of Excise, which the illicit trader easily evades; of the obstacles which it presents to economy and improvement in the manufacture, to competition with the foreigner and an extended export trade, which the cheapness and abundance of the raw material in this country would otherwise enable them to effect. He would not trouble them with reading other parts of their memorial, which ably argued their case, but pass to their conclusion, in which he was sure they would readily concur; namely, to repeal the duties upon soap, and in great part to replenish the Exchequer by an increased duty upon the import of “the great raw materials of soap, tallow and palm oil.” (*Cheers.*) It appeared that the annual pro-

duction of tallow in the United Kingdom was 100,000 tons, and the imports from Russia 50,000, on which there was at present a duty of 3s 4d per cwt., which it was proposed to raise to 10s, or 10l per ton. It might be urged that we must calculate on some decrease in the Russian supply, but he apprehended not; for independent of his belief that they had hitherto made far more exorbitant profits at their expense than the amount of the proposed difference of duty, he had recently been informed from a Russian correspondence, that not only were they largely extending and improving their flocks, but that in some of the more remote provinces, where religious tenets forbade their eating the flesh of sheep, they were grazed in large quantities for their wool and tallow only. (*Hear, hear.*) Now, it was gratifying to him to believe that the grazier might here find some relief, at all events a palliative, not only not at the cost of any other British interest, but to the positive gain of the community at large, of the lower classes in particular, and at a loss to the revenue so trifling in amount as compared with the advantage gained, that none but the most niggardly and perverse Chancellor of the Exchequer, and such he was sure their present one was not, could possibly refuse. (*Laughter and cheers.*) The consumer, in the first place, would save the whole of the soap duties, which amounted he believed to 650,000l, and 50,000l cost of collection. The additional tallow duty, letting alone palm oil, on the quantity now imported may be estimated to yield from 300,000l to 350,000l, and though this would be eventually paid by the consumer, he could not complain, for he would gain on soap what he lost on candles, and the consumer of both articles was one and the same person. To the extent of this latter sum the grazier would be benefited, and it was to this sum he called upon them to urge their claims by petitions to the legislature. Political Economists might rail at the false principles of taxing the raw material. If, however, they estimated those philosophers at no higher rate than he did, they might let that pass. (*Loud cheers.*) As for the foreign trade, he saw nothing so congenial in Russian policy, nothing so consolatory in a Russian tariff as to desire to sacrifice at its shrine the interests of the British grazier. (*Cheers.*) It was not very long since they enacted an import duty of 12½ per cent, aimed at British goods, and the ruin of many would bear testimony to their former exclusion of our refined sugars. As respected Great Britain, and he looked no further, it was but the transfer of a tax, and supported by them, he would, both in Parliament and out of it, do his utmost to force it upon the favourable attention of the Chancellor of the Exchequer. (*Cheers.*)

[*Speech of Sir R. Price at the Hereford Agricultural Meeting.*]

SIR R. PRICE rose, and said that he had attended most carefully to the petition, during the time it was being read, and must say that it was moderately and respectfully worded, and that he should with pleasure present it, and give it his best support; but at the same time, although he trusted something might be done for them by the legislature, yet he should be wanting in candour if he shrunk from stating to the meeting, that he did not anticipate that any great good could result from it; and as he did not look forward himself for any substantial relief from parliament, he would not hold out to them any delusive hopes, which would only induce the landlords to ask, and the tenants to promise, higher rents than could be afforded, and would thus greatly increase the embarrassments under which both parties at present laboured. He (Sir Robert) firmly believed, that no legislative enactments could effectually remove the grievances which oppressed the landed interest; they were beyond the reach of government; they (the agriculturists) must therefore look to other means to better their condition. He was sorry that one

part of the petition hinted that parliament had been negligent of the agriculturists; he declared that from the time he (Sir R.) had first a seat in the House of Commons, the then government, and every succeeding government up to the present time, whether composed of Whigs or Tories, had ever shown an anxiety to promote the welfare of the landed interest of this country. Every administration, he believed, had had the will, but wanted the power, to remove the depression which, from time to time affected the agriculturist. There had been committees appointed to inquire into the causes of distress, and the most diligent investigations had taken place. He admitted that much had not been done in the way of that relief; but some salutary measures had passed, such as the repeal of the duties on windows, affecting tenants who rented up to 200l per year, which shewed the anxiety of parliament to lessen the burdens of the farmer. Sir Robert commented at some length, on the state of the currency, from the passing of the Bank Restriction Act, which he characterised as an act of injustice to the creditor, to the time of Sir R. Peel's bill, which on the other hand he considered as a measure of great hardship against the debtor. He deprecated any new attempt to interfere with that very difficult and dangerous question, which, without effecting any permanent good, would have the effect of unsettling all contracts, and only lead to a repetition of the hardship and injustice which he had previously described. He believed if the present government remained in office, or Sir R. Peel and his adherents came in, that all parties were agreed that there should be no more tampering with the currency. [A person in the room put a question to Sir Robert, relating to the fundholders, and stated that the great fundholder did not pay his fair proportion of taxes.] Sir R. Price said, it was a mistake to suppose that the fundholders did not bear an equal share of the public burdens, and it was also a mistake to put them down as the most wealthy part of the community, when the fact was, that the majority of the fundholders were persons in the humble and middle classes of society, such as widows, orphans, old decayed and retired tradesmen, with small annuities, depositors in saving's banks, and members of benefit societies, whose hard earnings had been put out on the faith of public credit. He considered it would be gross injustice to tax those persons exclusively, and leave mortgagees and others to escape, who were receiving interest in full. With respect to the great question before them—agricultural distress—he considered it useless to disguise the fact, that it must be dealt with at home, they must forget war prices, and the landlord and tenant must come to an equitable arrangement. (This observation was received with vehement cheering.) Sir Robert proceeded and said, that though he believed that the only thing that could effectually remove the evils under which they then laboured, was a fair adjustment of rents, yet there were some measures within the reach of the legislature, the enactment of which would tend to better the condition of the farmer. There was one instance in which the legislature may interfere with effect. He wished to see settled on equitable terms the long agitated title question. He trusted he should not be misunderstood; he did not wish to cast the slightest reproach on the clergy. He believed the great majority of them had been moderate, and had not taken all to which they were legally entitled. It was the system of which he spoke, a system which not only greatly interfered with the proper cultivation of the soil, but, from the uncertainty of the title laws, occasioned innumerable disputes between those who ought to live on the best terms. On a slight misunderstanding between the parties, if there were the least feeling of ill-will, an exchequer process was almost the inevitable consequence, and the utmost precaution of the one party was scarcely sufficient to guard against such an affliction. (*Cheers.*) He assured the meeting, that in any measure brought before parliament, calculated to ameliorate the condition of the agriculturist, he should, while he had the honour of a seat in the house, be always found at his post, giving it his best and most cordial support.—(*The hon. baronet resumed his seat amidst general applause.*)

HEREFORD AGRICULTURAL MEETING.—The following is a copy of the petition agreed to at the meeting:—

*“To the Honourable the Commons of the United Kingdom of Great Britain and Ireland in Parliament assembled.”*

“The humble petition of the owners and occupiers of land, and persons interested in the prosperity of agriculture, residing in the county of Hereford.

Sheweth—“That your petitioners belong to the most numerous and most peaceful class of His Majesty's subjects. That their patience has been unexampled and distress unparalleled, and which is daily increasing. That no effectual means have hitherto been taken by parliament to ascertain the real nature, and cause of their distress, now of nearly twenty years continuance. That it is impossible that evils of the magnitude under which your petitioners suffer, can have arisen without an adequate cause. Your petitioners, therefore, earnestly entreat your honourable house, in no spirit of party, but in the spirit of consulting the country's best and most lasting interests, and in strict justice to British agriculture, ‘the first of all its concerns’ at once to institute (by means of a select committee, chosen from your honourable house,) a bold and unflinching inquiry into the causes of agricultural distress, with a view to their amelioration. And your petitioners will ever pray.”

### THE AGRICULTURAL INTEREST.

TO THE FARMERS AND LANDOWNERS OF THE COUNTY OF  
HEREFORD.

Gentlemen,—Feeling a more than ordinary interest in the welfare of that truly valuable portion of this great country, known as “The Agricultural Interest,” I cannot refrain, whatever motives may be attributed to me, whether of presumption or otherwise, from offering a few remarks upon the proceedings and opinions of those Gentlemen who addressed you at your meeting on Wednesday. In the first place, allow me to congratulate you upon the formation of the petition; and that the individual, or more, who framed it, showed a wise and sound judgment in avoiding any allusion to the currency question, although it was strongly urged by Mr. Smythies; nay he, in the fulness of his wisdom, boldly, and in the most unqualified manner, declared that to Peel's bill the whole of the distress you are now and have been suffering was to be attributed, and that the repeal would, without any other proceeding, not only rescue you from your present difficulties, but place you in the sunshine of prosperity. It is more particularly to remove such an impression from your mind, and to guard you against this dangerous but too plausible nostrum, that has induced me to obtrude myself. I will not disguise from you that it was Peel's bill tended very much to reduce the price of agricultural produce, but not to the extent that some persons suppose; the long war in which we were engaged, coupled with a combination of extraordinary circumstances, caused the produce of land, of whatever denomination, to reach the most extravagant prices: with the conclusion of that war, prices immediately declined, but not so in proportion did rent, tithe, and other local taxation. Well and justly then did Sir Robert Price, with a manliness which scorned popularity at the expense of principle, declare to you that Parliament had not turned a deaf ear to your complaints, but that for real and substantial relief you must “look at home.” What, let me ask you, but that ruinous rotten system of paper currency, created an artificial state of property and society? What generated the high prices of land, and raised up between you and your landlord a middle man who, to gratify his employer, too often made you a stepping stone to increase his wealth and gratify his ambition; and I look upon it as one of the greatest evils you have now to contend with is the baneful system now pursued by landlords, backed by these worthy land-agents, as they term themselves, of discarding

tenants who, with industry and capital are compelled, to save themselves from ruin, to ask an abatement of rent; the notice is received, the paid agent is applied to, and without further hesitation an assurance is given that another tenant can be met with who will gladly take it and require no reduction. If such is the case now, how much more so would it be if you had a debased currency; every landowner's agent would be then regularly besieged with paper adventurers, and each parish haunted by the voracious tithemen; rents and tithes would soon be increased in proportion to the value of the produce; you would rarely see a piece of gold; the substance would be vanished, and we should have the horrid scenes of the year eighteen hundred and twenty-five again enacted.

Mr. Smythies told you that the reason that the manufacturers were so flourishing was, that the cotton spinners could purchase the raw material for a bill at two months, which the seller could discount, and the manufacturer, after he had passed it through his loom, could again sell for another bill, which he could discount at his banker's, and thus pay the original bill; one more extraordinary light seemed to have burst upon this gentleman, for in his second speech he told you, that the artisan was buying for sixpence a loaf which cost ninepence in production. Why, gentlemen, until within a very short period there was not a bank in either Liverpool or Manchester that issued a note; if he is not disposed to take Sir Thomas Lethbridge's dogmas for axioms, I ask, is there any reflecting portion of the community who is disposed to pay him a greater compliment? Fine speeches and Latin quotations do very well for display, but they are ill calculated to point out what you want to know, viz. a remedy to an admitted evil. I would here implore you to weigh well, and receive with great caution anything, however plausible, that comes from any individual, I care not what or who he may be, calculated to create an unfriendly feeling towards your manufacturing countrymen; depend upon it you are both links of one great chain, and that your permanent prosperity is beyond all doubt unalterably interwoven; he who dares to throw the firebrand of discord is a decided enemy to both. Away then with this worse than ille cant! leave the manufacturers and their two months bills to themselves; be united, and seek a remedy where it is to be found; be prepared to point out to that committee which you have petitioned the House of Commons to grant you, the true source of the depression of the wheat markets; you will find it in the not over produce of Ireland, but in the misgovernment for years of that unhappy country, which compels its inhabitants to dispose of that produce which they are rendered too poor to keep for themselves; misery and starvation stalk through the land while every port in England and Wales is filled with its produce. Call then upon your Legislators to give that country, so long neglected, a well digested Poor Law. Call upon them to burst the bonds of a desperate faction, that spreads its baneful influence like a pestilence over her fertile plains, and demand with more than common firmness the adjustment of the Tithe question, both in Ireland and in the land of your birth. Look then “at home;” point out to your landlords the evil of turning out an industrious tenant, merely because he can obtain another; tell him, for he ought to be told, or he is not worthy to be a possessor of an estate if he does not listen to reason, that your successor must be in the same state as yourself, or he must work out and impoverish the land. Let landlords dispense, if not altogether, in a great measure, with theoretical agents; let him meet as his forefathers did his tenantry at the audit day, and cultivate that good feeling which ought to exist between them. Away with the visionary schemes of men who, to gratify their ambition, have purchased land, and borrowed money to pay for it, and who would hail with joy any measure that would enable them to screw out of the hard earnings of their fellow creatures the means of satisfying their grasping ambition. With every sentiment of sincere attachment to your interest.

I am your obedient Servant,  
RICHARD DAVIES, Hop and Seed Merchant,  
Hereford, December, 24th, 1835.

## AGRICULTURAL DISTRESS.

We believe it may be asserted with confidence that amongst those who look to the legislature for the relief of agricultural distress, the propriety of the course pointed out by the Marquis of Chandos is becoming daily more apparent; and the probability is that in the next session a committee will be appointed to inquire into the causes of agricultural distress. Assuming that such will be the case, it may not be uninteresting to advert to the committee which made its report in 1833, and to inquire what circumstances have transpired during the last two years and a half, to induce a hope that another committee, which must have recourse to nearly the same channels for information, shall be enabled to devise an effective remedy for the distress of the *tenant farmer*. A great outcry is raised against the Whigs as being hostile to the agricultural interest, and the Tories are pointed out as the only *true friends of the farmer*. To this, as part of a system of electioneering tactics, there may be no objection, as upon such occasions any means will be resorted to which may be calculated to prejudice the cause of an opponent. But the great object to be kept in view is to prevent the *tenantry* from being deluded into the belief that any particular set of politicians *can legislate* so as to improve their condition. For the information of such of our readers as may have forgotten them, we subjoin the names of the individuals constituting the committee of 1833, which concluded a report in the following terms, "In conclusion, your committee avow their opinion that hopes of melioration in the condition of the landed interest rest rather on the cautious forbearance than on the active interposition of Parliament."

Lord Viscount Althorp  
 Sir James Graham  
 Lord John Russell  
 Sir Robert Peel  
 The Marquis of Chandos  
 Mr. Littleton  
 Sir Richard Vyvian  
 The Earl of Ormelie  
 Sir John Sebright  
 Mr. Baring  
 Mr. Dominick Brown  
 Sir John Dalrymple  
 Mr. Cayley  
 Sir Matthew White Ridley  
 Sir Charles Lemon  
 Mr. Robert Clive  
 Mr. More O'Ferrall  
 Sir Edward Knatchbull  
 Mr. Ashford Sanford

Mr. James Buller  
 Mr. Wolryche Whitmore  
 Mr. Mathias Attwood  
 Mr. Bennett  
 Mr. Mildmay  
 Lord Viscount Milton  
 Mr. Bethell  
 Mr. Gilbert Heathcote  
 Lord Viscount Howick  
 Mr. William Denison  
 Mr. Childers  
 Sir W. Brown Folkes  
 Mr. Brigstock  
 Lord Henniker  
 Mr. Roberts  
 The Earl of Kerry  
 Mr. John Murray  
 Mr. Stanley (Cheshire)

These gentlemen, most, if not all of them, principally interested, and some to a very large extent, in the prosperity of the agricultural interest, after having sat for a very long time, having examined a great number of witnesses, to whom they put nearly 13,000 questions, arrived at the conclusion that little if anything could be expected from the active interposition of Parliament. We are sensibly alive to the benefits resulting from a good

understanding between landlord and tenant, and the advantages which will accrue from a union for their mutual interests. But it must be for their *mutual* interests. Nothing short of a determination upon the part of landlords to reduce their rents to such a level as will enable their tenants to live, can possibly maintain that union. An investment in land cannot be viewed in a different light from an investment in any other species of property, and if from any accidental cause the value of the property becomes deteriorated, it is the owner, and not the occupier who must suffer the loss. The committee of 1833, a committee of landlords, who may be said to have been sitting for the purpose of inquiring how they could best advance their own interests, inasmuch as any improvement in the condition of the tenantry must produce that effect, did not point out one single measure of relief which was not before well known to every man who had inquired into the subject. It is stated in the report that "the poor-rate is heavier, the county-rate is heavier, the highway-rate has increased; and the evidence would lead to the conclusion that the outgoings of the farmer are generally larger than he can afford to pay during the present prices of agricultural produce, without a sacrifice of the profit on his capital which he is entitled to realize." The *tenant farmer*, if fairly dealt with, should not suffer from the increase of the rates; instead of being taken out of the profit on his capital, they should go in diminution of rent, being imposts which deteriorate the marketable value of the estate, either for sale or for letting. It is the peculiar nature of the business of the farmer, whose return for the investment of capital takes four, five, or six years, as it may be, to realise, which places him at the mercy of his landlord. There is one passage in the report of 1833, the production of which alone is well worth the time devoted to the subject by the committee, and which embraces the principle upon which alone we rest any hope of relief to the tenant farmer. It is the following:—"In Scotland, where rent and wages of labour are the only outgoings borne by the tenant, the farmer, on the whole, appears to have suffered less than in England from the fall of prices; and *Corn Rents*, which have lately come into more general use in that country, protect the tenantry under lease from the effects of a falling market: but the labourer in Scotland being paid principally in kind, and receiving only a small portion of his wages in money, has not gained so much as the labourer in England by the altered value although his nominal earnings have not been much reduced." Rent and labour, the only outgoings borne by the farmer in Scotland, being the one altogether and the other principally paid in kind, of course vary in value as the price of corn does, but it does not require a *larger number of bushels* to satisfy the landlord's claim for rent or to meet the wages of the labourer, in one year than another. If the committee for 1836 will but

adopt this principle, and endeavour to devise some means whereby rents may be regulated according to the value of produce, and the outgoings in the shape of tithes and rates of every kind removed from the shoulders of the tenant, it will go far to restore the prosperity of the working agriculturists.

## AGRICULTURAL DISTRESS.

TO THE EDITOR OF THE HEREFORD TIMES.

Sir,—I read, in your paper of last week, a quotation from a communication which was sent by me to the Board of Agriculture in the year 1816; and I am in consequence led to address the following observations to you:—I was in London in the preceding year, where I found almost every person, with whom I conversed upon the subject, strongly impressed with an opinion, that the great and immediate depression then anticipated in the price of agricultural produce of every kind, would be highly and immediately beneficial to every class of society, exclusive of the land and title owner and farmer; and all were astonished to find that I entertained a widely different opinion. Government had, during many years previous to that period, expended annually an enormous sum of money,—the rents of the land and title owners had been very high,—the farmer had been living in affluence,—and his labourers had been well paid,—trade of every description had been apparently flourishing,—and an enormous amount of taxation had been levied without difficulty: when the farmer suddenly became incapable of employing his labourers, except at comparatively very low wages, or to meet the demands of the land and title owner; the shop of the tradesman consequently became, to a great extent, suddenly deserted; and the manufacturer, exclusive of the comparatively few who then worked for a foreign market, soon felt the ill effects of this state of things. A kind of general paralysis followed, and the country sunk, as I foresaw it would—and as I in my turn was surprised that others did not generally foresee—into a state of great debility: from that state it has long ago perfectly recovered, and the distress of the present period is much less extensive; and as far as the interests of the farmer are concerned, capable of being considerably diminished, though certainly not by any interference of the Legislature, except to a very small extent. The former may be, and I think ought to be, exempted from all expenses in the repairs of turnpike roads; and those who require roads, upon which they can travel ten or twelve miles an hour, ought to pay for the benefits which they receive. The tithes ought to be commuted; but I have too good reason to fear that strong opposition will be made to any proper change of the present tithe laws, though certainly not by the labouring clergy. Poor laws ought also to be introduced into Ireland, to defend the English labourer, both in agriculture and manufacture, from competition with the starving wretches driven by famine from that oppressed and most unhappy country. *But a reduction of the amount of payments now claimed by the land and title owner, proportionate to the decreased value of agricultural produce, can alone efficiently relieve the distresses of the farmer.*

To this point I wish particularly to draw the attention of those who in their public speeches have expressed so much regard for the prosperity of the farmer, and feeling for his sufferings.

It has been objected, and may be objected, that a great many landowners, many of whom have heavy mortgages upon their estates, cannot afford to reduce their rents. This is, I fear, but too true, and to a fearful extent amongst every class of landowners; but I do not think that such persons are very likely to extricate themselves from existing difficulties, by having their estates beggared by beggared and ruined tenants. Government have gone far in excluding all corn of foreign growth, except under a heavy tax, in the

opinion of many too low, for the protection of the interests of the landowner; though not a shadow of doubt exists, or ever has existed, in my mind, *that the operation of the Corn Bill has been highly injurious to the farmer, in having caused him to raise much corn which has not repaid his expenses, and for which the increased consumption of animal food and potatoes has greatly diminished the demand.*

The English farmer has now to contend with the Irish farmer, or, perhaps, more properly, with the Irish landowner, for he appears to take almost every thing which the soil produces, except a few potatoes. The soil of that country is generally fertile, and a vast extent of it, which has not yet been cultivated, is capable, with a proper outlay of capital, of being cultivated with advantage. The wages of an Irish agricultural labourer, who has the good fortune to find employment through nearly the whole year, does not exceed 7d a day, without any portion either of meat or drink; and so great a number are usually without employment, and ready to work at any price to escape starvation, that in an account recently published by Mr. Inglis, of a journey through every part of Ireland, taken with the view of obtaining correct information respecting the state of that unhappy country, he states that a person offered to find two hundred day labourers, who would engage to work for four-pence a day. I particularly recommend Mr. Inglis's work to the attention of your readers. His feelings towards the Roman Catholic religion and priesthood are evidently hostile, and he represents the latter as intolerant bigots; but he gives them credit for strict attention to their duties, and as liberal to the distressed poor. Mr. Inglis has the credit, which I think he well deserves, of having written impartially, and his work was recommended to me by a gentleman: he is a clergyman of the Established Church, and a Tory.

The exports, both of corn and of animal food, from Ireland are increasing with accumulating rapidity, and steam vessels convey its produce, at a very small expense, to those seaports of England, which have the most ready communication with the manufacturing and populous districts, where the English agriculturist has to contend, upon very unequal terms, with the Irish.

Under the preceding circumstances, what can Government do? Appoint a committee to enquire into the causes of agricultural distress, and cause a long and protracted discussion in the House of Lords and Commons; and thereby be enabled to obtain very correct information of that which every person of common sense and information already knows, that many landowners are distressed owing to having outlived their incomes, and that many farmers, who have been compelled to sink a part of their capital in payments to the land and title owners, have become poor and distressed. The recently formed Agricultural Association may possibly succeed in leading the public to believe that the present administration have neglected doing their duty, and thereby cause them to lose the confidence of the farmer and freeholder, and their places. Whether the country would or would not be benefited by this, is a question into which I shall not enter; but it is sufficiently obvious, that the formation of an association of landowners and farmers, for the purpose openly enough avowed by some of its members, of causing the price of the necessaries of life to be raised, and their own revenues to be increased, cannot fail to cause the formation of hostile associations amongst the inhabitants of the great towns and manufacturing districts, where inimical feelings towards the land and title owners are already more than sufficiently strong. The rival manufactories which are rising in different parts of the continent of Europe, preclude the possibility of the receipt of very high wages by the English manufacturer, who therefore cannot continue to compete with his foreign opponents, unless he can obtain the necessaries of life on nearly as advantageous terms. The operative manufacturer therefore cannot fail to view without very hostile and I cannot avoid thinking very just hostile feelings, the agricultural association; which appears to me much better calculated to cause a revolution, than to relieve the distress of the

farmer, who, whatever may be the price of agricultural produce, may be oppressed by a bad landlord.

Some of your readers may perhaps be disposed to ask me, what I conceive ought to be done? I would recommend others to do that which, I believe, I have found it my own interest to do; and as my tenantry have done. I employed, many years ago, a very able and eminent land-surveyor, Mr. Tench of Bloomfield, who possessed alike my confidence and that of my tenants, and who was previously well acquainted with my property, to say what amount of rent each farmer would be able to pay, consistently with his living comfortably and properly; and I authorised Mr. Tench to promise on my part, that if they would cultivate their farms properly and highly under his instructions, by raising abundant green crops, and sowing no greater extent of ground with corn than they could properly manure, I would make any amount of deduction from their rents, in the event of a decrease in the price of agricultural produce, which he should think equitable. My estates, have been, and are highly cultivated, and afford a much larger supply of animal food, and at least as much corn, though that is grown upon a much less breadth of tillage; my tenantry are, I believe, all doing well, and some of them, who have been active and economical, have, I know, saved a good deal of money, bad as the times have been; and taking into consideration the improved annual value of my property, I confidently believe that I have obtained greater pecuniary advantages, than I could have obtained by acts of rapacity and oppression.—Your obedient servant,  
T. A. KNIGHT.

Downton, Dec. 18, 1835.

### ISLE OF SHEPPY AGRICULTURAL SOCIETY.

This Society held their first meeting on Monday, Dec. 21, when nineteen ploughs contended for three prizes, in a field belonging to Mr. Thomas Coveney, Norwood Farm, Eastchurch. The Judges, Isaac Wildish, Jun., James Fullagar, and J. H. Smith, Esqrs., awarded the 1st prize of 4l to (No. 9), — Tappenden, the servant of Mr. Edward Swift, of Minster; the 2nd of 2l 10s to (No. 16), — Carpenter, the servant of Mr. Edward Bigg, of Eastchurch; and the 3rd of 1l 5s to (No. 1), — Hart, also the servant of Mr. E. Biggs. The others were much commended, as was a Scotch swing plough, sent by Admiral Fleming; with all, the contest was keenly contended. The 1st prize of 2l, for bringing up and weaning the greatest quantity of lambs, was given to — Hodges, the shepherd of Mr. Matson, of Eastchurch; and the 2nd prize of 1l to J. Whitehead, shepherd to Mr. Burford, of Minster; a prize of 2l was given to J. Atkinson, a labourer, for having been a member of a benefit society thirty-eight years; Wm. Mantle, labourer, a prize of 1l 10s for twenty-four years' servitude on one farm, under Mr. R. Foord, of Eastchurch; to Richard Kennett, 30s for having brought up, creditably, ten children, besides having lost several in infancy; Thomas Marrant, a single man, 1l, for fourteen years' servitude under J. Batchelor, Esq., of Queenborough; Mary Knapps, 1l, for thirteen years' servitude under Mr. Lester, of Shererness; and to Edward Cripps, aged thirteen years, 10s, for one year's servitude under Mr. Henry Pym, of Leysdown. There was no candidate for the girl's prize under similar circumstances.

THE DINNER.—About sixty gentlemen sat down to dinner; Delamark Banks, Esq., chairman, supported by Admiral Hon. C. E. Fleming, C. White, Esq., — Sackett, Esq., John Pratt, Esq., Thomas Burford, Esq., and many other respectable gentlemen; John Matson, Esq., officiated as deputy chairman. On the cloth being removed, the prizes were delivered to the candidates, they were suitably addressed by the chairman, and the secretary G. B. Chambers, Esq., who encouraged the unsuccessful to go on perseveringly, that they might be successful next year; which business being concluded, the Chairman gave "the King," "the Queen,"

"the Princess Victoria, and the rest of the Royal Family." The health of Admiral Fleming having been given with three times three cheers, he rose and acknowledged the compliment, by assuring the company of his anxiety for the prosperity of the society, which he was convinced, from personal observation in Scotland, was capable of, and would, he had no doubt, do a great deal of good. He begged to propose the health of their excellent chairman, with the honours he was so justly entitled to. The toast having been drank most cordially, the Chairman assured them they should have his continued support, and that he would do every thing in his power for the Isle of Sheppy, and he was convinced there was not a man in the island he could not call his friend. Messrs. G. Morrison, Sackett, G. B. Chambers, and many other gentlemen addressed the meeting, describing the benefits such societies had been productive of in other places, and urging its being well followed up here. Many excellent songs were sung, and the company separated at a late hour, much delighted with the proceedings of the day.

### THE CENTRAL AGRICULTURAL SOCIETY.

SIR—The formation of a central agricultural society, I certainly hailed as a blessing to the depressed agriculturists, and expected that they would go into parliament the next session, firm and united, but I confess I am much disappointed with the first meeting. I always considered the society to be organized, not to be the tool of this party of quacks, or that, but to concentrate and unite the opinions and influence of the agriculturists. But contrary to all sound policy—all the expectations entertained by the farmers, instead of simply asking for parliamentary inquiry into the cause of agricultural distress, they begin to discuss that cause themselves! I do not admire this uncalled for throwing down the gauntlet of discord, the very first meeting, I hope that the currency question or any particular view of agricultural distress, will never again be mooted there, or we shall be just where we commenced. That the agricultural interest is terribly depressed, there can be no difference of opinion, and no party in the House of Commons can refuse a fair inquiry into its cause, if we ask for it unitedly, and unconnected with any other opinion, or pre-considered resolution. If it turns out to be the currency, then let that alteration be steadily asked for, *but not till then*. To be useful, the inquiry must be a *local one*: the commissioners must *come to the farmers'*, and practical persons must be examined, in preference to theoretical, or the object of the commission will be defeated by interested persons, for the farmers are too much in the habit of setting still to go to any considerable distance. An opportunity should be given all practical persons by attending at the principal market towns, and they must *compel the attendance and evidence* of the farmer's, to render it at all useful. All the evidence that is offered must be received, come from what quarter it may, and I should like the labourers also to be examined. Let all throw their mite of information into the scale, and let the best be selected and promptly acted upon.  
Your's &c.

A YORKSHIRE FARMER.

Dec. 30, 1835.

I calculate that the milk and butter of a cow will pay the rent of three acres of land of average quality, and, if she can be supported upon half an acre, there will be then two and a half acres out of every three rent free for you to make the most on, with plenty of manure to cultivate them, besides any profit that may be derived from pigs, poultry, &c., and it is from fully considering this that I have repeatedly asserted that every tenant on these estates might, if they followed the instructions given to them have their potatoes, their grain, and their pork for themselves, in place of selling the two latter to pay their rent as they have heretofore in many cases been obliged to do.—*Essay on the improvement to be made in the Cultivation of Small Farms, by Wm. Blucker, Esq.*

## ON THE CAUSE OF ROT IN SHEEP.

By MR. WILLIAM HOGG, Shepherd.

*(From the Quarterly Journal of Agriculture.)*

For more than half a century I have been engaged in the management of sheep. During that period I have not been inattentive to the misfortunes, the evils, and the ailments to which sheep are liable; and, amongst the rest, the rot has not a little occupied my attention; and with the greater assurance I can point out its symptoms, its progress, and termination, as I resided a long time on a farm where it was the prevailing disease, and from which, all who were connected with the concern dreaded the greatest annual loss.

Diseases of every kind among sheep, are very often raised or invigorated by improper management, and none is easier brought into existence by harsh treatment than the rot. Hence, in many cases of this disease, it is difficult to determine whether it proceeds from the morbid qualities of the soil, or from some adventitious event in the animal's life. The case first laid down considers it as inherent in the pasture; the causes afterwards noticed, the exciting reasons which immediately bring it into existence.

As distinct families of this animal, for several descents, assume the same shape and figure, in so far as this disease proceeds from a particular formation of the system, it may be reckoned hereditary; but the force and freedom with which the lungs heave, is the surest criterion to determine the absence or presence of this disorder; but still the original or predisposing cause exists in the qualities of the pasture; it is this which marks the peculiarities of the constitution, gives that flow of spirits which actuates the animal, and adjusts every movement in the system.

I lay it down as a position which need not be doubted, that pastures abounding with soft grossy nourishment dispose to this disorder. Grasses of this description spring early, rank and juicy, are eagerly eaten at that season, when all other green herbage is absent; the scarcity of verdure, and its own succulence, induce sheep to eat it very close to the surface; the soil vigorous and strong, pushes constantly forward more of the delicious sward; yet till late in the season, it never attains luxuriance, as the pasturing stock constantly keeps it bare. Other grasses firmer and more consistent in the blade at last arise, but are coarser, and in proportion as they are so they are rejected, and the soft tathy verdure still constitutes the principal part of the food; the animal's taste by degrees is perverted, it can relish no other food than this raw watery sustenance, which imparts no consistence or vigour to the muscular and more essential parts of the body; and all its influence is directed to the increase of the viscera, and every inability arising from constant repletion.

The stomach and bowels increasing to an extraordinary bulk, become an unmanageable weight, too weighty for the constituent parts to carry about with ease, or with that facility necessary to its thriving, and by degrees the animal assumes a bad shape, that is, the belly and hind quarters become heavy and lumpish; the fore quarters, low, narrow, and contracted. The lungs are obstructed in their full play, and very often one of their lobes adheres to the ribs; this farther impedes their motion; at every respiration the cells of that master organ are neither sufficiently filled nor emptied; for want of vital air the blood is tainted,

every extraneous humour increases, a general debility prevails, and symptoms of the rot appear.

But feeding on raw immature sustenance to such excess, and so constantly as sheep once habituated to it ordinarily do, operates another way for the introduction of this disease; the fluid contained in the unripe food engenders a good deal of serum in the abdomen, and even diffuses it through many parts of the body, and this not being a natural fluid, farther debilitates the constitution. The animal now lounges about on soft tathy spots. Immediately that general waste of body falls into a morbid tumour under the chin; but this is a late symptom. A violent diarrhoea then appears, when the animal dies.

But feeding on such unwholesome grass, to the exclusion of every other kind of food, always confines the animal on such low damp spots as produce it; while at every inspiration plenty of rank miasm is drawn in, which settles in the lungs, and loads their cells with a phlegmy viscid matter, which, with difficulty, is coughed up, especially when the animal is excited to motion. A consumption is then completely formed, for which as far as I know, or ever observed, there is no cure.

The softness and immaturity of the grasses, upon which the animal feeds, is the predisposing cause to this disorder: but where this is unaided by any accidental cause, though it has for a long while been preparing the system for the reception of this disorder, yet has as yet been unable to give existence to the disease itself, till some exciting cause occurs, which directly fixes it in the constitution; and this exciting cause proceeds either from the severity of the seasons or improper management.

It would be tedious, and in several cases almost impossible, minutely to explain how such a cause operates to produce this disorder; but it must be understood, that a certain degree of force or energy in every sheep's constitution is necessary to keep the functions of life moving in a healthy orderly manner; but when the regular operation of these is any ways impeded, by any cause whatever, the rot on soft tathy pastures is always the consequence. I shall briefly mention those belonging to the first class, viz. unpropitious seasons—heavy and protracted storms of snow—rapid transitions from frost to fresh, and *vice versa*. Hence the old adage—

“Mony frost an'mony thowe,  
Make mony weary rotten ewe.”

Wet seasons, especially wet autumns—immoderate falls of rain, cause drains, cleughs, and burns to overflow their natural boundaries; in such places, the soil never omits to send up a hasty flush of new grass, which is particularly detrimental to the health of the pasturing stock—a new braid of grass rising late in the autumn, or on fat places, even in the month of December. This also has a bad tendency, for it sinks the animal spirits.

The exciting causes of the rot from rude and ungentle usage may be classed as follow:—An immoderate heat, often got by severe dogging; I have several times known the lamb get this improper treatment, yet the constitution struggles on for three or four years, and yields to the rot at last—too long indulgence on flat grassy pasture which has been recently flooded—grazing on land which has been formerly, or is at the time, pastured by cattle. The rank grass of a deep green colour, springing from the spots on which they drop their dang, is vastly deleterious, as is also that kind which rises round the borders of

their foot-marks, after being soaked with stagnant water. This last cause affects not individuals, but whole parcels; and in general any misfortune or slight disease, which has for a while interrupted the animals thriving on all soft tathy pastures, is almost sure of introducing the rot.

I have read of instances, which were said to be well attested, of sheep rotting very hastily when transferred from their native hills in Scotland to rich English pasture. Except bad usage when taking them up, I can think of no other cause that can satisfy myself for this rapid waste of constitution; but let it always be remembered that a severe heat, which is often accompanied with other base usage, will break up the soundest constitution, especially at that important crisis, when it is removed to a pasture quite different in its qualities from that on which it was bred.

I have only to remark on this part of the subject, that the predisposing cause, by its long and uninterrupted influence, may produce this disorder; but its existence as a disease is oftener begun by the intervention of auxiliary causes.

The seeds of the disease may have struggled with the constitution for some seasons, but when the following external symptoms are exhibited, it is a plain declaration that all the ingredients necessary to constitute the rot are condensed and formed into disease, and that death will immediately ensue. I shall mention them in the order in which they generally appear.

About the latter end of February or beginning of March, the wool loses its healthy brown colour, becomes bleached and dead-like; then follows considerable prostration of strength; late in leaving the tathy spots, and early on them next morning—probably would not leave at all if not urged away by the shepherd; falls always back in the ranks when the shepherd moves them forward; a sullen, lustreless eye, looking steadily at the shepherd; an œdematous swelling under the chin. This last is a late symptom.

When dissected, the internal symptoms are; Lungs entirely wasted, often hanging like empty bladders to the base of the *trachea*; in some cases, when not so much wasted, the interior of each lobe full of tubercles; liver, in all cases that ever I saw, increased to an extraordinary weight and size, studded all over with hard white spots; cut any of its ducts, and the flukeworm issues out by hundreds, immersed in a bilious-like liquor. Several of this insect are also to be seen distributed among the other viscera; but I never saw them within any but the liver. These creatures I consider as the consequence, not the cause, of the rot; for they also exist in the livers of healthy sound sheep. Besides, the *fasciola*, of which this is a variety, is peculiar to the intestines of other animals; but their extraordinary increase, in cases of this kind, is no doubt owing to the diseased state of the liver, in which they multiply to such immense numbers, and their multitude and activity in it diminish the strength, and accelerate the death of the animal. In the quantity of tallow there is not much decrease, not near so much as the extreme debility before death would seem to announce. That which wraps the stomach and kidneys, as well as the fat dispersed through the system, has lost its suety qualities, and become a tough yellowish-coloured substance, altogether infusible by heat; in some more, in some less, but always a quantity of serum loose in the abdomen, in which the bowels float. Over the carcase are sundry yellowish spots, which are not unfrequent where fat should exist.

Excess of fluid existing in those varieties of grass,\* which the animal selects for its food, and a deficiency of those firm consistent varieties,† which are peculiarly adapted for strengthening the stomach, for animating and establishing the muscular system, I take to be the radical cause of this disorder; yet secondary or exciting causes may operate with such force and vigour as to unhinge the best constitution, and dissolve the best constructed parts, and, when this is done, the rot is always the consequence.

CHEESE.—MR. EDITOR,—For thirty long years have I been a dairy farmer, and nothing has so much surprised me as that people should have been so long finding out the real nature and poisonous quality of the ingredient commonly called Annatto, which is used to redden cheese. It is a fact known to most cheese makers, that the original intention of colouring cheese was to disguise its real quality: and it is all very well for those who cannot make good cheese, to use this stinking stuff, in order that one bad smell may counteract the other. All real good dairies of cheese are best when in their pure and unalloyed state—perfectly white—alike free from smell or colour. I have always been in the practice of making part of my dairy white and part coloured, but my dealers invariably tell me the white is best; yet, such is the force of custom or prejudice, that red cheese is still preferred in many places to white. It is pleasing to find, however, that where white cheese has been once introduced it is always preferred. I recollect reading, in my younger days, of one of the Spanish monarchs, who was ever so fearful of being poisoned, that he accustomed himself to taking a daily potion (in order to prevent the operation of a single dose of poison,) for so long, that at length he could not live without it. Will the cheese eating community take the hint?

A FARMER.

\* Among the kinds of grass which peculiarly dispose to this disease, may be mentioned the several kinds of meadow-grass, woolly soft grass (*Holcus lanatus*); but it must be recollected that those grasses are more or less noxious in proportion to the wetness of the season, or to the frequency with which they have been inundated by water; for this element, in its purest and most simple state, leaves a deleterious deposition in the grasses over which it floats. This is neither a sediment, nor, as far as the human sight can judge, can it be called an impurity. It is a very fine transparent colouring, nearly resembling the cobwebs which float through the air on a fine autumnal day. It was known, as well as its poisonous effects on sheep, to our forefathers, by the name of *Lace*. I have often noticed this sparkling appearance by the sides of wells, whose waters were newly emitted from the interior of the hill; and I once knew of a sheep which habituated itself to such unwholesome food completely rotten at a year and a half.

† That species of feeding which imparts a sufficient flow of spirits to the animal's consistence and activity to those parts adapted for motion, are the different heaths, ling, deer-hair, all the varieties of bent, &c. A due proportion of these, eaten along with soft and often unripe grasses, accelerates the digestion of every day's food, checks the preternatural increase of the viscera, and opposes the generation of vicious humours through the whole system.

### THE LATE SIR JOHN SINCLAIR, BART.

We cordially embrace the opportunity now afforded us to pay a tribute of respect to the memory of a fellow-citizen, so distinguished for his public services, so estimable for his private worth.

Sir John Sinclair was born at Thurso Castle, in the county of Caithness, on the 10th of May, 1754. He received the rudiments of a classical education at the High School of Edinburgh, and having carried on his studies at the Universities of Edinburgh and Glasgow, he completed them at Oxford. At Glasgow he was a favourite pupil of the celebrated Adam Smith, who admitted him to familiar intercourse, and from whose conversation, as well as lectures, he imbibed a taste for political inquiries.

On the two first occasions which called forth his talents as a writer, his object was to rouse the sinking energies of the country in times of great disaster, and embarrassment. At the close of the American war, the suspicion rapidly gained ground, under the influence of Dr. Price and Lord Stair, that the finances of the country were embarrassed beyond recovery, and that a national bankruptcy was inevitable. In reply to this dangerous assertion Sir John wrote a tract entitled *Thoughts on the State of our Finances*, which essentially contributed to restore the credit of Great Britain on the Continent. It "deserved letters of gold" was the strong language of the British Minister at the Hague, to express his sense of its importance. In 1780 Sir John wrote his vindication of the British navy. No great victories had for a long period been gained at sea, and so general was the panic spread by the expected junction of the French and Spanish fleets, that even Lord Mulgrave, though a Lord of the Admiralty, was understood to have been carried away by the torrent of despondency. In a pamphlet entitled *Thoughts on the Naval Strength of the British Empire*, Sir John Sinclair so effectually revived the public confidence, that Lord Mulgrave himself returned him thanks for a defence of our naval service so powerful and so well timed.

It was in the same year, 1780, that Sir John was first chosen to represent his native county: and, with the exception of a short interval he continued in the House of Commons till the year 1811, a period of above thirty years.

During a visit to the continent in 1785-6, Sir John's activity and perseverance enabled him to obtain information upon several points of great national utility; in particular on the art of coinage and on the manufacture of earthenware and of gunpowder. He described the last of these improvements to his friend Bishop Watson, Professor of Chymistry at Cambridge, before communicating it to the Board of Ordnance; and so important was the service rendered to the public, that the bishop in his memoirs represents his subordinate share in the transaction amongs this strongest claims to public gratitude.

Among the earliest and most laborious of Sir John Sinclair's literary undertakings was his *History of the Public Revenue, from the Remotest Eras to the Peace of Amiens*—a work which supplied the necessary data for effecting various improvements in our financial system, and especially for the introduction of the income-tax, without which the war could never have been brought to a successful issue.

It was on Sir John Sinclair's suggestion, that in 1793 Mr. Pitt proposed in Parliament the issue of Exchequer-bills for the relief of the commercial interest, then labouring under great distress. How soon and how effectually credit was restored by that politic measure, all merchants old enough to recollect the crisis must willingly, and many of them gratefully, acknowledge. Nor was Sir John's diligence in executing his plan inferior to his sagacity in devising it; much depended upon a large sum of money reaching Glasgow before a certain day; by applying every stimulus to all the agents he was enabled to accomplish this important object, contrary to the expectations of his most sanguine friends. Meeting the Prime Minister the same evening in the House of Commons, he began explaining to him his success, when Mr. Pitt interrupted him—"No, no,

you are too late for Glasgow; the money cannot go for two days."—"It is already gone," was Sir John's triumphant reply; "it went by the mail this afternoon." When the panic was over, he proposed to Mr. Pitt that immediate measures should be adopted for preventing the recurrence of the same disaster, and that the whole of our banking system should be reconsidered with a view to stop the over-issue of paper money, which he foresaw as the consequence of the Restriction Act. Mr. Pitt replied, that other subjects then required his whole attention; and thus, in spite of warning, the depreciation of the currency was suffered to proceed unchecked and uncontrolled.

The gratitude of the Minister was in proportion to the magnitude of the service. He desired Sir John to specify some favour to be conferred upon him by the Crown. Here was a valuable opportunity for gratifying personal interest or family ambition, but the boon which this true patriot solicited was a benefit to his country; he requested the support of Government to his intended proposition for the establishment of "a Board of Agriculture."

Over this great national institution of which the farming interest justly designate him "the founder," he, without emolument, presided for many years. To the exertions of the board this country is indebted, in a great degree, for its rapid progress in the art of husbandry. A spirit of enterprise and of invention was excited among the farming classes, and a dignity attached to agriculture which it never had before acquired. Agricultural associations suddenly sprung up on every side; reports were published, in fifty volumes octavo, describing accurately every county in the United Kingdom, and the substance of the information thus accumulated was digested, by Sir John himself, into his *Code of Agriculture*, a work which has now reached the fifth edition, has been reprinted in America, and translated into all the chief languages of Europe.

To illustrate the degree of energy diffused among the owners and occupiers of land by the labours of the Board of Agriculture, it will suffice for us to state, that during twenty years prior to the establishment of the board, though peace and war, prosperity and adversity, had alternately prevailed, the number of enclosure bills was only 749, whereas during the twenty years subsequent to its formation the number amounted to 1,833, giving an increase of 1,134 bills, or, according to the best calculations, 2,268,000 acres of additional cultivation. The necessity for these numerous and expensive bills might have been prevented by one comprehensive enactment, and Sir John at one time was able to inspire the two rival statesmen of those times with such a portion of his own zeal for agricultural, that both of them promised if the other consented, to attend a committee, of which Sir John was to be chairman, for the arrangement of a general enclosure bill. This was perhaps the only instance in which those inveterate opponents were prevailed upon to combine for one object. Unhappily, after the whole plan had been matured, Mr. Fox was persuaded by his friend Burke to withdraw his consent, and thus was frustrated a scheme of public usefulness at the only time when it appeared likely to succeed.

Among the labours undertaken by Sir John Sinclair, the most arduous, and perhaps the most successful, was *The Statistical Account of Scotland*. So little had the subject been at that time attended to, that the very term "statistics" was of his invention (see *Walker's Dictionary*.) No word then in existence could adequately express his practical adoption of the great Roman statesman's axiom, "Ad consilium de republica dandum, caput est nosse republicam." The work was first commenced in 1790; it was prosecuted uninterruptedly for seven years, during which a correspondence was carried on with all the clergy of the church of Scotland, amounting nearly to 1,000; and it was brought successfully to completion by the gradual publication of twenty-one thick octavo volumes, in which a separate account is given of every parish in North Britain. Attempts have been made in various parts of Europe, in Spain (1575), Sweden (1630), Germany, England, and especially in France, both under Louis

XIV., and even under the auspices of the Emperor Napoleon, to produce a work of the same kind, but nowhere hitherto with the least approach to the same success. Hence the celebrated Comte Haubrive, in his *Elements of Political Economy*, affirms, that "Scotland is the country in which the spirit of statistical research has been brought the nearest to perfection." The services of the Scottish clergy on this occasion were so strongly represented to the Crown by the honourable, the candid, and high-minded originator and conductor of their labours, that a royal grant of 2,000*l.* was presented to the society for the benefit of their families; and Parliamentary assistance to a large extent was afforded them for the augmentation of small livings. Sir John made no attempt to derive even a partial compensation by the sale of his performance, for the immense expenditure he had incurred, but generously made over the whole work to the abovementioned body. A new edition, under their direction, is now in progress. Let us hope that in the latter parts of it those acknowledgments will be made to the father of statistical philosophy which have hitherto been unaccountably withheld. We may remark that the successful efforts of an individual to anatomize society formed Lord Colchester's chief encouragement to propose that great national undertaking—the general census.

Along with his agricultural and statistical inquiries Sir John Sinclair from time to time exerted himself for the extension of the British fisheries. Having reason to believe that large quantities of herrings annually resorted to the coast of Caithness, he advanced a sum of money towards enabling certain enterprising individuals to decide the question. Their report was so favourable, that he prevailed upon the British Fishing Society to form a settlement in that country. In proof of his own disinterestedness, it may be noticed, that he made choice of a situation at a distance from his own property, and from which he could derive no personal advantage. By his exertions, also, a grant was procured of 7,500*l.* from the forfeited estates of Scotland towards the construction of a harbour in the Bay of Wick, where fishing vessels might receive protection. The fishery thus established and encouraged has ever since continued rising in importance. It employs, on the coast of Caithness alone, about 14,000 individuals; it produces annually above 150,000 barrels of herrings; and being since extended to the neighbouring country, has become the most productive fishery in Europe.

The more elderly friends of Sir John Sinclair will well remember seeing him, a tall athletic figure, in a military garb. His pretension to that costume was grounded on an important benefit to the public—that of raising, in 1794, a regiment of fencibles. Corps of that description were in general restricted to the defence of Scotland; but Sir John's first battalion, consisting of 600 men, served in England also; and the second, 1,000 strong, in Ireland. The latter corps furnished above 200 volunteers for the expedition to Egypt.

Among the measures recommended by Sir John Sinclair in Parliament, he always himself attached peculiar value to the grant for forming bridges, roads, and harbours throughout Scotland. The success of that measure may be attributed to a suggestion made by him, that no assistance should be granted by the public except in cases where the private parties interested became bound to pay one-half of the expense. It may be mentioned, to the honour of the Lord Register (Mr. William Dundas,) that although he moved in the House the appointment of a committee upon the subject, he uniformly attributed the "whole merit of that noble work of improvement to the right hon. baronet with whom the idea had originated."

To the other public services of Sir John Sinclair may be added, that he originated and long presided over the Society for the Improvement of British Wool, and introduced, at his own risk, into the north of Scotland, the Cheviot breed of sheep, of which so many millions have, in consequence, pastured on our Highland hills; that, by his speech and pamphlet in answer to the Bullion Committee, he prevented, during war, those embarrassments in our finances which it was afterwards admitted must inevitably have resulted from the pro-

posed return to cash payments; and which he constantly maintained would not only be destructive during war, but most impolitic and injurious even in time of peace, being thus as much opposed to the ruinous enhancement, as he had before been to the alarming depreciation of money; and lastly, that he suggested in the House of Commons the appointment of a committee on the famine in the Highlands, and by prevailing on them to waive the want of precedent, and grant relief without delay, he was the means of saving thousands from starvation.

The value of the various services above enumerated has been acknowledged from all quarters by the most competent judges. King George III. honoured him with friendly notice and correspondence, conferred upon him the dignity of a privy councillor, and is understood to have intended for him further marks of Royal favour. Various agricultural associations presented him with pieces of plate. Out of thirty-three counties in Scotland no less than twenty-five voted him their thanks. The magistrates of Thurso, the town adjoining his own residence, publicly and gratefully acknowledged "that amidst other pursuits of a more extensive tendency, the improvement of his native country had been the peculiar object of his care and attention;" and the freeholders of Caithness passed resolutions thanking him for having brought to a completion measures "which laid a solid foundation for the future prosperity of the county."

The reputation of Sir John Sinclair is not only British, but in the strictest sense European. Diplomas have been presented to him from societies, philosophical and agricultural, to an extent almost without example. They amount in all to twenty-five.

We have spoken of Sir John Sinclair as our fellow-townsmen, because his latter days have been spent among us in literary retirement. Occasionally he addressed the public upon subjects of political discussion, but his time was chiefly occupied in the intercourse of domestic life, or in preparation for a work which he had long projected on religion. He was of opinion that a treatise by a layman on the evidence of Christianity would be more favourably received, both at home and abroad, than the performance of a clergyman, and he resolved that, as his long life had been spent in the service of his country, his latter days should be devoted to his Redeemer and his God. In the work thus piously projected and zealously prosecuted he had made considerable progress, but its completion was anticipated by death. *Talia agentem atque meditantem mors prevenit.*

The funeral of the venerable baronet took place within the chapel of Holyrood Palace, on the 30th of December, and although it was the wish of the family that the ceremony should be strictly private, yet the Lord Provost, magistrates, and Town Council, in their robes, and a deputation from the Highland Society of Scotland, of which Sir John was a distinguished member, solicited permission to join the procession on its entering the precincts of the palace, an unexpected tribute of respect which the friends of the deceased, we believe, did not decline, and which strongly marks the feeling which his loss has occasioned in the metropolis of Scotland. Sir John is succeeded in his title and estates by Sir George Sinclair, the present member for Caithness.—*Edinburgh Advertiser.*

**CHURCH PROPERTY.**—Until a very few years ago, the entire parish of Wivliscombe, in Somersetshire, consisting of between 8,000 and 9,000 acres of good land, belonged to the bishoprick of Bath and Wells, and constituted the *far greater portion* of the revenue attached to that See. The late Bishop let the whole of the said property to his son for a term of three lives, at a *nominal* rent. The present Bishop, finding his revenue reduced to a mere trifle by this proceeding of his predecessor, agreed to make over the property *in fee* to the late Bishop's family, on condition that 40,000*l.* in money should be settled on the bishoprick; and an Act of Parliament passed through an **UNREFORMED** House of Commons and a **Tory House of Lords** enabling the parties to fulfil this engagement.—*Chronicle.*

EDUCATION AND CRIME.

The annual meeting of subscribers, teachers, and scholars of Friar's Mount Sunday School, took place at that establishment, in Church-street, Bethnal-green, on Monday evening, Under-Sheriff Pearson in the chair.

Several youths who are receiving education at the institution recited Scriptural and moral pieces with great effect, and particularly five boys, who had committed to memory, and who spoke large portions of the dialogue from "Pilgrim's Progress," with an emphasis and propriety which would have reflected no dishonour upon the scholars of half the boarding schools in London.

Mr. EDWARD WENTWORTH, the Superintendent of the school, gave a long account of its progress, from the time of its formation in 1804, by the Chairman's father which, on account of its simplicity, deserves to be recorded. From his statement it appeared that since its institution upwards of 20,000 Sunday school scholars had received their education there, besides 4,000 daily scholars, and that it had given birth to another establishment in the neighbourhood, which in 17 years, had received 14,000 Sunday and 3,000 day and infant scholars; so that since the late Mr. Pearson had reared Friar's Mount School, it had given the blessings of education to upwards of 40,000 of the youth of both sexes. There was still in the school above 1,300 children, who received their education at the hands of gratuitous teachers, and at an annual expense of 150*l.* (*Applause.*) Mr. Wentworth proposed a vote of thanks to the chairman.

Mr. PEARSON stated that to find himself, after so many years' absence, in the room where he had often assisted his late father in extending the blessings of education to the youth of that poor and populous district, raised emotions which he could scarcely describe. His attachment to the institution of Sunday schools was with him of so early an origin, that it must almost be termed one of the instincts of his nature; but his subsequent experience in life, so far from weakening the impression, had only convinced him, that of all the charities which adorned this charitable nation, Sunday schools were the most important, realizing the very characteristic of mercy, and blessing alike, those who gave and those who received. A great outcry had of late been raised in consequence of what had been termed the enormous increase of crime in the nation.—(*Hear, hear.*) He was sorry to find by the printed evidence taken before the committee of the Lords, that even the respectable chaplain of Cold Bath-fields prison was disposed to take a gloomy view of the influence of education upon the humble classes. It was true he drew a distinction between education which did, and education which did not inculcate good principles, but he (the chairman) contended that education in itself prepared the mind for the reception of good principles; and if the reverend chaplain had followed out his calculations to their natural results, he might have shown that though the quantity of education which he ascribed to the criminal population of the metropolis might not be sufficient to fortify them against the seductions of crime, it formed an excellent soil for the discipline and admonition, and instruction and reflection of a gaol to work upon; and that although the temptations from without might for a time overcome the power of resistance, yet, the "still small voice" of conscience lived within his bosom, and, exciting a determination to reform, exempted him from a recollection of crime, to a much larger extent than was the case of the brutally ignorant and uneducated part of the community.—(*Hear, hear.*) The evidence of the chaplain stated that out of 967 prisoners he examined in 1834, of those uneducated—i. e., not taught to read and write—

First imprisonment. . . . .	58	} 104
Second imprisonment. . . . .	46	
Those who could read and write—		
First imprisonment. . . . .	646	} 863
Second imprisonment. . . . .	217	

So that while 44 per cent. of the entirely uneducated criminals returned to the commission of crime, and were subjected to second imprisonment, only 25 per cent. of such criminals as could read and write returned again to the gaol; thus giving a balance of 19 per cent. in favour of the reformation of even the partially educated over the entirely uneducated portion of criminal society. In the progress of his official duties as Under-Sheriff he had had occasion to investigate the proportions which education and crime appeared to bear in relation to each other, and the statistical returns submitted to Parliament appeared to sustain some extraordinary inferences, showing that education, particularly Sunday school education, had considerable influence in diminishing crime where that species of instruction most generally prevailed. He was aware that arguments deduced from statistical tables were calculated to mislead unless carefully watched, and these tables, compiled as they were from returns made at different periods, must be rather taken as an approximation to accuracy than as an authenticated calculation upon which implicit reliance might be placed. Mr. Pearson then read the following statement:—

Wales . . . . .	England . . . . .	Middlesex . . . . .	York . . . . .	Lancaster . . . . .	Population in 1833.	Youth of both sexes from 5 to 15 years of age.	Number of day Scholars.	Number of Sunday Scholars.	Total of day and Sunday Scholars.	Proportion of persons committed for offences to the Population.
830,000	13,481,000	1,398,000	1,410,000	1,345,000		199,000	52,000	175,000	226,000	1 in 2,255
		335,000	338,000	322,000						
		92,000	112,000	91,000						
		1,375,000	1,77,000	198,000						
		2,510,000	289,000	289,000						
		1 in 681	1 in 998	1 in 572						

From the foregoing table it would appear that in Middlesex, where the proportion of crime to the population was greatest, the proportion of education to the juvenile population as related to two other counties of nearly similar population, was less than half. In Middlesex the proportion of crime to population was nearly double that of the rest of England, while her proportion of education to the juvenile population was less than one-half; and as to Wales there was scarcely a child in the principality without the means of education, and the proportion of crime in that country was out of all proportion small as compared with the nation at large. He then dwelt at great length upon the peculiar advantages of Sunday schools in large manufacturing and trading towns and cities. Mr. Cotton, the Ordinary of Newgate, who had filled that situation upwards of 20 years, had in conversation that day informed him that he kept a register of all the young offenders who entered the gaol of Newgate, and the re-

sult of strict inquiries enabled him to say that almost an incredible small number of children from Sunday schools were committed to that gaol, very much less than the proportion which those schools bore to the juvenile population of the metropolis. This afforded great encouragement to those who were engaged in the work to extend the sphere of their exertions, and would, he trusted, hold out an inducement to the Philanthropist to aid the benevolent and useful undertaking. It was a disgrace to the metropolitan county, the residence of Royalty, the seat of Government, the emporium of commerce, the residence of the noble and the rich, to give Sabbath instruction to no more than 52,000 children out of a population of 1,300,000, while with the same population York had 177,000, and Lancaster 198,000 scholars; and the poor, but virtuous principality of Wales, with scarcely more than double the population, maintained more than three times the number of Sunday school scholars in the metropolitan county. (*Cheering.*)

A subscription was then entered into by the visitors, and the meeting broke up.

### TITHES.

The following circular has been just issued from the Home-office, with the view, we conclude, of obtaining information for a measure to be brought forward in the approaching session. We have thought it right to publish the description of the information sought, as it may form in some degree an index to the character of the measures contemplated. It seems, however, next to impossible that any plan can be properly digested in sufficient time to be laid before parliament, and carried through, the rough materials of which are yet to be collected.

"The favour of an answer is requested to the following queries, which answer you will please fill in, in the columns on the other side, according as the tithe is taken in kind, or compounded for on view of the crop just before harvest; or compounded for by a money payment per acre; stating whether let on lease, and for what term, or only compounded from year to year. And if any part is subject to a modus, or composition real, or prescriptive payment, you will be pleased to state the quantity and culture of land so subject, and the amount per acre, under the proper column.

"1. Quere. The county in which the parish or estate is situate to which these queries apply.

"2. State the name of parish, and name and distance of market-town usually frequented for sale of produce.

"3. State how many acres does the said parish or estate contain, distinguishing the numbers of acres of arable, meadow, pasture, or sheep-walk, and wood land.

"4. Is the parish or estate the property of a lay or ecclesiastical proprietor?

"5. State, under the appropriate head on the other side, whether the tithe is taken in kind, or compounded for on view of each crop every year, or compounded for by an annual average money payment, or by a corn rent; and state, in either of the two last cases, whether on lease, or the payment varied from year to year.

"6. In the first case state the amount of average market value of the tithe so taken in kind during the last seven years, without any deduction whatsoever.

"7. State the scale of prices at which the above value is calculated.

"8. State whether the whole parish or estate is subject to rectorial and vicarial tithes, and if to vicarial tithes, state the amount in value of each description separately, and (if any) the quantity and

culture of land subject to any modus, composition real, or prescriptive payment, and the amount of any such payment per acre.

"9. If the tithe is taken in kind, state the expenses of collecting, thrashing, and carrying the same to market.

"10. State the amount of all rates and taxes to which such tithe is subject; and the two sums referred to in Nos. 9 and 10, when subtracted from the marketable value of the tithe, will give the net value of the tithe.

"11. If compounded for on view of each crop, state the average annual value of the whole of the produce during the last seven years, without any deduction whatsoever; and also the prices on which each value was calculated; the amount of such composition for such description of land, and whether the same has been made subject to rates; and if so, state the amount of such rates, which, deducted from the composition, will give the net value of the tithe. If you cannot answer such question in detail, give the whole composition.

"12. If under composition by a money payment, or on a corn rent for several years, or from year to year, state the amount of such composition, when such composition was made, and for what term.

"13. What was the scale of prices on which such composition was calculated?

"14. Is such composition received clear of all rates, or subject to them? and if the latter, state the amount of such rates, and the net value of such composition received by the tithe-owner."

CONSUMPTION OF FOOD, &c., IN LONDON.—The consumption of animal food in London is very great; but, to form a proper idea of its extent, the average weight, as well as the number of the animals, must be ascertained. About the year 1700, the average weight of the oxen sold in the London market was 370lbs; of calves, 50lbs; of sheep, 28lbs; and of lambs, 18lbs; the present average weight is, of oxen, 800lbs; of calves, 140lbs; of sheep, 80lbs; and of lambs, 50lbs. The number of oxen annually consumed in London, has been estimated at 110,000; calves, 50,000; sheep, 770,000; lambs, 250,000; hogs and pigs, 200,000; besides animals of other kinds. Smithfield is the principal market for the above articles; and the total value of butchers' meat sold there annually, is stated at 8,000,000*l.*—The quantity of fish consumed in the metropolis is comparatively small, on account of the high price which it generally bears; but this will probably be remedied, though some kinds of fish, at particular seasons, are cheap and of good quality. There are, on an average, annually brought to Billingsgate-market 2,500 cargoes of fish, of forty tons each, and about 20,000 tons by land carriage; in the whole 120,000 tons. The supply of poultry being inadequate to a general consumption, and the price consequently high, that article is mostly confined to the tables of the wealthy. Venison is sold chiefly by pastry-cooks, at a moderate rate, but the chief consumption, which is considerable, is among the gentry and proprietors of deer-parks. The annual consumption of wheat in London may be averaged at 900,000 quarters, each containing eight Winchester bushels; of porter and ale 2,000,000 barrels, each containing 36 gallons; spirits and compounds, 11,000,000 gallons; wines, 65,000 pipes; butter 21,000,000 lbs; and cheese, 26,000,000 lbs. The quantity of coals consumed is about 1,200,000 chaldrons of 36 bushels, or a ton and a half to each chaldron. About 9,600 cows are kept in the vicinity of London for supplying the inhabitants with milk, and they are supposed to yield 7,900,000 gallons every year; even this great quantity, however, is considerably increased by the dealers, who adulterate it by at least one-fourth with water before they serve their customers.

## DRAINING.

We mentioned in our paper two weeks ago, that a process of draining, by means of tapping or boring, was being carried into effect upon the lands of Rotchell, in the immediate neighbourhood of this town, which, in our opinion, was well worthy the attention of the agriculturists in this part of the country, where this system, though not perhaps altogether unknown, has not, till now, in so far as we are aware, been practised by any. From the time we first conversed with Mr. Robinson, the contractor, and observed his operations, we were of opinion that much good would result from the general adoption of the principle; and we are now fully convinced, that by the process of tapping in draining, there is more, both of national and individual wealth, than in almost any discovery connected with agriculture which has been made for a length of time. Already does the experiment at Rotchell show a surface sufficiently firm and dry for the plough, where, but till lately, the sportsman might well have calculated upon dislodging a snipe. It would perhaps be folly to say that all wet soils might be advantageously redeemed by this process. In some soils, running upon rock, the system is impracticable, and in others, though not altogether impracticable, the poverty of the soil, compared with the expense of draining it, would render the adoption of the system highly injudicious; but in our cold, deep lands, hitherto comparatively unproductive under tillage, from an excess of moisture, and in our deeper soiled bogs and meadows as yet unfit for the plough, there is not a doubt that this mode of draining would prove highly beneficial. We are aware that it has been said that meadow lands are nationally more productive or valuable in yielding hay, than they would be in tillage—as requiring no manure, and affording it to other soils; and to this argument we would have given much weight, if the country had been in the same state in which it was a few years ago, when almost none, except those in the immediate vicinity of towns, could give their lands a sufficient quantity of manure; but now that bone dust may easily be had every where, the value that attached to meadow hay, as yielding manure for other portions of the land, is not sufficient argument why a quantity of our very richest soils should yield only a scanty crop of hay, instead of a luxuriant crop of grain. Nor would the improvement to the atmosphere, in this cold climate, by the removal of the superabundant moisture, be a trifling consideration in the benefits produced. We have said that in some soils running upon rock, the system of draining by boring is impracticable, and hence, in many districts in Galloway, where the soil lies chiefly upon whinstone or granite, or some other species not less easily operated upon, we despair of its being of much avail; but where the spring ooses from freestone, as in many parts of Dumfriesshire, the system is not only not impracticable, but easily followed out. The freestone is easily bored; and, when the spring is caught, it is easily conducted along the rock by means of a small groove, cut in the rock, and covered with flat tiles or slate. Mr. Robinson mentioned to us that he had often been very successful in draining of this description. The great advantage, however, in the system of draining recommended, is in grounds where the springs run along a porous stratum at a considerable depth from the surface, having a stiff or retentive soil above; and as our last notice was rather hurried, we will now endeavour to be a little more particular in our description of the mode by which the system is carried into effect. Having, as we said, cut a ditch of moderate depth along the most hollow part of the ground, which it is wished should be drained, following every curvature which the most hollow part requires, the person in charge of the work is enabled, from one of three circumstances, or rather, perhaps, from a combination of the whole, to ascertain whether boring is requisite. He will see whether the surface along either or both sides of the drain is becoming dry,—whether the water is oosing from the sides or bottom of the drain, and whether the under part of the soil excavated is of such a porous nature as properly to conduct or draw off a spring. If any of

these observations are not satisfactory, and if deeper cutting is not convenient, or too expensive, then tapping or boring is applied; and if this is not successful in one spot, it must be persevered in till the spring is caught. Should the spring, when caught, seem too much for one bore, which is seldom the case, it is only requisite to make another bore near to it, in the line from which the spring proceeds. Having succeeded thus far, it is the business of the drainer to mark, in the course of a day or two, how far from the centre drain the ground is dry where it was wet or moist before, and carrying a drain from the centre drain towards the spot where the moisture of the surface shows that the spring is not yet properly carried off, it is his business again to cut along the seeming line of the spring, in the hope of catching it, which, if it does by common cutting, is so far fortunate; but if he does not, he then taps or bores till he catches the spring in this place also, and thus proceeds towards the higher parts of the grounds to be drained, until he has completed his work. The whole is then laid with tiles and covered in, and rich and flowing crops are soon found, where before, inferior crops, or sour and scanty grasses were the only productions. In most cases it is not convenient, and not necessary, to procure any other soil to fill up the drains than that which has been excavated; but in the centre drain of stiff retentive soils, much should be done to procure a more porous substance to lay upon the tiles, otherwise much injury may be done to the hollow part of the field—more especially when it is ridged across the drain—from the lodgment of heavy falls of rain. This will not be severely felt immediately after draining, as all soils when once acted upon require a portion of time to assume their original solidity. That original solidity will, however, sooner or later, according to the nature of the soil, be attained; and if the tiles, which, generally, in the centre drain require to be pretty deep, be covered three or four feet, or perhaps more, with a retentive soil, it is unreasonable to expect that the drain can properly draw off the water from above. In the old system of draining, the precaution recommended was seldom necessary, as the drains were generally filled with stone sufficiently near to the surface to prevent the injury we have pointed out; and where a porous soil cannot conveniently be obtained, and stones are plenty, it would be a good practice to fill up the drain to a given height with stones; but this would require to be done with great caution, otherwise the tiles would be apt to be so much injured as nearly to destroy the whole benefit of the operation. We are fully sensible that in the remarks we have made we have not nearly exhausted the subject they embrace; but if we have said enough to draw attention to the theory of draining by tapping, and to induce our agriculturists to put it in practice, our object in writing is completely gained. In our previous notice we recommended a visit to Mr. Robinson, at Rotchell—a recommendation we cannot at present give, as Mr. R. is not now there at work; but we understand it is his intention to return in the spring to carry on his system of draining on a scale more extensive than he has yet done on their lands.—*Dumfries Herald.*

Mr. Shillito, of Barrow, near this town, has been for some time past feeding his pigs with frumenty, or wheat crushed in a mill constructed for that purpose, and mixed with hot water, adding one bushel of polard to six of corn. Wheat weighing 17½ stone net, at 14s per coomb, which is the utmost that could be made of it, is the cheapest article that can be used for fattening either pigs or other stock, and there is no doubt that the stock on hand will be greatly reduced in this manner. Mr. Beck, of Lexham, in default of turnips, has this year steamed the tops of his mangel wurzel for fattening beasts, and found that they were devoured with the greatest avidity. It is found, also, that steaming hay is very beneficial, particularly if it be at all damaged in getting up, in which case the process gives it almost the freshness and sweetness of the best new-mown hay.—*Bury Post.*

## SHERIFF COURT OF FORFARSHIRE.

DAVID KYD, TENANT OF BONNYTON OF INVERARITY, v.  
DAVID SCOTT, TENANT OF KNOX OF ARBRILOT.

This is a case involving a question of importance to agriculturists and seedsmen.

In the spring of 1831 the defender sold and delivered to the pursuer eight bolls of perennial rye-grass seed, which Mr. Scott had obtained from the previous year's crop of a part of his farm. The defender retained for his own use a similar quantity of the same parcel of seed to be sown on his own farm of Knox. The seed which the pursuer so purchased was, in spring 1831, sown by him upon three divisions of his farm of Bonnyton; and upon two separate divisions he sowed another quality of perennial rye-grass seed obtained by him from a merchant in Dundee. The defender also the same spring sowed the grass-seed retained by him upon two divisions of his farm of Knox.

In the season of 1832 the whole of the rye-grass seeds so sown, both on the pursuer's and the defender's farms, yielded a good first year's crop, but the result the second year was very dissimilar and extraordinary. On the defender's farm the second year's crop of rye-grass, season 1833, was an excellent one, so much so, that in the spring of the following year there remained a sufficient bottom of rye-grass to have yielded a third crop; and in the season of 1834 the rye-grass sprung thick, and was in a shot state among the corn crop over all the field. On the pursuer's farm, however, the second year's crop of rye-grass from the defender's seed, proved a complete failure—nothing but weeds and natural grasses having appeared, while the crop from the rye-grass seed obtained by the pursuer from Dundee, and sown in the same soil and situation, was a fair average crop. The pursuer in consequence raised the present action of damages against the defender, concluding for 21*l.*, as the estimated loss which the pursuer had sustained in consequence of the defender's seeds having failed in yielding him a second crop, *i. e.* from these being *annual* instead of *perennial*, as represented and warranted when purchased.

In defence, it was averred that the seed sold was the produce of a field which had yielded three successive crops of rye-grass; and that the quantity of the same parcel of seed which the defender had sown on his own farm had produced two good crops in succession; and he therefore maintained that the seed delivered to the pursuer was *clearly of perennial quality*, and that he, the defender, was not responsible for the *after* failure of the seed which the pursuer received from him, but that such failure was to be imputed to the pursuer's own management, and to the inadaptation of the soil of his farm to second year's grass and other causes.

The parties joined issue upon these facts and pleas; a voluminous proof was led for both parties, and joint memorials on that proof were lodged, upon advising which, the Sheriff Substitute, with concurrence of Sheriff L'Amey pronounced the following judgment on the merits, assailing the defender, and finding him entitled to expenses subject to modification.

*Note by the Sheriff.*—The Sheriff is inclined to hold that the seeds were sold as perennial grass seeds.—This is not only explicitly admitted in the defences (while the relevancy of the subsequent attempt to retract or modify that admission may be questioned) but the price asked and paid could only apply to perennial grass seed.

But the main question is, whether, in point of fact the seeds sold and delivered to the pursuer were perennial or only annual rye-grass seeds. Now, the Sheriff is decidedly of opinion that the seeds were perennial; for it is clearly proved that they were part of the *same parcel or crop which the defender sowed on his lands, and which produced a second crop, with an appearance of a third one*; and further, that the defender had no other grass seeds on his farm; but unless they had been perennial no second crop could possibly have been produced. There is thus decisive proof that the seeds sold and delivered to the pursuer were perennial.

The pursuer's case consists of a proof that the seeds

which he sowed produced only one crop; the conclusion drawn from that circumstance being, that the seeds which he received from the defender were not perennial. But the fact that the pursuer had no second crop is by no means decisive, seeing that it has been satisfactorily proved that the seeds which he used were part of the same parcel which the defender sowed, *and which yielded a second crop*, thereby affording demonstrations that the seed was of the description represented. What may have been the true cause of the failure of a second crop in the pursuer's case it may be difficult to trace with an approach to accuracy. But if the seed delivered was truly of the description bargained for, the defender is not answerable for the failure. Various causes why no second crop was obtained have been assigned for the defender, and attempted to be proved, and in particular, that the seed which he delivered did yield a second crop, and that the seeds which failed were got from a different quarter. But whatever may be thought of the proof on that head, yet assuming that the failure arose from the seeds furnished by the defender, various physical causes have been assigned by the defender to account for the failure of a second crop, for which assuredly the defender would not be answerable: *viz.* the improper manner in which the seeds were kept before being used; that they were sown too sparingly; that the soil in which they were sown was wet or otherwise unfavourable, and the exposure cold; and, that the land was ploughed up too early, and before it could be well ascertained whether a second crop might not have been produced. But whether these, or any of them, are proved and shall be held conclusive, or whatever other physical cause may be assigned for the failure of a second crop on the pursuer's land, it cannot affect the defender, if the same parcel of seed, when used on the defender's farm, yielded a second crop—a fact of which there can be no doubt whatever.

The Sheriff does not propose to award full expenses to the defender though the successful party. The case made out by the pursuer, until it was met by the defendant's proof, might have been held to be conclusive, and the pursuer could not, perhaps, be sufficiently aware of the strength of the defender's case, till after the proof was led. It cannot, therefore, be said that the pursuer acted very rashly, on the contrary, the defender required to make out a case to meet and overcome the facts adduced by the pursuer, and for that reason may not be entitled to full expenses. On the other hand, the defender has been successful; and, as the same seeds, if properly used and sown in a favourable situation of the farm, must, in all probability have produced a second crop, the defender is entitled to expenses under modification.

**Whisky.**—The sale of Scotch whisky is virtually interdicted in England. The rate of additional duty of 5s per gallon which is exacted on all Scotch spirits imported into England is at least equal to the value of the commodity, exclusive of duty; and so high an impost amounts to a practical prohibition on the export of Scotch whisky to the English market, the best to which it could be sent, and thus operates most injuriously to the interests of agriculture, by excluding a great portion of the produce from an important department of the commerce in grain. It is well known that this exclusion of Scotch spirits from the English market was a concession to the West Indian interest. The largest distillers in Scotland too had an interest in limiting competition. To favour these two classes the whole agricultural interest of Scotland have been cast into the shade and disregarded, and their industry has been cramped, and the comforts and morals of a large portion of the community have been narrowed and seriously damaged. What we contend for is, an equalization of the duty on British spirits throughout the whole extent of the three kingdoms; in other words, a reduction of the duty on whisky consumed in England to what it is in Scotland or Ireland, whether distilled in Scotland, in England, or in Ireland.—*Berwick Advertiser.*

## AGRICULTURAL DISTRESS.

TO THE EDITOR OF THE STANDARD.

In the consideration of this important question, a brief review of the erroneous theories and opinions which prevail, will enable us more clearly to trace the causes, and to propose the means of lessening the existing evil,

Some are of opinion that if tithes were done away with, farmers would prosper. Were all farms subject to tithes, it might be difficult to combat this opinion; but its refutation is clearly shown by the simple fact, that complaints of depression are by no means confined to the farmers who pay tithes, but equally apply to those who cultivate tithe-free land. That a commutation is desirable is so obvious as to be generally admitted; but those who fancy that a commutation, or even the annihilation, of tithes would now give prosperity to agriculture, grasp at a delusive shadow.

Foreign corn having been long virtually excluded from British markets, establishes the fact, that foreign competition is not the cause, and also that the existing corn laws are practically effective; but it must be admitted as a great hardship to the English farmer, that the produce of Ireland, where labour is comparatively so low, poor-rates unknown, and taxes so light, should be admitted, without any countervailing duty, proportioned to the unequal charges of production.

Various changes in the currency are proposed. Some advocate the more abundant issue of paper, others a change from gold to silver, as the standard value. Conflicting as opinions are upon the subject, one thing is certain, that every change in the currency has hitherto been accompanied by disastrous events; nor can it be denied that money is abundant, at a reasonable rate of interest, to all those who can give good security.

Others have suggested, as a remedy for the evil, a reduction of the land tax; but it is so manifest that farmers ascertain what taxes they will have to pay, and agree for the rent accordingly, that it would be a waste of time to proceed with this part of the subject in discussion.

Having thus excluded some of those erroneous theories and opinions, from the indulgence of which nothing but disappointment can ensue, let us proceed to the main question, agricultural distress; or, in other words, the insufficiency of farming produce to pay the charges of production, the consequent sinking of the farmer's capital, and his inability to employ or to pay the labourers required to cultivate his farm. Iron, indigo, cotton, sugar, can each be sold in any quantity at prices materially advanced; not so with wheat. Why this difference? Simply because for the former articles the demand has exceeded the supply; for wheat the supply has fully met, and probably exceeded, the demand.

Various causes operate to lessen the consumption of grain. To meet the extraordinary demand, and consequent extravagant prices, during the war, a great extent of inferior land was brought into tillage; the tillage remains, but the navy and army, which consumed the produce, are dwindled into comparative non-existence. In the mean-time, the vast increase of potatoes as a substitute for corn; of turnips, mangel-wurzel, &c. as a preparative for grain, instead of the unproductive fallows which formerly prevailed; of tea, coffee, and sugar, instead of milk and oatmeal; the vast increase of canal navigation, enabling one horse to do the work of twenty; the substitution of steam power in the place of horse and manual labour; the continuance of the tax on malt, which the improvidence of ministers in the mismanagement of the national revenue still renders necessary—these circumstances, together with a long succession of favourable harvests, sufficiently explain the heaviness of the market for agricultural produce.

But are there no other causes for farming depression within the power of government to alleviate? "A Farmer's Friend," in the *Standard* of the 17th instant, sensibly proposes to "get rid of the tax on soap, and to

put the tax on tallow." This may not accord with the prevailing folly of free trade, but it would enable many farmers to abandon the ruinous system of ploughing bad land; by the inevitable result of cause and effect it would raise the price of grain and lower that of butcher's meat; and it would lessen the expense of collecting the revenue, besides getting rid of the annoyance and frauds attending the excise on soap.

There is also another boon, which, if granted, would operate immediately and extensively in favour of the agricultural interest. Abolish the post-horse duty, and an increased demand for horses, and consequently for hay, corn, and pasturage, would immediately ensue; the breeding of horses would become an important object to farmers in remote districts, whilst those in the vicinity of towns, or public roads, would find a new and beneficial remuneration by hiring out their horses. The post-horse duty restrains the public from the free use of their horses, and the farming of it (a mode of collection notoriously iniquitous, despotic, and unconstitutional) tends to emigration, and materially checks travelling in Great Britain. In repealing this odious impost, the benefit will not be confined to the farmer, but it will essentially add to the comfort and convenience of the middle classes of society. The gross revenue, which, as stated in yesterday's *Standard*, amounts in England, Scotland, and Wales, only to 231,020*l.*, is such a mere trifle, compared with the mass of fraud and oppression it occasions, as not to deserve a moment's hesitation; besides, it may reasonably be expected, that by the indirect taxation it would occasion, added to the tax on additional horses, the apparent deficit would be amply supplied.

Dec. 31, 1835.

AMICUS ANGLIÆ.

TO THE EDITOR OF THE MARK  
LANE EXPRESS.

Sir,—I remember to have seen in some reports of agricultural proceedings, held in various places during the past summer, that a gentleman had discovered a preparation for the *Straining in Sheep in Lambing*. I cannot find any of the papers referring to it. I am therefore ignorant to whom inquiry is to be made upon the subject, but as the matter is one of public interest, I have no doubt this application to you will draw the attention of some of your numerous readers who will give me the required information. As the lambing season is near approaching, I shall be glad to know where it is to be procured, that myself as well as other lamb-growers who have heard of it, may have some in readiness, in case we should experience so unfortunate a season as many of us did last year; it will be most desirable, indeed, to be in possession of any thing to prevent such severe losses as occurred last season. Relying upon your readiness to afford information to your agricultural friends,—I am, your obedient servant,

A SUBSCRIBER.

Grantham, Lincoln, Jan. 6, 1836.

STEAM CONVEYANCE.—Not only our agriculturists, but our nurserymen and seedsmen, are likely to receive very considerable advantages from the facilities of steam conveyance. As a proof of this, we may mention that one of our active townsmen lately shipped in the *Nithsdale* not less than 400,000 plants for the north-west of England or Wales; and that this was but one of many shipments of a similar kind which he or others have made. Sending plants from this district to England or Wales is not, we admit, entirely the result of the establishment of conveyance by steam, as our ordinary traders have for many years been more or less employed for this purpose; but, from the great delay to which ordinary traders are liable, it is evident that the communication by the steamers gives a security for the freshness of the plants upon their arrival which cannot otherwise be depended upon. The steamers also afford

a facility and despatch of communication to the seedsmen hitherto unknown. In illustration of this we may mention that the individual to whom we have referred lately wrote a letter to Liverpool for seeds upon a Monday, and received his order in sufficient time to vend a considerable quantity of them on the first Wednesday following.—*Dumfries Herald*.

## AGRICULTURAL DISTRESS.

TO THE MARQUIS OF CHANDOS, M. P.

(From the Morning Herald.)

Precisely as I foretold, my Lord Marquis, the landed interest have again had their meetings and their talkings, their eatings and their drinkings, but without arriving at any determinate conclusion, or any fixed principle of co-operation. Each seemed to have his own particular nostrum, while all is left to the "wisdom of Parliament," that same wisdom which has again and again assembled for a similar purpose, particularly two years since, when it was occupied many weeks, and finally separated without being able to draw up a report, or daring to give the real cause of the distress, although obvious to every member. The same result will follow in the ensuing Session, unless some master mind has the moral courage to make a stand and preserve the country from convulsion. However, we shall see. Patience, you know, my Lord, is a great virtue. "Oh but," I hear your Lordship exclaim, "you have forgotten that a 'Royal (?) Central Agricultural Association' has been formed, and a Committee of forty appointed." I am truly sorry such a proceeding should have taken place, and I was forcibly struck with the observations of Mr. Sheldon, M. P., on the subject of this exclusive Association. As regards the word "Central," its very name is odious; it savours of all the undigested pranks and projects of the Scotch philosophers, the political economists, and the detested and detestable Poor Law Amendment Act. I greatly mistake if this Association is not illegal; I am satisfied it is unconstitutional. Both the Statute-book and the records of the King's Bench furnish proofs that a combination or conspiracy of few or many, to raise the price of the necessities of life, is an indictable offence. Trials, convictions, and punishments have taken place for such practices. This association may and will embarrass any Government; but it will never obtain relief, or enforce an alteration in the currency if the members of the Government wish to retain their heads upon their shoulders. It is this conviction which makes the commercial and manufacturing interests (with the King of Prussia at their head) behold the formation of the Association with feelings of indifference, perhaps of contempt. With regard to the Committee of forty, the number will seem ominous and very *Ali-Baba-ish* to those who have read the "Arabian Nights' Entertainments." I wish they may not obtain the name of "The Forty Thieves." Not only is the name of this Association objectionable, but its initiatory proceedings were equally so—the adoption of the appellation "Royal" without permission—the very improper and unauthorised application by one of the self-elected Secretaries to the King for his individual patronage of an association which may terminate in setting one class of the King's subjects against the other—an application answered most properly by Sir Herbert Taylor, in terms which did great credit to his Majesty's foresight and discernment—the petition for apartments in our tax-eating dens—the *exclusiveness* evinced throughout their proceedings—in short, the whole thing savours of Whitehall jobbery. In order to obtain redress of grievances for all the suffering classes of the country, the subject must be taken up in a very different manner, and I think by very different people. This exclusive Central Association will but mystify the premises and probably serve the wishes of Government by embroiling conflicting interests in an open affray.

But, my Lord, the general prevalence of agricultural distress is by no means an admitted fact. I heard it re-

cently disputed myself at a very large public meeting. Comparisons are made between the prices of the year 1821—2 and 1834—5. In the former period, say your opponents, *all produce* was below a remunerating price, not wheat only, but meat, barley, oats, hops, and wool. Whole parishes were then thrown out of cultivation to my knowledge. Distresses for rent and fore-closures of mortgages swept like pestilences throughout the land. Is this, continue your opponents, now the case? This ought, as it readily may be combated by the landed interest, and undeniable proofs given of the fallacy of those arguments. Again, it is absolutely necessary to convince the Government (and when I use the term Government, I mean no particular party) of the existence of this general distress, who are very ready to see the two great interests of the kingdom divided; deluding themselves with fallacious hopes that distress is not generally prevalent because the taxes are paid, the revenue flourishing, and the old dropical hag in Thread-needle-street still casting favourable glances to Downing-street. Your Lordship has too much good common sense not to know that those symptoms are in truth the very causes which promote and increase the evils which are the subject of complaint. I would also premise that the manufacturing interest ought to be convinced of the *real* intentions of the landed interest in forming this "Central Association," having power to "levy money" and call forth "representation." The amount of the home and foreign consumption ought to be fairly and honestly ascertained, without which knowledge no honest mode of relief can be obtained beneficial to both interests. But above all, my Lord Marquis, the Aristocracy and the Clergy must abate, not their rents and tithes, but their pride and their exclusiveness. They must believe there exists persons who can save and serve the country, not bred in the purloins of Whitehall or nurtured in the corrupted atmosphere of the aristocratic dining rooms, drawing rooms, and club houses. The working classes must be propitiated. The country gentlemen (Mr. Cobbett very justly observed) will never see the day when the working classes will be again united to them, unless they shall cordially take the lead in common with those working classes. This I am in hopes they will yet do, otherwise every day of their lives will make their own inevitable ruin more and more manifest. But whether they do this or not (a task rendered ten-fold more difficult by the Poor Law Amendment Act), the consequences of a continuance of the present system will be the same. Prolongation will only tend to make the catastrophe more dreadful than it otherwise would have been. If the monster debt remains the same, with a gold currency of 3/17s 10/3d per oz., it will regularly go on producing misery upon the back of misery, and irritation upon the back of irritation. It is that cause, my Lord (turn and twist it as you will), which is constantly at work, the remedy for the evils of which, I once more repeat, is neither physically nor morally, nor unconquerably difficult (although painfully labourious), if the proper steps are taken, grounded upon the precedents and provisions already to be found in the Statute-book, and even in the Sacred Volume itself. What tremendous mischiefs must result from the monstrous proposition of putting out an unlimited and irresponsible issue of paper money; and no means could be devised for limit or control. It is the very essence of paper money to extend its quantity. Suppose the paper thus increased to reduce the value of the currency only one-third; of course all contracts whatever, public or private, foreign or domestic, would be reduced one-third, till at length the discredit of the paper would (as was the case in France) become so notorious that foreign nations would keep aloof from any commercial dealings with this sunken nation. I think that any project for getting out new quantities of paper will not succeed. Without it, however, the interest of the debt and the expenses of the State, with wheat at 4s 6d the bushel, (whatever may be said in Downing-street) cannot be paid out of the taxes. In all human probability the whole of the interest of the fun led and unfunded debt, all the sinecures, pensions, and salaries, and the expenses of a thundering standing army, will continue to be made up by

taxes, by loans from the Bank, by Exchequer Bills, by every species of contrivance, to the latest possible moment, and until the whole of the paper system, amidst the war of opinions, of projects, of interests, and of passions, shall go to pieces like a ship upon the rocks. This was Mr. Cobbett's prediction, and this is now the dreaded catastrophe I would lend a helping hand to prevent; and I can confidently assure the Editor of that most sapient Journal, the *Globe* newspaper (who has been pleased to be somewhat facetious on my former letter to your Lordship), that I am prepared at the proper time, and in the proper place, to submit the plan of a safe, honest, and efficient remedy, in co-operation, however, with other industrious, well-intentioned, and courageous individuals, who, in common with myself, have long foreseen the battle now about to be fought between the landlords and the fundlords—the one the victims of pride and obstinacy, and the other of self-interest and delusion.

SAMUEL WELLS.

Sergeant's Inn, Jan. 1, 1836.

### TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—My professional avocations calling me into the counties of Kent and Lincolnshire, I have frequently heard that the rents on the estates of Earl Stanhope and Col. Sibthorpe—who as far as can be learned from their speeches at agricultural meetings, entertain the deepest feelings of commiseration for the distressed condition of the agriculturists—are screwed up to the highest pitch. As these statements may have originated in some unworthy motives, and are calculated to prejudice these gentlemen in the eyes of the public, and to weaken the effect of their efforts in favour of the agricultural interest, perhaps some of your readers may be possessed of information which will enable them to set this matter right, by communicating the truth through the medium of your journal.

I am, Sir, your obedient servant,

A LAND SURVEYOR.

### PRACTICAL PLAN OF IMMEDIATE RELIEF TO THE TENANT FARMER.

The tenantry on the estate of Moncreiffe having invited Thomas G. Mackay, Esq. to a public dinner, in testimony of their sense of the kindness and liberality uniformly experienced by them in his management of the estate, as well as of their high respect for the general excellence of his character,—the dinner took place on Friday week, in Cameron's Hotel, Bridge of Earn. In addition to the tenantry on Moncreiffe Estate, several gentlemen and a number of tenants in the neighbourhood not connected with the estate were present, spontaneously and cordially concurring in this mark of their esteem. The evening was spent in the most agreeable manner, and at a late hour the company separated, highly gratified by the opportunity they had enjoyed of evincing their regard for their distinguished guest, and for the family of Moncreiffe.

Mr. Arnott of St. Magdalene's was in the chair, and Mr. Condie of Hiltown acted as croupier; and it is but just to those gentlemen to state, that both of them performed their respective duties, in a manner which conduced highly to the good feelings and festivities of the evening.

The dinner was excellent, and the party were so much pleased with the arrangements Mr. Cameron had made for their comfort and enjoyment, that the chairman took an opportunity of expressing his en-

tire satisfaction with the good cheer that had been provided for them, on so short a notice.

In the present time of extraordinary depression in the agricultural interests, it is very gratifying to have to record to the honour of the family of Moncreiffe, and those entrusted with the management of the estate,—that lately, and without solicitation on the part of the tenants, an arrangement has been entered into, by which the whole rental of the estate is converted into grain on fair and liberal principles; and the tenants are thus secured in the same quantity of the produce of their farms being equal to the rents now payable by them, as was necessary to discharge their obligations on that head when they entered into their bargains. This example of consideration and generosity it is to be hoped, will be generally followed.—*Perth Courier*.

AGRICULTURAL DISTRESS.—Extract from a letter on this subject, addressed to the Editor of the *Hampshire County Paper*:—"Deeply rooted is the evil of which we have to complain; the disease has taken so firm a hold that the remedy, which on the onset might have been simple, must now be of a decisive character. It is to a combination of remedial measures, and not to the abolition of one or two obnoxious imposts, from which general relief is to be expected. Reductions of rent would be an immediate and great source of relief; but tenants must first assist the landlords in obtaining measures which will enable them to reduce. Equalization of taxes, both local and general; a fair adjustment of tithes; imposition of poor laws in Ireland, would go a great way in giving them this power; and to these objects, with the abolition of one or two unjust and hateful imposts—malt tax for instance—it would be well for us to fasten our expectations of relief, rather than in a return to a currency of rags, which, now that confidence is lost, or rather the mad delirium of the war subsided, could have no effect in raising prices, in the face of an increased annual supply of one-third more quarters of wheat which now appears to be derived from England, Ireland, and the Colonies, as compared with years in which farm produce bore such extravagant prices.

A NEW DISCOVERY IN CHYMISTRY.—We have to notice the discovery of another of those active vegetable principles which every fresh analysis of plants brings to light. This substance, which has been termed diatase by its discoverers, MM. Payen and Persoz, occurs in barley which has just begun to vegetate. It has little or no action upon any organic matter, excepting starch, upon which it is so considerable as to render 2,000 times its weight of the latter soluble in four times as much warm water. If the proportion of the diatase be increased to about 1-200th of the weight of the starch, and the whole heated to a temperature less than that of boiling, it will be found that the starch has been wholly converted into a mixture of sugar, with a gum resembling gum arabic. The latter is now employed, in the great hospitals of Paris, as a substitute for gum arabic. The fact has been long known, though not previously accounted for, that beer, equally strong, may be brewed from a mixture of malt and barley, as from malt alone; and distillers have availed themselves of this circumstance. The starch of the barley is, by the action of the diatase of the malt, converted into gum and sugar, and the latter, when fermented, furnishes the alcohol or spirit. In organic analysis, diatase, from the extraordinary power which it possesses of rendering soluble so vast a proportion of starch, will render valuable service, as it will enable the chymist to separate the smallest portions from foreign substances.—*The Analyst*.

## SOME ACCOUNT OF THE FAIRS IN SCOTLAND.

EAST-LOTHIAN OR HADDINGTONSHIRE.

*(From the Quarterly Journal of Agriculture.)*

1. HADDINGTON MARKETS.—Haddington, the county town, is a considerable one, containing 5,883 inhabitants. It is sixteen miles to the eastward of Edinburgh, on the great London-road, by Berwick-upon-Tweed. It is a royal burgh, but being a country town, its trade is entirely dependent on agriculture. Its grain market, a stock one, held on Friday, is one of the principal in Scotland; and, as the town is situate in one of the finest districts in the country, the grain presented is generally of the finest quality, and fetches the highest prices. Its old fairs are now nearly gone into disuse, and are unworthy of particular notice. The only cattle markets in it are those established by the East-Lothian Agricultural Society a few years ago. The *first* is held on a Friday in April, the day being fixed by the Society by public advertisement. Along with a show of stock for premiums of bulls, stallions, fat cattle, and sheep of different descriptions, and also grazing-stock belonging to the members of the Society, there are generally from two to three hundred fat cattle shown of different breeds, both short-horns and north country cattle. Should cattle be in demand in England, English dealers attend, but the principal purchasers are the fleshers from Edinburgh, though a few are picked up for Glasgow. This market is improving and well worth the attention of those who wish to buy prime fat stock. The *second* of these markets is held on the Friday preceding All-Hallow Fair at Edinburgh. Some years ago north country dealers attended this market, but, being so near All-Hallow, it has latterly been nearly deserted. The *third* is held in December, on a Friday fixed by the Society, when premiums are awarded for different sorts of fat cattle and sheep; and also a market for fat stock is held. About the same number is presented as at the market in April. The quality of the whole stock at this market is of general excellence. The fleshers of Edinburgh and Glasgow buy them all up. The premium stock are first-rate, and would do honour to Smithfield. Their carcasses cut conspicuous figures at the stalls of the fleshers, who purchase them for the Christmas and New Year's feasts of the gentry who frequent Edinburgh at that season.

2. DUNBAR HIRING MARKETS.—Dunbar is a considerable sea-port town of 4,735 inhabitants, situate on the north-east point of the county; 28 miles east of Edinburgh, and 30 from Berwick-upon-Tweed, on the great Edinburgh and London mail road. It is a royal burgh, and has a weekly corn-market on Tuesday. Many of the inhabitants are in the sea-faring line, and engage largely in the herring-fishery when the herrings approach the Frith of Forth. The fairs in this town were held chiefly for the hiring of single farm and domestic servants, immediately after the terms of Whitsunday and Martinmas; but according to an agreement among the farmers and servants in East-Lothian, married farm-servants are hired on the farms. The few cattle that are bought and sold at markets at Dunbar, deserve no particular attention.

The ploughmen in East-Lothian are married men, and their characters stand high for good behaviour and expert workmen. Their wages are;

a house and garden, for which they must provide a shearer for twenty days, who gets victuals. The shearers' victuals consist of oatmeal porridge and milk at breakfast and supper, and a wheaten loaf and beer at dinner. They must also provide a woman or boy, the woman being preferred, to work field-work in summer, who receives eightpence a day when employed. Coals are drawn to them free of carriage and tolls, and they may keep pigs confined in a sty. They receive of corn, nine quarters of oats, eighteen bushels of barley, and eight bushels of peas; 800 yards along a drill of potatoes, the servants supplying the seed, but good servants are frequently encouraged with 1,000 yards. As much land as will sow one peck of linseed, which may cover from eighty to ninety yards, along a fifteen-foot ridge; but on many farms this allowance is relinquished, and a guinea given in lieu. A cow is kept for them all the year round; and, where the land is so clayey that little turnips are grown, hay is given instead. There is a very good practice among the ploughmen of this county of insuring their cows, which deserve imitation. If a cow happens to die before she is nine years old, the owner is reimbursed by an insurance club among the men, to which they subscribe a small sum annually; but if after that age, the risk is the owner's. There is no money wages given. We have heard it alleged that the farm cottages in East-Lothian are inferior in comfort and convenience to what the men deserve. This might have been the case many years ago, and perhaps is so still, in many cases; but the same remark would have then applied as well to farm-houses. Now, however, it cannot be denied that the style of the farm-houses is greatly improved. Farm-steadings are now of a very superior construction, and when improvements of this kind are executed, the servants' cottages are never neglected. The danger consists, in our opinion, of going to the opposite extreme of making cottages too capacious, by giving servants two-storied houses. Their furniture, in that case, becomes quite unsuitable for such houses. It is no kindness to put a man into a house which he cannot afford to furnish; and, on the other hand, useless furniture is a drain on the poor man's pocket, and a great toil to him when he unhappily has to move to a new abode. All that a farm-cottager really requires is a "but and a ben,"—comfortably floored with pavement or brick, and roofed with lath and plaster—not divided by a partition wall, but much more comfortably by the furniture, which can be arranged to form two sleeping-apartments, with fire-places, one to be occupied as the ordinary cooking room, and the other containing within it a store-room for meal, potatoes, and milk.—A large window to each apartment, and a small one where the store-room should be—with an inner door on one side of a small hall or "hallan," within the outer door. An outhouse behind for the pig and coals is a great convenience. No good servant should be deprived of these comforts, nor compelled to uphold superfluities.

3. GIFFORD FAIRS.—Gifford is a small village situate at the base of the Lammermuir Hills, hard by Yester House, the seat of the Marquis of Tweedale, and is eighteen miles south-east from Edinburgh, six south of Haddington, and eighteen from Dunse in Berwickshire over the Lammermuir Hills by Longformacus. There are three fairs held yearly in Gifford, and these are the only ones of importance in East-Lothian. The first is held on the last Tuesday of March, principally for the sale of ewes at the lambing. The ewes are

chiefly of the Cheviot and black-faced breed from the adjoining Lammermuir Hills. From 2,000 to 3,000 are shown mostly by the breeders, who sell their best ewes at this season, the principal buyers being the East-Lothian farmers and graziers, although some graziers attend it from different counties, who take grass parks for the summer, and feed off both ewes and lambs for the butcher. The age of the cast ewes from the Lammermuir Hills does not exceed five years, being younger than the west and north country ewes; and, being sound off these hills, they thrive well, and make themselves fat on good grass after they have fed off their lambs, while the north country ewes when sold are six or seven years old, and do not get fat. This advantage makes graziers give the preference to Lammermuir and other south country ewes. Old ewes require very fine keep to feed off. Occasionally a few lots of wethers and hogs are shown, but this is principally a ewe market. Very few cattle or horses are shown at this fair.

2d. The second fair is held on the third Tuesday of June, at which is a good show of wethers and hogs, with a few ewes and lambs, and occasionally a few fat lambs, from 3,000 to 4,000 of different kinds being generally exposed to sale from the Lammermuir Hills, and high parts of East-Lothian. The lower part of the county not being a breeding district, the sheep shown at this fair are principally purchased by farmers, from the low districts, who graze them and feed them for the Edinburgh market. Sheep from the hills are, however, seldom full of condition as to get prime fat off the grass, but with a month or two on turnips, they come very prime to the market by New Year. The wethers from the high parts of Lammermuir, and the hogs from the side of the hills, coming off sound and hard land, make rapid improvement when they get to good keep in the low country. There is generally a pretty fair show of cattle at this fair, say from 400 to 500, mostly short-horns, which are not so well bred as those on the south side of the hills. They are generally two-year olds, and are mostly purchased by farmers and feeders in the low country. There is sometimes a good display of north country grazing cattle, and a few lots of short-horns are brought by dealers from the southern districts, and when the season is favourable for grass, they meet a ready demand; but this of course depends entirely on the state of the pastures, which also regulates the prices in the sheep market. Very few fat cattle are shown at this fair, although there is sometimes a fair show of indifferently bred milch-cows. The aged cows are purchased for the Edinburgh market, and the younger sorts for country use. There is generally an excellent show of horses at this market, and numbers of buyers and sellers from Edinburgh and the surrounding country attend, and do a great deal of business.

3d. The third fair is held on the first Tuesday of October, when a large show of sheep, principally of draft or cast-ewes, is presented, the great bulk of them being Cheviots and black-faced—the Cheviots predominating, with a few lots of Leicester and half-bred ewes, and wethers and hogs. The number of the whole varies from 3,000 to 4,000, most of them being from the Lammermuir Hills. Several of the Cheviot lots come from Gala Water, and other pastoral districts in the south, and some of the Leicester and half-breds from Lauderdale. The principal purchasers are farmers from the low parts of East-Lothian, who keep no

breeding-stock, and buy in ewes at this season, and put Leicester rams to them, and their produce makes excellent lambs. The lambs from the Cheviots, or black-faced ewes bought at this fair, are lambed in March, and ready for the Edinburgh or London markets. Such lambs are very superior when allowed to suck till they attain nine and ten lbs. per quarter, when they suit the London market well, where some of them, of late years, have brought very high prices, in May and June, when lamb begins to decline in price in the Edinburgh market. This opening to the London market by steam-navigation, holds out a strong inducement to East-Lothian farmers to buy Cheviot and black-faced ewes in October, as the lambs from Leicester, and half-bred ewes, being first ready for the Edinburgh market, before May, and being much too small for London, are worth a good price in Edinburgh; but the lambs, from Cheviot and black-faced ewes wintered in East-Lothian, becoming ripe only in May or June, their weights then suit the London prices. Consequently considerable shipments are made of lambs at that season, which, without such an opening, would have to be sold in Edinburgh, at the then low Edinburgh prices.

Ewes, although bought at high prices at this fair for some years past, have paid well, principally from the high prices of lamb and wool. When they are well-wintered, and full of condition at the time the lambs are taken off, and when they are well-pastured for about six or eight weeks after, they become early ready for the Edinburgh market; and thus by the sale of both lambs and ewes a great advantage is derived over the spring-bought ewes, which are much later in getting ready for the market, and must encounter the competition of stock from the high districts. Highland farmers have now found out, that light stocking pays them better than heavy, and by that means they can now send their lambs and ewes into the market nearly as early as the spring-bought ewes and lambs of the low country.

There is a pretty good show of cattle at this fair, mostly short-horns, a number of which are shown by south country dealers, who purchase them at Jedburgh and other markets in the southern districts; the remainder are six-quarter and two-year olds bred in the country, with a few lots of north country bred cattle. If turnips are a good crop in East-Lothian, a few farmers who care not to go far from home to purchase stock, create a good demand at this fair. Very few milch-cows are shown at this season; but those which are new-calved, or at the calving, generally meet a ready demand from the Edinburgh cow-dealers. There is also a good show of horses, and a number of dealers from Edinburgh and the surrounding country attend both as buyers and sellers, and generally transact a good deal of business.

One of the East-Lothian agricultural shows is held at Gifford at this market. Premiums are awarded to Leicester, Cheviot and black-faced tups and ewes, and Leicester gimmers; and there are always some very fine specimens of each kind of stock shown.

Fairs occur at North Berwick on the last Thursday in June, and the last Thursday of November; at Stenton on the last Thursday in October; and at Cockenzie on the first Thursday in November; but they are of no importance, and ought to be abolished. Linton, however, appears a very eligible situation for a market, being in the middle of the county, and on the great leading road

through it. We conceive that a monthly market established there on a similar principle to those at Kelso, Coldstream, and Dunse, which we have already described, would be of essential service to the feeders of stock in East-Lothian. If it were held on Monday morning, the dealers who attend Edinburgh and Morpeth would have time to bring the stock forward for the weekly markets on Wednesday, at both these places.

## ON SHOEING HORSES THAT STRIKE OR CUT.

BY MR. MOORCROFT.

To prevent a horse from striking the foot or shoe against the opposite leg, by which it is often bruised and wounded, is an important point, inasmuch as this accident occurs very frequently, and as it not only blemishes and disfigures the leg, but also endangers the safety of the rider.

The parts struck in the hind leg are the inside of the fetlock joint and the coronet; in the fore leg, the inside of the fetlock joint and immediately under the knee; which latter is called the speedy cut, from its happening only when a horse goes fast.

Young horses when first backed generally cut their fore legs, though naturally they may be good goers. This arises from their placing the foot on the ground too much under the middle of the breast, in order the better to support the burthen to which they are unaccustomed; but by degrees they acquire the method of balancing the weight with the foot in the same direction it would naturally have if they were without it. It may therefore be laid down as a rule with such horses, that until they regain their natural method of going, the edge of the inner quarter of the shoe should follow the exact outline of the crust, but should not be set within the crust, nor should the crust itself be reduced in thickness; as both these practices tend to weaken the inner quarter, and to deform the hoof. And here it must be observed, that the outer edge of the shoe should in all cases of sound feet follow exactly the outer edge of the crust, except just at the heel, where it should project a little beyond the line of the hoof.

Horses with narrow chests have their legs near together, and are apt to cut when they begin to tire; and with these the practice just mentioned should always be employed. Horses that turn their toes much outwards are, of all others, most subject to cut. It has been asserted that this defect also happens to those who turn them much inwards; however, the author does not recollect to have met with a single instance of the kind in the course of his practice. In horses of the first description it has been long observed, that the inner quarters of the hoof were lower than the outer, and that the fetlock joints were nearer to each other than in horses whose feet pointed straight forwards. These two facts probably led to a conclusion, that if the inner quarters were raised to a level with the outer, and so much the more as they were made proportionally higher, that the fetlock joints would be thrown farther apart, so as to admit of the foot passing by the supporting leg without striking the joint. Accordingly, for the last two centuries at least, it has been usual to make the inner quarter of the shoe higher than the outer; not only has this been the general practice, but it has been regularly recommended by every writer from that time to the present; and notwithstanding this method has very frequently failed of success, yet repeated disappointments have never led to the questioning of the truth of the principle. Nay, indeed, the reliance placed upon it has been so strong, pro-

ably from the simplicity of the reasoning on which it is founded, that, in the cases where it most particularly disappointed expectation, its failure was generally attributed to the practice not being carried sufficiently far, and accordingly the shoe has been still more raised on the inner quarter, and the edges of the crust and shoe have been filed away. When with these expedients it likewise failed, the last resource has been a circular piece of leather placed round the joint to receive the blow of the foot.

It is now about four years since that a shoe with the outer quarter thick and the inner one thin was, for the first time, in the practice of the author at least, employed in a case which baffled many attempts on the old plan.

On the first trial the horse ceased to cut, nor has he ever done it since; which can only be attributed to his having constantly worn the same kind of shoe. This circumstance did not then excite in the mind of the author any doubt as to the propriety of a practice which had so long been generally acknowledged but was rather considered as an extraordinary exception. However, other bad cases, which occurred occasionally since that period, were treated in the same way, and with the same success. These facts, at length, led the author to conclude, that a practice which was so uniformly followed by success, in cases where the established one was uniformly failed, must necessarily repose on a better principle; although for a long time he was completely at a loss how to explain it; for if the action of cutting did principally depend upon the faulty position of the fetlock joints and the feet with respect to each other, and it appeared to be generally agreed that such was the fact, it should seem that a means, which by raising the outer quarters would throw the fetlocks still nearer to each other, would necessarily increase the defect in question; but as the reverse of this actually takes place, it might induce a suspicion that there exists some other cause of cutting which has been hitherto overlooked.

A minute examination of this point would far exceed the limits allotted to this division of the work; and, therefore, at present the author will confine himself to that part of the subject only which is absolutely necessary to be understood.

For horses, therefore, which cut their hind legs, the shoe at the outer heel should be half an inch in thickness, according to the kind of horse and the degree in which he cuts. The web of the shoe should gradually become thinner until it reaches the toe, which should be of the ordinary thickness, and from which it should slope off, and end in a tip in the middle of the inner quarter. This shoe, in point of effect, would be equally proper for the fore feet, were it not that in such horses as are used for the saddle, the fore feet, being more charged with weight than the hind ones, are much more liable to be injured, and a horse thus shod on the fore feet might go unsafe; therefore it is expedient to let the inner quarters of the shoe be thin, and reach to the heel, but the outer edge should be bevelled off, so as to slope inwards. The same kind of shoe is equally well calculated to prevent the speedy cut; observing to bevel off still more strongly the part which strikes, and not to put any nails thereabouts. And here it may be proper to remark, that in sound feet the heel of the shoe should reach as far on the heel of the hoof as to admit of the angle formed by the crust and the bar resting fully upon it; but it should not be carried quite as far as the end of the heel of the hoof.

In order to ascertain what would happen to a horse shod with different kinds of shoes, the following trials were made:—

**EXPERIMENT I.**—A horse with a narrow chest, who had never cut, and having parallel shoes on his fore feet, was trotted at about the rate of eight miles an hour in a straight line over ground sufficiently soft to retain slightly the impression of the shoes, but not to admit the feet to sink into it.

Two parallel lines were drawn along the track, including between them the prints of the shoes. By these it was found that there was regularly a distance of nine inches and a half between the outer edge of the near fore shoe and that of the near off shoe.

**EXPERIMENT II.**—Shoes thick in their inner quarter, and like a tip, reaching only half way on the outer quarter, were then used; and it appeared that the distance between the outer edges of the prints of the shoes, taken as before, were regularly reduced to eight inches and a half.

**EXPERIMENT III.**—The same shoes were placed on the opposite feet, so that the thick heel was on the outer quarter; and the result, under circumstances exactly the same as the foregoing experiments, was that the distance between the outer edges of the points of the shoes was regularly increased to 11 inches.

To account for these results, it is necessary to attend closely to the different effects produced by the weight of the fore part of the body acting upon the two fore feet, when raised on the inner or outer quarters, during the opposite states of rest and action. And first, with regard to shoes raised on the inner quarter: whilst a horse so shod is standing still, the fetlock joints are certainly thrown farther apart than when any other kind of shoe is used. Hence it was concluded, that the limb which supported the body would have its fetlock joint thrown so much outwards as to keep it completely out of the way of the foot in motion. But it appears that the impressions made on the ground by such shoes are an inch nearer together than those made by parallel shoes, and two inches nearer together than those made by shoes raised on the outer quarter. And this may be thus explained: when the horse is at rest, the weight is supported equally by the two fore feet; but the instant one foot quits the ground, the weight is suddenly transferred to the other, and by the outer quarter being lower than the opposite one, the fore part of the horse has a tendency to fall over the outside. To prevent this, the moving foot is suddenly brought close to the fetlock of the supporting foot, in order to relieve it by catching the weight, and the foot itself is placed on the ground too much under the middle breast. The same circumstance occurs to both feet in their turn; and the horse, being thus in constant danger of falling to one side or the other, is constrained to bring his feet near together to preserve his balance, and in doing this strikes the foot against the opposite fetlock.

It frequently happens, that the more the toes are turned outwards the nearer the fetlock joints are brought together, and the more the horse is disposed to cut. However, this is true only to a certain extent; for if this faulty position of the lower part of the leg be carried artificially beyond a certain point, instead of producing an increased degree of cutting, in most instances it remedies the defect altogether. The reason of this is just the reverse of what takes place when the inner quarter is raised; that is to say, when the weight of the fore part of the body rests only upon one leg, it bears too much upon the inner quarter, from its being lower than the outer quarter; and thus the horse has a tendency to fall over to the inside of the supporting leg.

To prevent this, the moving foot is thrown farther from the supporting leg, in order to maintain the balance, and thus the foot misses the fetlock joint.

## RAPID PROPAGATION OF DOMESTIC QUADRUPEDS OVER THE AMERICAN CONTINENT.

Humboldt observes, in his travels\*, on the authority of Azzara, that it is believed there exist in the pampas of Buenos Ayres twelve millions of cows, and three millions of horses, without comprising in the enumeration the cattle that have no acknowledged proprietor.

In the Llanos of Caracacas, the rich haters, or proprietors of pastoral farms, are entirely ignorant of the number of cattle they possess. The young are branded with a mark peculiar to each herd, and some of the most wealthy owners mark as many as fourteen thousand a year. In the northern plains, from the Orinoco to the Lake of Maracaybo, M. Depons reckoned that 1,200,000 oxen, 180,000 horses, and 90,000 mules, wandered at large. In some parts of the valley of the Mississippi, especially in the country of the Osage Indians, wild horses are immensely numerous.

The ass has thriven very generally in the New World: and we learn from Ulloa that in Quito they ran wild, and multiplied in amazing numbers, so as to become a nuisance. They graze together in herds, and, when attacked, defend themselves with their mouths. If a horse happens to stray into the places where they feed, they all fall upon him, and do not cease biting and kicking till they leave him dead. †

Hogs, sheep, and goats, have likewise multiplied enormously in the New World, as have also the cat and rat, which last has been imported unintentionally in ships.

The dog, introduced by man, which at different periods became wild in America, hunts in packs, like the wolf and jackal, destroying not only hogs, but the calves and foals of the wild cattle, and even destroying horses.

The rapid propagation of domestic animals over the continent of America, within the last three centuries only, is a fact of great importance in natural history. The extraordinary herds of wild cattle and horses which overrun the plains of South America sprung from a very few pairs first carried over by the Spaniards; and they prove that the wild geographical range of large species on great continents does not necessarily imply that they have existed there from remote periods.—*Lyell's Geology.*

## TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR—I shall feel obliged if you or some of your subscribers will, for the satisfaction of myself and several of my neighbours, inform me through the medium of your journal, how it is that the name of the Marquis of Chandos, who we all consider the "farmer's friend," is not found in the list of names put forth as members of the "Central Agricultural Society."

I am, Sir, your obedient servant,  
A BERKSHIRE FARMER.

**TO TURNIP GROWERS.**—A turnip of the green topped kind was pulled a fortnight ago from the lands of Mr. Whitfield, of Cantlop, Salop, measuring 44 inches in circumference, and weighing when cleared from leaves and soil, 23lbs.

## COMPARATIVE VIEW OF OXEN AND HORSES FOR THE PURPOSES OF HUSBANDRY.

(From the Irish Farmer's Magazine.)

This subject has been treated on by many practical and intelligent men, yet it does not appear that any positive decision has been formed as to their relative merits or value generally for this purpose, and this in consequence of the individuals who have given them a trial not having sufficiently considered circumstances and localities in adopting each respectively. That the horse is faster than the ox cannot be disputed, but then the former can do but little more work daily on strong land than the latter, consequently on the score of labour on such there is but little difference, as two good oxen will be equal to the same number of horses, for the purpose of ploughing for several months in the year. It must however be admitted, that in hot weather oxen or heifers cannot endure fatigue, also that their pace is usually too slow for harrowing to advantage, and for carting on the road; and although they may be shod for this latter purpose, they can with difficulty be trained to work as fast as horses. These disadvantages which we have stated are still more evident on light soils, for on such horses will plough at a much better pace than on strong land, but the gait of oxen will be nearly the same at all sorts of work, and on all descriptions of land, and even should the greatest expedition be necessary, work cannot be pushed forward by those who solely depend on oxen for all farming purposes.

We do not however mean to assert that those who admit this superiority of the horse for labour should justify the rejection of the ox for agricultural purposes; for it will be found that on many farms it will be highly beneficial to have teams both of one and of the other: and when it is considered at how much a cheaper rate the latter can be supported, and that they are annually improving in value, and afterwards also feed quicker than those not put to labour, these qualities will be more than equivalent to their deficiencies in the comparative work of the two animals. Oxen or heifers will work well on hay and Swedes, and should any accident happen them, the loss will not be so heavy as when a horse is so far injured as to be unfit for work. Besides the outfit for a team of the former is not so expensive as that of the latter, which are also annually decreasing in value. Good three-year old bullocks may be now bought in from eight to ten pounds a head, and an expert person at the business will break them to the plough in a week or ten days, and after working for three or four years, their value will often encrease two-thirds of their original cost; neither are these beasts so subject to lameness, colds, and distempers as the horse; it therefore may be safely asserted, that the advantages of using oxen or heifers for agricultural purposes are much greater, especially in this country, than is too generally supposed.

In England the disparity of prices between the ox and the horse is much greater than in Ireland, and this is often the reason the for-

mer is so much used in many parts of that country. On the strong clays of Herefordshire, Sussex, and Shropshire, four oxen are thought necessary, and are still used, but it has been proved that two, well yoked to a suitable plough, will do the same quantity of work effectually. No doubt, could it be proved that it requires four oxen to do the same work as two horses, there would be no advantage in adopting them in preference. Mr. Lawrence, an intelligent writer on this subject, however, observes—

“ I will pledge myself, without hesitation, that a pair of well-bred sound oxen, driven by a steady and experienced man, will, barring accidents, continue annually, the quantum of labour above stated, during three years, or from four or five, to eight or twelve years of age; have in the interim, sufficient respite from labour, and quit it, at the conclusion, in good and saleable condition. The reason assigned for the inadmissibility of oxen on clays, respects only the common bred species, and such as are insufficiently fed. I should much doubt, that the generality of Scotch plough horses equal in speed the best English draught oxen, at least we do not find such to be the case here.”

These remarks are most deserving of attention, for unless a docile, thrifty, and well-formed animal is chosen for this work, there will be not only much difficulty in breaking them in, but likewise keeping them in condition during the time they are working. Mr. Cully on this subject also observes—

“ The author and his brother in partnership, at this time, employ about one hundred and fifty oxen in the draught, which is mentioned here, as a proof that they approve of drawing oxen, in many cases, after more than thirty years' experience; they use them in carts singly, and two in a plough, with cords, without a driver, where they go equally as well as two horses, though not quite so swift, and I am happy to add, that the working of oxen is becoming more general every day, as many of our neighbours are following this example.”

Oxen will not however answer all farming purposes so well as horses—they are not sufficiently fast for harrowing effectually, nor do they work so well on the road: but this in the arrangement of the number of teams necessary to accomplish the farming work can be easily regulated. With respect to the quantity of food consumed for the support of the ox or the horse, there is but little difference, but it is the quality of this article in which the difference of expense consists, for oxen will thrive well in winter on any dry fodder that is clean and sweet, getting at the same time a fair allowance of mangel wurzel or Swedes, but the horses will require the best hay and corn, regular care and cleaning after their work, besides an annual expense of shoeing.

Mr. Parkinson in his “Treatise on Live Stock,” recommends the following mode of treating cattle when young, intended for the yoke—

“ Whether calves are reared at the kit or with the cow, it is proper to tie them up, if only for a week or fortnight, as they thereby become obedient to a rope ever after, and are learnt to be led.

“ It is a good way to tie young steers, intended for the draught, together by the heads, the rope used being of a soft kind, or it will quickly render their

heads sore. Attached to the rope, there must be a piece of chain, about two feet and a half or three feet long, according to the size of the cattle, with a swivel in the middle, to turn as the cattle change sides, to prevent the rope twisting into knots. Some people put them in yoke, and hoops; but when loose in a pasture, I have known many accidents to happen to young steers so treated; for if there be any deep ditches, hollows, or holes, they are liable to push one another in. There is also one inconvenience attending the use of the yoke for draught oxen, when employed to cart hay or corn; for it is observed they will not stand, but will keep eating, and will require a person constantly by them. Nevertheless, I am very partial to yokes and hoops, for different reasons: in the first place, they are cheap and simple; and, secondly, I am of opinion, that a pair of oxen abreast would draw as great a weight as three such oxen one before another in harness: nor do I see any necessity for using horse-harness for oxen to draw in;—a cart saddle becomes the back of an ox just as well as a cocked hat would do his head. The ox is weak in the back, though very strong in the neck; but, as he draws by the withers on the upper part of his neck, not by the shoulders, a horse-collar is very improper for him. The manner of an ox's drawing is quite contrary to that of a horse; the latter is strongest in his back, where the former is weakest; but the strength of the ox is so prodigious in his neck, that, could he get his head under, he will almost overturn a house. Leather collars, housings, back-bands, a horse's bridle, tassels, &c. would become a pig as well as an ox; at an annual expense of at least from 3*l.* to 4*l.* 15*s.*, including keeping in order and repairs; while yokes and hoops may be obtained, at the highest charge, for 10*s.*, and kept in repair for 2*s.* 6*d.* or 3*s.* a year; and they are, at the same time, more becoming. I have known many instances of oxen drawing a weight in deep dirty roads, that would nearly have laid a horse fast, particularly in woods; for a beast is scarcely to be laid fast in dirt, as he will roll through; and by drawing in yokes and hoops, side by side, they are nearer their work; the advantage of which may be seen in the conduct of the carter driving a team of horses single, who, if his cart or waggon gets fast in a mire, takes off his fore horses, and puts them as near to the cart or waggon as he can fasten them; but it requires little penetration to perceive that the nearer the power is to the burthen the lighter it must draw on all roads. Oxen when double, quarter with much less difficulty than horses; they are naturally surer footed, and not so liable to slip, by their feet being cloven. When the young steers have been accustomed to go side by side, as directed, if the person using oxen for draught have two pair well broken, and these young steers be put in the middle, one pair before and another behind, there will not be the least difficulty in breaking them in, for being in company with other cattle, they will readily walk forwards. At all times observe not to put them to any work that requires irregular pulls, such as leading dung, where the cart takes more power than the shaft oxen can exert; for on such occasions the carter is obliged to use the whip, which frightens the young steers, and these, finding themselves fast, will probably draw back, and even take the strength of the two fore oxen to keep them straight. Therefore, dragging the harrow or scarifier is the best employment until they have been accustomed to labour; for they ought to have little occasion to use exertion, nor should they be at all forced, for some time, but left entirely to themselves, the driver taking no notice of them, till they begin to draw, when he should

give them encouragement. Every driver ought to feed the cattle he drives, as cattle and all animals readily know the persons from whom they receive their food; but animals have more discernment than many people are aware of, and are very sensible of good or bad treatment."

We shall now state more particularly the disadvantages of the use of oxen for ploughing, in order to bring the subject fairly before our readers—and as it has been discussed very closely by some of the most experienced men, we will endeavour to draw such conclusions from their respective arguments and practice, as may further satisfy those who have their doubts or prejudices. Oxen, independently of being slow, are soon blown in hot weather, but the latter objection is of trifling consideration in Ireland, where there is but few weeks usually of excessive heat in the year. Their slow pace however is a great disadvantage if used for seed sowing, and they also poach the land more than horses: nor does it appear that even in light soils they can be made to quicken their gait; and as expedition is at this work often of great importance, teams of oxen alone should not be depended on. It is then naturally asked, why use them for this purpose, for it is asserted by some feeders that a bullock could be fatted during the year, he might otherwise be turned to draft and would pay better selling out fat. In this opinion however we cannot agree, for beasts of this description will grow till they are five or six years old, and certainly will feed faster and to a much greater weight when they have attained their full size, than if forced into maturity when too young. Cannot then the intermediate time be beneficially employed, even admitting those animals merely pay for their keep, by turning them to labour? This, however, should be done in a judicious manner, for if over worked or under fed the object desired cannot be effected. A working ox should have sufficient grass or other food to fill himself quickly, in order that he may have sufficient time to lie down to rest; in the commencement also he should only be worked according to his strength and years, and not put to hard labour till well broken in to his work, and in summer not yoked in the heat of the day. At this season the ox team may go out at five in the morning and work till eleven, and the horse team finish the day in a press of business—compensation may be made for this extra work to the ploughman, which will ultimately save the extra expense of a second person in this department. When at hard and constant labour, oxen should get some bruised oats and cut hay, that they may fill their stomachs quicker and more effectually digest it, and regularly watered three times a day if necessary. With respect to yoking oxen, an intelligent writer makes the following observations, which being applicable to the Irish system of management among many of our farmers, we shall extract:—

"A sort of boast is often made, of drawing oxen single, like horses; but I think it a most horrid practice, either in horses or cattle. I will give a few reasons, by comparison. Can any person suppose, if the mail-coach were drawn by four horses single, one before another, that it would perform the number of miles in the same time, and with equal ease? I am of opinion, it would be with some diffi-

culty, if they performed it in twice the time. Or, were the horses in a broad-wheeled waggon, which is drawn by eight abreast, and sometimes by ten, put one before another, it is a doubt with me whether they could draw the waggon, with the weights laid upon it, at all, on difficult ground, up hills, or in mud. Mr. Cully mentions single-ox carts; the adopting of which would be a vile practice, much worse than the other: not a single argument has been adduced in their favour that will bear the test of examination. In the first place, a pole to draw the cart by, costs much less than shafts, the yoke and hoops less than a cart saddle; harness for two carts, and four oxen in harness, would cost at least 20*l.*; in yoke and hoops, about 20*s.* One man, with four oxen, either in a large cart or waggon, would take as much or more weight than the four oxen in four carts, while the four carts require each a driver; and, as all friction must consume power, less will be lost in a cart with two or a waggon with four wheels. A heavy carriage, when set going, will run with very little assistance from the team, if properly made and loaded, as may be seen in the very heavily laden stage-waggons, on hard turnpike roads, proceeding for a long distance together, and not above two of the horses, out of eight or ten, with their traces tight. Either a horse or an ox in a cart is always in distress; he has no relief from the shaking of the shafts: and it is observed by the stage-waggoners, that the shaft horses are lower in condition, with the same keep and hours of working than those that draw in the traces. But, from my own knowledge, I can speak decidedly as to this matter, having fully tried the experiment when I lived in Doncaster, and carried ale to Sheffield. The tolls at the turnpike-bars being less for six carts than for six horses in a broad-wheeled waggon, and having heard a great deal, and seen much in authors, in favour of single-horse carts, I thought, by adopting the use of them, to save money at the bars; I therefore got six carts, which were driven by two men, the usual load being given to each horse in proportion to what he drew before in the waggon, namely, a ton a horse, besides the carriage.

"The result was, the horses, with the same hours' work and the same feed, appeared much injured, and the chafing of the cart made their backs sore; and I found that to keep them in as good condition as when in the waggon, they could not trail more than half their usual burthen. Again, when I lived in Ireland, where they use cars in all farming business, I made one waggon and three large carts; each cart carrying as much dung at one load as eight cars; consequently, one man and two horses to the fields, which were near the fold-yard, in the same given time took out as much dung as eight horses and eight men or boys."

By this it is evident that the mode of yoking the oxen in cars or carts is a very material consideration, but as it is not advisable to employ them in this way, except through necessity, being too slow, it is unnecessary to dwell on this matter. It does not however follow that oxen cannot be trained to go fast, and even if this cannot be accomplished spayed heifers may be substituted, which being lighter and more active, will, except in warm weather, do as much work as horses, if well fed. The choice of cattle or horses should however depend in a great measure on the nature of the soil to be cultivated, for a horse team will do one-third more work on light soils than oxen, but on heavy land, as already stated, or where deep ploughing is necessary, the powerful chest of

the ox will accomplish as much as the activity of the horse.

We would not however, under any of the circumstances already stated, recommend the use of oxen or heifers for agricultural purposes, unless on farms where there were ample means for their support by artificial food throughout the year, for were they to be supported on natural grass or hay the expense would be nearly equal to that of horses, as by such a system a large proportion of manure is collected, and the animals maintained at half the cost incurred by the usual mode. It is, however, extraordinary that the accumulation of manure is seldom taken into consideration, although it is one of the great advantages which result from the soiling system, and we have no doubt that even if there were no other benefit the practice would be worth pursuing.

Lord Somerville's valuable observations on the breaking in and management of working cattle, and the comparative view of the expense, &c. of both animals is worthy of notice:—

"At the last meeting, in 1803, of the Dublin Society, his Lordship was informed, by a spectator of undoubted veracity, that several ploughs were entered for the prizes given; and, to the surprize of every one, the oxen beat the horses in speed: they were worked in pairs only, without drivers. These animals were not selected from the breeds most esteemed for labour, but from the oxen of that country.

"The following is his Lordship's method of working oxen: the animals are broken in at three years old, their first half year's work being easy. At six years old they are sold to graziers, and in eight months they come to Smithfield good beef. In the intervening period his work is done at the rate of about eighty acres of tillage to four oxen; and his twelve oxen, exclusive of the three-years old steers, will work thirty acres of land *per week*, when not employed in carrying lime or manure, which is ten acres per week for each four oxen, or five acres for each pair, that is, two acres *per diem* for four days in the week, for each team of four, allowing them two resting days. Thus their daily labour is completed in seven hours and a half, which gives them sixteen hours for rest. Lord S. remarks, that if they were allowed corn, they would probably do more work; and, if they did less, he would not employ them at all. He allows one horse to every 100 acres of land, for extra work, and no large number.

"Comparative expense of keep, and general savings.

- |  |   |
|--|---|
| <p>1. "Oxen are easily supported, during the severity of winter, on straw, turnips, &amp; other vegetables. Besides, as ruminating animals possess stronger digestive organs, every thing capable of affording nourishment is extracted from their food.</p> | <p>"1. Horses require to be fed with hay, oats, or beans, articles which can only be purchased at a heavy expense. The digestive powers of a horse are weak, so that, upon an average, two-thirds more are necessary for him than are required by an ox, in order to afford the same nourishment.</p> |
| <p>"2. Every day that oxen are employed, they earn more than their keep; while, if properly fed, they will require no other care.</p>  | <p>"2. A horse not only requires more stable attendance than oxen, but also often exhausts the property of little farmers, who exert themselves in order to keep a <i>fine team</i>.</p>  |

- "3. The gear necessary for a pair of oxen may be procured at a very moderate price.
- "3. The harness of a team is, in general, an expensive article, especially when the vanity of the owner induces him to have it decorated with paltry brazen ornaments.
- "4. At the end of five, six, or seven years, during which they will have more than compensated the cost of keeping them, they are in prime order for fattening; and, when fit for sale, produce to their owner a handsome sum, varying indeed according to the state of the markets, but ultimately bringing him a considerable clear profit. The same event will follow, if, through accident, the beast is lamed, or rendered unfit for work."
- "4. Horses become less valuable every year they are kept. They are liable to spasms, farcy, glanders, foundering, cankers, and a host of diseases too numerous to be here specified, from all which oxen are exempted, (these animals being subject to few diseases, except a scouring, or looseness, that reduces their value); while horses are, by sudden illness, or lameness, speedily diminished in value, from forty to four guineas, and at length become food for dogs, their hide only being in any degree serviceable to mankind."

Although in the foregoing view we think the writer has overvalued the advantages of ox in preference to horse labour, yet it proves sufficient to shew that the more general introduction of these animals for this purpose would be found most beneficial to the pocket of the tillage farmer, and this more especially in Ireland, where so large a proportion of the land is strong and deep, and the climate cool and moist. Cattle, it is known, endure wet much better than horses, and these latter cannot, in deep ploughing or strong ley, get over the ground much faster than the former, especially if the Devons are used, or others equally active and docile, there is no doubt of their superiority for work—all matters taken into consideration.

It appears from the writings of many travellers in the interior of Africa, that the ox is the principal animal employed both for travelling and the labours of husbandry, and one of them observes, "that being longer legged, and rather more lightly made than the ox in England, travels with greater ease and expedition; walking three or four miles in an hour, trotting five, and galloping, on an emergency, seven or eight." A cross from this breed might, then, be advantageous to improve our native cattle for this purpose.

Calves intended for the yoke should be made tractable and docile at an early period, and there is no doubt, although not naturally so, these habits may be acquired by proper attention in early management. In breaking them for labour, it should be done by gentleness and in company with experienced and well-tempered oxen. Bulls are often used for this purpose, being stronger than oxen, but they are not so tractable, and usually are uncertain in their disposition. Besides it would be necessary to keep them in different feeding houses, such is their propensity to

fight with each other. The following animated picture is drawn on this subject by the Editor of "British Husbandry":—

"Cattle are like most other animals, the creatures of education and circumstances. We educate them to give us milk, and to acquire flesh and fat. There is not much intelligence required for these purposes. It fares with the ox, as with all our other domesticated dependants, that when he has lost the wild freedom of the forest, and become the slave of man, without acquiring the privilege of being his friend, or receiving instruction from him, instinct languishes, without being replaced by the semblance of reason. But when we press him into our immediate service,—when he draws our cart and ploughs our land,—he rapidly improves upon us; he is in fact, altogether a different animal: when he receives a kind of culture at our hands, he seems to be enlightened with a ray of human reason, and warmed with a degree of human affection. The Lancashire and the Devonshire ox seem not to belong to the same genus. The one has just wit enough to find his way to and from his pasture; the other rivals the horse in activity and docility, and often fairly beats him out of the field in stoutness and honesty in work. He is as easily broken in, and he equals him in attachment and gratitude to his feeder."

#### AGRICULTURE IN EAST LOTHIAN.

"SIR,—In the new statistical account of the parish of Dunbar, under the head of 'Husbandry,' I observe the following:—

"The soil being dry it is easily pulverised, and cleared of rooted weeds; therefore there is comparatively but little fallow. The rotation of crops is, 1, Turnips upon two or more ploughings dunged, and generally fed off; when carried off a compost of lime and earth is generally applied. 2, Wheat, with clover and rye-grass seeds. 3, Grass fed off with cattle or sheep. 4, Potato Oats. 5, Beans drilled and dunged. 6, Wheat. Instead of oats, wheat is sometimes taken, and then the rotation is confined to four crops. This course peculiar to the parish, has been called the Dunbar system; but objections have been raised to it. Wheat every second year it is said, exhausts the soil; the answer is, that the food of plants in the soil may be exhausted by any kind of crop, while the soil itself cannot be exhausted. Where there is a command of manure, there is no system which will so richly repay the labours of the husbandman. It was adopted here, on one of the best farms, for many years, without any diminution either of quantity or quality; and in order to ascertain whether soil is injured by frequent crops of wheat, the glebe of Dunbar was properly dressed either with sea-ware, street-dung, or soot, and cropped with wheat for five successive years. The result was, an extra crop every year, and the land left in such a condition that it may produce a crop or two of any kind without additional manure. The least crop in the succession was on the third year, 10½ bolls per acre; it promised to be the greatest, but it was lodged flat as the surface soon after it came into ear. All the other crops in the succession were above 12 bolls per acre. One season, exactly suited to the soil, there were 16½ bolls per acre; and the last of the five years, crop 1834, there were 14 bolls per acre. It was ascertained that, on each of three of these years, there were more than three hundred stones of straw per acre. The soil is a sandy loam. There is another field in the parish which has produced oats four successive years, with increasing

produce and fertility. Hence it seems to follow, that land properly cultivated and manured may produce abundantly the same kind of crop in regular succession. If the food of plants is exhausted in exact proportion to the weight of crop produced, it is worthy of investigation whether the advantage of changing the kind of crop does not arise from one kind giving off food for another kind, but solely from the different modes of cultivation which different kinds of crop admit of at different seasons.'

"With regard to the Dunbar system, Sir John Sinclair, in his 'Husbandry of Scotland,' published in 1812, state that the late Mr. Hume, Eastbarns, whose farm was amongst the best in Dunbar parish, after practising this system for fourteen years, found that though by the force of manure he could grow abundance of straw, yet the grain at length turned out liker rye than wheat. In short, this rotation is very seldom pursued in East Lothian. To have a sequence of wheat, or, indeed any kind of culmiferous crop, is now generally reprobated, alternate husbandry, or the system of having leguminous and culmiferous crops to follow each other being the grand medium by which agriculture has attained its present improved state. To have five crops of wheat in succession may justly be termed 'too bad.' As to the food of plants, that is a subject on which the farmer does not trouble himself; but he knows that if he drain, clean, and manure his land in a proper manner, it will yield him as good a crop as the soil is constitutionally capable of producing, provided physical circumstances, such as heavy rains, excessive droughts, furious winds, and similar events, do not intervene, and prevent nature from performing her usual functions.—I am, &c.

"East Lothian, 9th Dec., 1835."

"N."

Here Sir, is an extract from the statistical account of the parish of Dunbar, written by a reverend gentleman well known to all of us—and, opposed to it, is the criticism of an anonymous writer, whom I cannot believe to be the person to whom rumour assigns it. The author of the "Statistical Account" describes a system of husbandry pursued in the parish of Dunbar, and his anonymous critic rebuts the statement, by telling us that the same system does not prevail every where in East Lothian! The former writer again states what he knows to be the practice of some agriculturists in his own neighbourhood, and the latter would beat him to the earth, by relating how one farmer found it to be for his interest to depart from that particular system.

Now, I think, Sir, I may safely challenge you to produce, from the dirtiest records of anonymous criticism, an attack more silly or unfair. Is it not exactly, Mr. Editor, as if you were to say that the cultivation of the hop-plant is found profitable in Kent, and I thought I could *dumbfounder* you, by gravely asserting that agriculturists could not grow it successfully in every part of Britain; or to deny that a certain course of mercantile enterprise, under particular circumstances, had conducted many to wealth and honour, because, forsooth, I could point one man who had failed from obviously not attending to some of the most important elements which enter into the calculations of every intelligent merchant.

It is not necessary that I should here defend the Dunbar system of agriculture. That it is practised successfully in the parish of Dunbar is a well known fact which should have secured the author of the Statistical Account of that parish from unfair criticism; and that the practise is found to be a good one cannot be questioned by any man who knows the

high rents paid for land in that parish—who has seen the luxuriant crops that wave over its fields—or who reflects on the number by whom it is approved, among a class of men who, for industry, intelligence, and respectability, will not suffer by comparison with any farmers in any parish in the three kingdoms. At the same time I shall feel much gratified if N will condescend to explain why he cannot perceive that the Dunbar system is alternate—that the author of the Statistical Account expressly admits the advantage of changing the crops—and that it is there proposed to ascertain correctly the cause of that advantage; but if N should be unwilling to go so far as to confess the weakness of his humanity—that an extreme desire to find fault was the cause of a temporary blindness—perhaps he will be pleased to point out how far, in respect to leguminous crops, the system he reprobates deviates so greatly from the more admired system pursued in the rest of East Lothian.

Having inquired, too, very particularly respecting that experiment at which N appears to be so greatly horrified, I found that the long series of abundant culmiferous crops had actually been obtained—that the qualities of the produce could stand a most favourable comparison with any corn of the same harvest, either in the barn, the mill, or the bakery; but I was also delighted to learn, that since the Statistical Account was written, a sixth culmiferous crop had been reaped off the same field, exceeding in quantity, and equal in quality, to any of the preceding ones. Yes Sir, that field, without any additional manure, yielded last harvest a culmiferous crop of *nineteen bolts* per acre. What N will say to such an astounding fact, I am at a loss to conjecture; for if his expression of "too bad," was applicable to the fifth culmiferous crop, I am sure his invention will be racked in order to find a term sufficiently expressive of his detestation of this further descent of the reverend experimentalist, into what, no doubt, will appear to N to be the unfathomable depths of agricultural depravity.

For my own part, Mr. Editor, I see nothing in this experiment that is erroneous in the process, or astonishing in the result. Agricultural chemistry, it is well known, is only in its infancy;—there is not a man, whose opinion is worth listening to, who will venture to say, in so far as the ground is concerned, whether vegetation depends most on the elementary principles contained in the earth, or on the texture of the soil, or on a fine, but to us, inexplicable combination of both. On the present occasion the experimentalist has attempted to obtain those elementary principles, or that texture of the earth in one way, which every agriculturist endeavours to arrive at by another. He appears to have succeeded; and that man must therefore appear truly ridiculous in the eyes of every disciple of the inductive school, who presumes to say that this experimentalist's appeals to Nature have been unwise, simply and solely because her responses to him have been so very favourable.

I am quite aware Sir, that however innocent or even laudable such attempts may be as those of the reverend gentleman to do good must appear in the eyes of many, they are eminently calculated to excite the deepest hatred in the hearts of all those "System Builders," who, like the Hercules of the olden time, are always disposed to write the *ne plus ultra* on the limits of their own narrow survey; and in that of the man, located on some upland dry hill, to which soil and climate forbid the Dunbar system to approach; but should N be in either or both of these predicaments, for his comfort I beg to remind him, that

his learned lucubrations may enjoy a respectable place on the shelves of those lunar museums, where, it is said, all things forgotten on the earth are carefully preserved; and that on his own bleak domains and amid all the beneficial changes made on the surrounding lands, no one will be angry with him for quietly adhering, as tenaciously as he pleases, to exploded errors and venerable follies.

I need not remind you, Mr. Editor, of a most eventful period in our country's history, when the present distress of our farmers, from the pressure of high rents and low prices, was experienced in a more than equal degree, by our merchants and manufacturers, from imperial edicts and continental rivalry. Nor is it necessary that I should recal to your recollection how our Liverpool and Manchester fellow-subjects triumphed over every difficulty, enriched themselves, and assisted so greatly to save their country, by casting aside old theories of commerce, bursting into new fields of enterprise, and trampling on those barriers which the system-mongers of other days had laid down as the boundaries of the mechanical powers, and the utmost limits of the English mechanist's invention; but I hint at those times, and at the struggle and the triumphs of the merchants and manufacturers of those days because, under an impression that the energies of Nature are inexhaustible in all her departments, I verily believe that along a similar path, marked out by well-conducted and *honestly* appreciated experiments—at as great a distance as may be from the "Systems of Husbandry" for 1812—and as near as possible by the side of the "Food of Plants"—our justly much valued agriculturists are in like manner to achieve for themselves that comfort and prosperity which they are so richly entitled to arrive at and enjoy.

East Lothian, Dec., 1835.

O.

### THE AGRICULTURAL QUESTION.

It is really surprising to what an extent the real state of this most important question still remains under great misapprehension; but this arises from a want of understanding of the various facts connected with it, and of the legitimate inferences which these would lead.

"No tampering with the currency" is the general cry; but this is neither desirable nor necessary. It was the Bank Restriction Act of 1797 that most seriously depreciated the currency, and by 1819 the act had become indispensable, by which cash payments were again restored. But was not the currency undermined by the act which took away the silver standard, leaving only one in gold? We had formerly a double standard of cash payments, as other nations also have still; and when gold had become scarce, credit was firmly upheld, and sudden panics and runs on the bank counteracted, by payments *in silver*. It has been repeatedly found, that in such circumstances even the Bank of England was pressed, for want of a silver standard, of fixed value compared with gold; and if this were again restored, it would prevent much evil, and enable the banks to issue freely and with safety to all concerned.

Then if banks of issue were permitted to associate with any number of partners, all responsible to the extent of their property for the notes issued by them; and if such banks were to give public security before issuing, and to be restrained from over issues by the stamp office, these measures would further secure the public interest in that part of the currency which consists of bank-notes.

And how is it that these measures of safety to the public and security to the national credit have not been adopted, so as to lead both to the solidity and extension of the general currency of the united empire, in conformity with the augmented population and the growing demands of manufactures, commerce, and agriculture? Here is the great desideratum.

It is our wise policy in respect of manufactures to protect those of the nation, and to encourage industry and persevering skill at home. We hear of the same policy as to agriculture, and yet the warehouses and capitals of merchants are taken up with Foreign corn, by which the best market is preoccupied with the produce of other nations, which has long supplanted British grain,—is now going to waste in the stores,—but is likely to come out surreptitiously on the public, in an illegal manner and unsafe condition, to the further and ruinous depreciation of the corn of the United Kingdom. Now, why is this permitted?—why are not the import dues on foreign corn, which are considered necessary to protect the agriculture of the kingdom, equalized and paid immediately on importing?—or at least, and in all cases, before taking out foreign corn in bond for any purpose whatever?

As to British grain, and especially to that grain which ripens in late bad seasons, when oats and wheat are liable to frost or mildew; and which has also the very high merit of coming with greatest advantage after the most beneficial system of improvement of the lands, and of introducing sown grasses with most competent effect, besides contributing most essentially to the morals and comfort of the people, in furnishing them with home-brewed ale and beer for private use,—it seems astonishing that barley should be taxed up to its full value when made into malt for these purposes, however the duties on spirits may be regulated.

But on these important subjects a few facts may be stated, which, on the Agricultural Question, are now urgently necessary. If these *facts* are settled first, by a general understanding, then a few *queries* would bring out the merits of this most important subject in detail, and lead to a clear and safe result. Now the *facts* are as follow—being made applicable to the County of Dumfries in particular, in order to be more easily scrutinized, and also because Dumfries-shire may be considered, in point of agriculture, as approaching to an average of British climate, soil, and husbandry—viz;

1st. The *Population* has increased in the last 80 years, computing from 1755, so as to have doubled.

The *Produce*, however, has fully more than kept pace with the population; and has been considerably improved, both in quality and variety also.

2d. The *Soil* of most of this County is let to farmers, and whatever the value of the lands may be, they are mostly to be considered as part of the farming capital.

The *Farm-houses* and other accommodations are also commonly paid for by land proprietors; and the amount of these, and of the value of the land, may fairly be considered as the landholder's part of that capital.

3d. *Live Stock* and *Implements* are the portion of that capital which the farmers have themselves to supply, along with the means of occupation and improvements for some time, until the returns come in.

4th. The *Land-rents* had risen rapidly till the peace, and the prices of land produce had given en.

couragement to improvement, and remuneration to all concerned it. But abatements of rent have been of necessity allowed by most landlords. Indeed, the present rents of land are about 20 per cent. lower than in 1814; and if they be any thing above the land-rents of 1808, it must be very little indeed,

A progressive rise of land-rents continued to take place in this county, with various interruptions, from 1656; but there is little or no rise for about 27 years.

5th. Nearly all the farm lands are enclosed and subdivided, and *in trim for a new start* in the improvement of the soil, if remunerating prices can be expected for the produce, and regular markets. But the warehouses and capitals of corn-merchants are pre-occupied with foreign produce in bond; and some of this foreign grain is in a state of deterioration, which it is proposed to take out and grind into meal and flour, to prevent it from being lost.

The Currency was very properly restored by the act of 1819 returning to cash payments; but the silver standard has been taken away, and gold only made the legal tender, instead of the double standard.

Banks of Issue are neither required to put in security, nor restrained from over-issues by the law and the public authorities; and the Bank of England hesitates to advance money on the bills of such Banks: and now does not such a state of things require serious revision?

6th. What has repeatedly happened may again occur. By subsidies, or payment of imported grain, or foreign loans, or investments in the mines or funds of other nations, or by remittances to our countrymen residing abroad, or by mercantile transactions when profit may be made—the gold of this country is liable to be drained away; and there is no agio, nothing to prevent it. The fact is also now regularly published; and in such a state there is always a risk of some degree of panic, some run upon the Bank of England; the danger of which leads to call in and contract the Bank discounts and paper in circulation; and the inevitable consequences are a diminution of the prices of labour and necessaries, and of all the returns of the productive classes. Now, in such a state, when in fact there is not gold enough to answer the demand, a silver standard combined with the gold would effectually prevent all these evils, and even the dread of them. It was a rash and ill-advised measure to prohibit so valuable an auxiliary in support of the national credit and currency; it is essential to both that we return to it.

7th. Common sense will lead to the conclusion, that, if any start in the prices of agricultural produce continue to go to foreigners or to corn-merchants, and the treasure of the kingdom go abroad in payment of foreign corn, the agriculture of the united kingdom is not treated with proper favour, nor even with fairness; and this objectionable system tends to lessen the home produce, and to hurt the state of our exchange, all under the childish illusion, that the treasure thus exported may enable foreigners to purchase our manufactured goods, though they are generally decided against this system; and the greatest manufacture in the kingdom is thus sacrificed to the senseless hope that other manufactures may partly gain, perhaps, in some degree in the course of events—a hope on which foreign courts have themselves put a seasonable extinguisher.

8th. The County of Dumfries-shire contains 644,385 acres English measure, one-third of which has been

at some time in culture, and one-fourth of which is now laid out into fields and farms, enclosed mostly, and subdivided for cultivation. The landholders allow the soil, and the farm buildings, as their part of the agricultural capital; and the amount of these, moderately computed, is equal to five and a half millions sterling; on which they certainly do not draw, of yearly rents, much, if any, above two hundred thousand pounds, liable to various burdens which reduce the returns very considerably, not leaving, it is believed, above three per cent. of the value of the lands and houses, their portion of the farming capital of this important county. They have reduced the rents by abatements as above stated, 20 per cent. in the last 20 years; and the question is, how far they can still be called on to reduce farther, if an improvement of the currency, by more ample security in the standards and in the issues, be possible?

9th. The farmers' proportion of agricultural capital is moderately computed for the whole county of Dumfries, at one million sterling; and all is ready for proceeding vigorously in the course of improvement for the great advantage of every class and every interest in the united kingdom; only let them have fair play in the sea ports; give them a secure and extending currency to answer the growing demands of the kingdom: repeal the most injudicious taxes on malt, so far as used for private consumption; raising, if necessary, the duties on spirits, &c.; and by this repeal extending the culture of barley, and relieving that of wheat, now overdone; and the agriculture of the united kingdom will be relieved without hurting any other interest, but rather to the benefit of all of them.

10th. It may be asked here, how we are to make up for the want of the malt duties? and government has itself answered this question, in practice: for it lessened the burden of interest on the national debt, when matters were not so favourable as now, by reducing the navy 5 per cent. to 4 per cent. stock; of course giving the fair option to accept, or be paid off: Now, why not carry this measure farther, when the banks allow only two per cent. on deposits? This would make some provision for the deficiency; and if not enough, why not endeavour to prevent some part of the enormous expense incurred by the nation, by a heavier tax on tobacco and other foreign luxuries? It is really a miserable aspect that is presented to us, in the annual expenditure of the poor for a poisonous weed, rendered necessary only by vulgar and filthy habits—the amount not being much, if any thing, below the whole of the malt taxes; or what may excite astonishment, not much below the whole provision for the poor of the united kingdom. It would do honour to any government that would look into this state of things—taxing luxuries of all kinds, and foreign produce, except in so far as the materials of useful industry are concerned, or the health and comfort of the people.

11th. The union with Ireland has hitherto done no good to Scotland or England, and especially to Dumfries-shire; and it never will nor can do good to either of the three kingdoms, till a firm and strong government enforce the laws, restoring peace, and allowing capital and industry to settle in that rich and populous country. Till this is done, there is nothing done there; and the agriculture of Britain must continue to be discouraged by its connection with Ireland, instead of that mutual benefit and support which the union should afford.

ADMIRAL.

5th January, 1836.

**THE FLOCK - MASTER'S COMPANION  
AND SHEPHERD'S GUIDE,** by a PRACTICAL SHEPHERD. Whittaker and Co., London.

The following extract will be read with considerable interest and benefit at this particular period; every master should furnish his shepherd with a copy; it may be the means of saving him many pounds during the lambing season.

**THE LAMBING SEASON.**

All breeders of sheep should be provided with a suitable fold-yard for their ewes during the winter season, and the time of bringing forth their young, with a hut at one corner, for the shepherd, in which should be a fire-place, as the shepherd ought to be in attendance at night as well as at day, during the lambing season, in case of accidents, wrong presentations, &c, which is often the case, and for want of assistance both ewe and lamb may be lost. The shepherd should also be prepared with proper things to make some nourishing gruel, such as the following:—

Take—Boiling water, two quarts;  
Oatmeal, two ounces;  
Common gin, three ounces;  
Powdered ginger, half an ounce.

To be made in the form of gruel, and the ewe to have half a pint twice or three times a day, when necessary, after a bad time of lambing. In cases where sheep are weak, &c. this is a good cordial, and the shepherd having a fire can warm it as he wants it. The shepherd should also have in readiness some of the following oils, in case an ewe should get torn in being roughly handled whilst extracting the lamb. When that is the case, the sheep should be dressed immediately, to prevent mortification taking place. The following oils will prevent it if applied immediately:—

Take—Linseed oil, one quart;  
Spirits of turpentine, half a pint;  
Oil of vitriol, one ounce;  
Tincture of myrrh, four ounces.

*Method of mixing*:—Put half the oil into a common brown pipkin that will hold twice the quantity, then add the vitriol, and stir it up with a stick, and put in the turpentine, and then the rest of the oil, and the tincture of myrrh, and stir it all up together; and when cold, put in a bottle for use. When these oils are used, let some be put into an old cup, and tie a small piece of tow or fine linen rag upon a small cane or stick; then dip it in the oils and anoint the parts torn. This is the finest thing that can be used amongst sheep or stock of any kind.

**NATURAL PRESENTATIONS.**—In all natural presentations, the nose and the toes of the fore feet are the parts which first come forward and present themselves. When this is the case, the ewe generally lams with ease and facility by herself, although in some cases assistance is necessary.

In the shear-hog, it being the first lamb, the passage is narrow, and some assistance may be occasionally necessary; but it should be done by a person who understands such business. *Ewes should never be meddled with unless absolutely necessary,* and then it should be done in a cool deliberate manner.

**UNNATURAL PRESENTATIONS.**—In unnatural presentations great care is requisite, as the life of the ewe is at stake. Various are the ways in which lambs present themselves; the following are some of the most common, with the mode of proceeding in such cases:—

1. When twin lambs are in such a state as to come forward at the same time, the ewe should be placed upon that side where the lamb is least advanced, by which means it will be pushed back with more ease, and the other lamb more easily brought forward and extracted; but in all cases, the operator should not be too ready in lending his assistance, but give the ewe time, as nature will accomplish what art cannot.

2. When the lamb presents the hind legs first, which is often the case, it is best to take the lamb away in that situation, without attempting to turn it.

3. When one foot presents itself, with the other and the head back, put it back gently, and get the other foot forward, then the head, and leave the ewe a little while to herself, and she perhaps will lamb, if not, it must be carefully taken away.

4. When the head presents itself with both feet back, the head must be put gently back, and the feet brought forward, one at a time, then all will be right.

5. When the feet present themselves without the head, the feet must be put gently back with one hand, and the head brought forward with the other.

6. When the shoulder presents itself, the ewe must be a little raised in the hind quarters, and the lamb worked gently back with the hand, till you can get hold of one foot, then bring it forward and get the other foot, and lastly the head, then take away the lamb gently, but do not pull unless the ewe is in pain.

7. This is a dangerous presentation, and requires a skilful person to get the lamb away. When the side presents itself, it may be discovered by feeling the ribs, the back, the belly, and by the soft yielding substance of the part, and the falling down of some portion of the umbilical cord; here the operator should endeavour to get the hind legs forward, if possible; this must be left to his judgment. But if the hind legs can be got forward, it is the best method of getting the lamb away, and which is recommended in all such cases, as the hinder parts of the lamb are the smallest.

8. It happens sometimes that the lamb must be taken away by pieces, which must be done with a blunt pointed knife, and a small hook, which is afterwards introduced to catch hold of the divided portion, which is to be brought gently away; the hind part of the ewe should be raised during the operation, by which it will be performed with greater ease.

9. Where there is a dead or decayed lamb, it should if possible be extracted, although, in some cases, it is left to rot away;—this is highly improper, and detrimental to the ewe.

10. When twin lambs, it sometimes happens that the feet of one and the head of the other present themselves, which are mistaken as belonging to the same; this may be easily found out; by pulling gently at the feet great resistance will be felt, then if the ewe be held with her head to the ground, and the hinder parts a little raised, an alteration will instantly take place, and the lamb which presented itself with the feet, will drop back, whilst that with the head will come forward, and the lambing take place in a proper manner.

**CAUTIONS.**—The natural position of the lamb presenting itself, as well as the unnatural, is now described, so that it may be easily discovered whether the lamb presents itself right or not. It is therefore recommended in all wrong presentations, that are at all critical, the taking the lamb away backwards, that it is with the hind feet first.

It is further advisable in all cases where lambs have come in a wrong position, and have need of assistance, the practice of taking the lamb away backwards, as the two hind feet only, are to be got forward; whereas in attempting to bring the lamb forth by the head and the fore feet, the former is liable to turn back, and cause much difficulty, when there seldom is any in bringing it away backwards, it being so much smaller in the hind than in the fore parts.

Observe, in assisting to bring away the lamb backwards, to pull straight forward, but remember, that when assistance is required, and the lamb in a natural position, that in drawing of it away, you should pull in rather a downward direction, to the udder part of the ewe.

Using rams of the most approved kinds, with smaller and finer heads, in the breeding of lambs, as also not letting the ewes get too full of condition previous to their lambing, and keeping them on succulent opening food, will enable them to lamb with more ease and freedom.

**AFTER-PAINS, HEAVING OR STRAINING.**—This is a complaint to which the ewe is very liable, and frequently proves fatal; it mostly happens in ewes that are fresh and in high condition, and is caused by the irritation and contraction of the uterus, as the same pain which nature uses to expel the lamb, occasionally continues for some hours, or even a day or two; in which case the parts mostly receive great inflammation and mortification, which is generally brought on sooner or later, according to the extent of the injury the parts have received. It has frequently been known that ewes in this state have been kept alive a long time, the wind being in the north, and they have perished the moment it changed to the south. You may frequently know ewes to be lost by removing them suddenly from poor to rich keep. Though they have lambed without any assistance, they afterwards are seized with heaving pains; this sufficiently proves the impropriety of keeping ewes too full during their lambing; but from whatever cause this may happen, the best mode of relief is to anoint the *vagina* with the oils recommended previously, and administer the following drink twice a day:—

Take—Tincture of opium, one drachm;  
 Infusion of carscarilla, three ounces;  
 Camphor, half a drachm.

**FALLING DOWN OF THE UTERUS.**—This accident occasionally happens after a difficult delivery. The pain is so great as to force part of the uterus out through the orifice of the shape, so as to fall down. This complaint is well known to experienced shepherds; the parts must be returned as soon as possible, and properly confined by means of a bright wire staple about one inch in the square; this is to be sharpened at the point, and forced through both sides of the shape, and the two ends turned with a pair of pliers, similar to a pig's ring, as this will keep it in its proper place. At the end of a week this may be taken out, and the ewe marked, so that after she has brought up her lamb, she may be fattened, as it is not proper for such ewes to have lambs again.

**THE DROPPING OF LAMBS.**—In some cases when lambs are first dropped, they appear as if quite dead, then the lungs should be immediately distended with fresh air, which may be done by opening the lamb's mouth, and blowing into it with your own. On dropping, the ewe should be suffered to lick them, and let the lamb suck, or if too weak, it should have ewe's or other milk given to it, being left in sight of the ewe. When the lamb droops or hangs its head, it is a bad sign. The twin ewes, after their

lambs can walk, should be removed to their pastures, as they should not be too much crowded.

**SUBSTITUTE LAMB.**—It is not an easy matter to deceive the sheep, although it is done by different arts and devices, which are highly necessarily; as some lose their own lambs, and a foster lamb is then requisite, as well for the ewe as the owner. In doing this, rub the head and different parts with some of the slime from the ewe or dead lamb, then take off the skin and fix it upon the foster lamb, put it to the ewe when hungry, and shut them both up in the dark, as the attachment will be sooner formed; but watch if the lamb sucks, as by sucking, the attachment of the ewe becomes greater. When that is properly effected, they may be turned to the rest of the flock; but when in the flock, see that the lamb does not stray away, as it may cause indifference in the ewe. The skin should be left on for some days, but the shorter the time the better, as injury may be done to the lamb by keeping it on too long.

**CASTRATING THE MALE LAMBS.**—This business is best performed when the lamb is about from four to six or eight days old, according to their strength. It is often done both at an earlier and later period, even from the day it is lambed to six months old. There are different ways of performing this operation. The general practice now, and it is believed the best, is by cutting off the end of the scrotum, the testes are then to be carefully sloughed or drawn out in a proper manner, and a few of the before-mentioned oils to be applied within the scrotum. The operation in this way is mostly performed by the shepherds. Should bleeding ensue after the operation, the best mode to stop it is by small pledgets of tow dipped in the oils, and forced into the orifice.

**SUPPORTING THE EWES AND LAMBS.**—As soon as the lambing season is over, and about all the lambs drawn or castrated, the most particular points are over; the ewes with their lambs should be put upon portions of warm dry land, where shelter is pretty good, and the state of the grass or feed favourable, so that they may meet with no injury from the severity of the season, or want of good keep. They should be disturbed as little as possible, as remaining quiet is of great consequence, for by this necessary care and attention there will be much less loss of lambs. It is also requisite to have supplies of early green food of the turnip or artificial grass kinds, as by these means the milk of the ewes is greatly promoted, a circumstance of material consequence, for if lambs are stinted at this early period, they never do so well afterwards. The best way is to have plenty of ryegrass, cole, rape, &c.; they then go from the rye to the water meadows, (if you have any,) if not, to the layers, being constantly in hurdles, with full room to fall back. You should have two or three hurdles with the slats upright, so that the lambs may run through with more ease to eat the tops of sweet morsels, before the ewes; by this means they will do well till they are weaned.

**WEANING THE LAMBS.**—This requires some nice attention, but is generally understood by sheep breeders, and requires but little to be said about it. It is generally performed when the lambs are about four or five months old, at which time they are taken from the ewes, and confined in a pretty good pasture, and the ewes put quite out of hearing, where they cannot disturb the lambs. They will be a little uneasy at first, but that will soon disappear. Their pasture should be fresh and good, and the lambs will proceed with their growth without receiving any check.

## A TREATISE ON THE NATURE OF TREES AND PRUNING OF TIMBER TREES.

By  
SILPHEN BALLARD, Simpkin and Marshall, London.

We subjoin the following extract from this unique little work, which should be in the possession of every resident in the country, interested in the subject:—

Mr. Thomas Baylis, who is well acquainted with the nature of trees, and by whom my attention was first directed to the baneful effects of pruning, planted a bed of about five hundred Pear trees, at Ledbury, in the county of Hereford. Sixty of these trees were left entirely unpruned; all the others were pruned, with naked stems, as trees generally are in nurseries. The sixty unpruned trees had no advantage in soil or situation; yet, on an average, their growth in a few years was at least three times greater than that of the pruned trees. The unpruned trees were much better formed, for transplanting into orchards, than the pruned ones; their stems were furnished with strong thorny branches; these branches, in addition to the other good offices they had performed and were performing, to enable the trees to outgrow the pruned ones so far, made excellent natural fences for each against injury from cattle. It is not my intention to enter into an argument about the management of fruit trees, this experiment with the pear trees is only mentioned to show that the opinion that pruning decreases the quantity of growth, has been confirmed by experiment; but I cannot refrain from stating my regret at the present deplorable state of the orcharding in this county. The great ignorance of the nature of trees displayed in the management of apple and pear trees, almost dismays me in the attempt to point out the errors that are fallen into by the cultivators of timber-trees.

The apple and pear trees, in this county, are generally rendered fruitless at an early age through ill-treatment. The apple tree, in particular, dies overpowered by the numerous injuries inflicted on it by its misjudging and officious cultivators. At a time of life when it should be in its greatest prosperity, it is falling to pieces with premature old age; its limbs are, one after the other, blown from its rotten trunk; and it may truly be said, that the apple-tree seldom dies a natural death, its death being generally occasioned by an accumulation of injuries.

**THE MUSHROOM STONE.**—It was sent to Mr. Thornburn, of Murth, from Calabria, in Sicily, with directions to give it a little water when it appeared dry, which was generally three or four times a week, in dry weather; and, in the course of a fortnight after I received it, a couple of mushrooms made their appearance, which grew to be very large; I think about nine inches in diameter. They were porous beneath, in place of gill, as in the common mushroom; consequently they appeared rather to be a species of *Boletus* than a species of *Agaricus*. However, they were of excellent flavour, and the ship captain who brought the stone home told me that it produced three mushrooms at sea, which he said were very fine. In three or four weeks after the two above mentioned were gathered, three or four more came up, and so on, for the first year. The second year it was not quite so productive; and, in 1833, my successor informed me that the mushroom stone was nearly exhausted. I think eight or ten of such stones would supply an ordinary family with mushrooms for two or three years.—*Gardener's Magazine*.

## STATISTICS OF DUMFRIES CATTLE MARKETS.

(From the Dumfries Times.)

“We take the merit this week of presenting to the public the annexed interesting view of the Dumfries cattle market transactions during the last three years, on the general accuracy of which the fullest reliance may be placed.

*Number of cattle shown in Dumfries market from January 16, 1833, till December 30, 1835—*

1833.—Total number shown, 46,364; deducted, supposed to have been twice shown, 1-5th part, 9,272; leaving actually sold, 37,092, which, at an average of 6 <i>l</i> , 10s per head, amounts to £240,098	
Passed through from Galloway for the South without stopping at Dumfries, 5,692, which at an average of 8 <i>l</i> , 10s per head, amounts to .....	£48,382
Total, .....	£289,480
1834.—51,304, deducted, supposed to have been twice shown, 1-5th leaving a total actually sold of 41,044, which at an average price of 6 <i>l</i> per head amounts to .....	£246,264
Passed through from Galloway for the South without stopping at Dumfries, 4,309, which, at an average price of 8 <i>l</i> . amounts to .....	34,472
Total, .....	£280,736
1835.—46,640, deduct, supposed to have been twice shown, 1-5th, leaving a total actually sold of 37,312, which, at an average of 4 <i>l</i> , 15s per head, amounts to .....	£177,232
Passed through from Galloway for the South, without stopping at Dumfries, 3,650, which, at an average price of 6 <i>l</i> , 10s per head amounts to .....	£23,725
Total, .....	£200,957
1833, .....	£289,480
1834, .....	280,736
1835, .....	200,957
	£771,173

“The cattle actually sold in Dumfries market during the last three years, thus appear to have yielded no less a sum, even at the low price quoted, than £771,137 sterling. From the tables it will also be seen that the value of the cattle which passed through the town of Dumfries on their way to the south, without stopping or being sold in the market, during the period, would amount to £106,579—making a total of £877,752.\* This is altogether exclusive of the value of the immense quantities of stock sent to the south from the ports of the district by steam conveyance, and by land by the different roads eastward of Dumfries, besides the great numbers sent to the Edinburgh, and Glasgow, and other northern markets. The value of the black cattle exported from this district therefore, during the period mentioned, may be safely estimated at fully one million and a half of pounds sterling.”

\* Our contemporary has fallen into a numerical inaccuracy in adding the assumed value of the cattle driven through Dumfries to the sum of £771,173, in which sum, by his own showing, it is actually included.

We will not differ from our contemporary in regard to the number of cattle exposed for sale in the Dumfries market in the course of the three years to which the above extract refers,—and thus far his statistics may afford some information to the general reader,—but we are much inclined to differ from him in regard to some of his hypotheses, and some of the conclusions to which he has arrived. He sets out, as the reader will observe, upon the supposition that not more than one-fifth of all the cattle shown have been shown twice. Now, if any one will for a moment reflect upon the frequency with which the words “a considerable number remained unsold,” or words of similar import, have been used in the weekly reports, and take into account that by the jobbers who have pasture at no great distance from town, many cattle are exposed not only twice, but three or four times, or perhaps still oftener, before they are sold: and still further, take into account that grazing cattle passing from one jobber to another, or to some of our more speculative farmers, are often sold several times in the season, he must, we think, come to the conclusion that not nearly four-fifths of the number shown have been sold only once and exported from the district. Besides, how many of those sold are young cattle bought to supply the place of more aged stock, and actually not sold for exportation for twelve months, or perhaps two years from the date of the purchase? We have no proper data to go upon to say with certainty the real proportion between those exposed for sale and sold for export; but had our contemporary assumed three-fifths instead of four-fifths, we suspect he would only have been approximating to the truth.

There is another circumstance in our contemporary's report which particularly calls for attention,—that is its total silence in regard to the number of cattle sold or exported which are not bred within the range of country to which the report refers. How many of them, we would ask, are Highlanders, either grazed in the locality only for a season, or driven direct from the north? How many of them are Ayrshire cows, Irish cattle, or some other breed? In short how many of them cannot be considered as cattle drawing wealth into Dumfriesshire or Galloway? Where, then, taking all these circumstances into account, is the million and a half obtained by this district for cattle exported from it within the time specified.

One word more with our contemporary upon this subject. The last published statement of the annual value of land and houses in the different Counties in Scotland which has come under our observation, makes Dumfriesshire £295,000, the Stewartry of Kirkcudbright £213,000, and the county of Wigton £143,000—in all £650,000 per annum. Now if the whole annual value of lands and houses in these Counties is only £650,000, does it stand with reason that its produce—not only exclusive of all the black cattle that are consumed in it, but exclusive also of sheep, swine, and grain—is nearly the amount of the whole value. Making every reasonable allowance for the sums requisite beyond rent to carry on farm expenses, this surely is a statement that cannot be received without stronger proof than our contemporary has adduced.

But granting for a moment our contemporary's conclusions about the million and a half, we would ask him how he comes to another conclusion in the same article, though not in the part we have quoted, namely, that the agriculturists are struggling in difficulties. Surely if black cattle alone yield nearly the amount of the value of the land they possess, their distress cannot be great! It is, however, in our contemporary's conclusion as to the value of the cattle

sold for export—not the distress of the agriculturists—that we chiefly differ from him, though even in the alleged distress of the agriculturists we think there is more said than merits implicit belief. Of this perhaps more anon.—*Dumfries Herald.*

## AGRICULTURAL ASSOCIATION.

(From the Scotsman.)

We have great pleasure in publishing the following letter addressed by Sir George Mackenzie to the Secretary of the Agricultural Association. It proves what we anticipated, that many gentlemen who are anxious to see the agriculturists raised from their depressed condition, resolutely disclaim all connection with the wild scheme of debasing the currency.

“Edinburgh, Jan. 10, 1836.

“Sir.—I have been prevented by various circumstances from writing to you sooner, in reference to the proceedings of the Central Agricultural Association. My object in becoming a member was to assist in obtaining, if possible, a Committee of the House of Commons to inquire into the real cause of Agricultural distress, without troubling itself with the proposal of a remedy until the cause was clearly brought forth. I find, however, that it is taken for granted by the promoters of the Association, that nothing can relieve agricultural distress but a change in the currency. Since I last wrote to you, I have paid more attention to the matter than I had previously done, and am now satisfied that such a change in the currency would not relieve distress; and would besides, do much harm to the country generally. I have tried the experiment for the last five years, of proportioning rent to the price of produce; and my tenants have no complaints to make. They are busy improving their farms, and reclaiming waste land; and are envied by all their neighbours who pay fixed rents. I am, therefore, entirely of opinion that it is the true policy of landlords not to attempt to bolster up rent, but to reduce it to a level with other things in the manner I have done; and that nothing else can relieve the agricultural interest. As every thing is lowered in price, so also ought land to be lowered; and let the landlords live within their incomes, and cease to regard superfluities as necessities of life. I have therefore now to request that you will withdraw my name from the list of the members of the association; and I have the honour to be, Sir, &c.

“C. S. MACKENZIE.”

“R. Montgomery Martin, Esq., Sec., &c.”

We are glad to observe, from the following abridged account of their proceedings, that the Highland and Agricultural Society of Scotland steadily adhere to their rule to exclude political subjects from their discussions. The society lately formed in London, calling themselves the Central Agricultural Association, is neither more nor less than a combination, formed with a view to effect a change in the currency.

## HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

The Anniversary Meeting of this National Association was held in their Hall, on Tuesday Jan. 12, at which there was an unusually full attendance of the members, including a large proportion of the noblemen and gentlemen of rank, property, and influence at present in Edinburgh and the vicinity. The Most Noble the Marquis of Lothian, Vice President, in the chair, supported by the Earl of Morton and the Earl of Glasgow.

The society, as the first business in the order prescribed by the charter, proceeded to ballot for the admission of new members, when the following, with many others, were duly elected:—The right hon.

Alexander Lord Elibank, the hon. Roger Rollo, Sir Charles Lamb, of Beauport, Bart., Robert Blane, Esq., Grougar, 2nd Life Guards, Edward Ellice, Esq., yr., of Ardmellie, Charles Henry Forbes, Esq., of Kingerloch, Alexander Carmichael Gibson, Esq., yr., of Castle Craig, William Hunt, Esq., yr., of Pittencrieff and Logie, Richard Trutter, Esq., of Haplaid, advocate.

SIR JOHN STUART FORBES, Bart., the Treasurer, submitted a most distinct and satisfactory view of the funds of the Society, and of its income and expenditure during the last year, under every head of charge, from the detailed report and state audited by Mr. Russell, the Society's accountant. The premiums awarded during the year exceeded 1,200*l*.

Thereafter the Treasurer noticed, that an application had been made on the part of the Society to his Majesty's Government, with a view to obtain assistance from certain funds at their disposal, applicable to purposes in Scotland. The Society's claim rested entirely on the public utility of its objects, and the manner in which its funds were appropriated. These had been fully recognised by the Government—the Chancellor of the Exchequer, at the interview the Secretary had with him, had given attention to every detail, as had Mr. Stewart, M.P., one of the Lords of the Treasury, a member of the Society, within whose department the application immediately came; the Treasury minute in reference to it, is expressed in the most favourable terms, and there seemed now no doubt that some assistance would be soon obtained. This would be of much consequence, looking to the great falling off which had taken place in the revenue of the Society, owing to the reductions in the rate of interest.

The Honorary Secretary gave a concise report of the proceedings of the Directors, and the premiums awarded by them since the half-yearly meeting in July. Since their meetings were resumed for the season, the Directors and different committees have been occupied in determining on the claims for the premiums offered by the Society for competition, in the year which has just expired. As the names of the successful candidates will be forthwith published in the newspapers, it was unnecessary, the Secretary observed, to advert now to the premiums in detail. They have been awarded in most departments of the practical agriculture of Scotland; and it is gratifying to observe, that the competition progressively increases. In the year 1835 there was six hundred and seventy nine individuals who had entered the list as competitors. Were we further to take into computation the practical ploughmen who had competed for the Society's Medal to the best ploughman at thirty eight competitions, reported within the year by the Society's resident members in the different districts—(fifty or more ploughs having started at many of these competitions)—the competitors, instead of six hundred and seventy nine, would be nearly treble that number.

LORD GREENOCK, Chairman of the Geological Committee, reported the proceedings of that committee.

DR. NEILL said, that he had been requested to announce the decisions of the Committee appointed to examine into the merits of essays, reports, and communications submitted to the Society in the course of the year, on subjects connected with woods and plantations, and on various subjects relating to husbandry and rural improvement. In a very interesting statement, in which Dr. Neill detailed the merits of the communications, he noticed that the premium of twenty five sovereigns, or plate of that value, had been awarded to Mr. Lawson, the Society's seeds-

man, for having raised and sold the greatest number of plants of *Larix Communis*, or larch fir, from seed procured from healthy native trees in the Tyrol or other regions of the Alps, to which it is indigenous. Dr. Neill gave a variety of very interesting details upon this subject.

The Secretary brought up from the Directors the following Resolutions, which were thereupon moved by Admiral Sir David Milne, seconded by the Earl of Morton, and unanimously adopted.

Resolved,

1st. That the thanks of the Society be given to the most noble the Marquis of Tweeddale, for his attendance at the late general show of live stock at Ayr, and for the energy and zeal displayed by him in forwarding the objects of the Society on that occasion.

2d. That the thanks of the Society be given to the Lords Lieutenants, Vice Lieutenants, and Conveners of the counties of Ayr and Wigton, Renfrew and Bute, and to the other Noblemen and Gentlemen of the Committee who officiated at Ayr, for their active co-operation in carrying into effect the wishes of the Society and the purposes of the meeting.

3d. That this Resolution be conveyed to Thomas Francis Kennedy, Esq., of Dunare acting Convener of the Local Committee, with the expression of the obligations of the Society for his personal exertions, through which the arrangements for the meeting were followed with such complete success, &c.

The Earl of GLASGOW, as Lord Lieutenant of Ayrshire, expressed his acknowledgments for the resolutions now adopted, and for the patronage conferred by the Society in the district on the occasion referred to. Ayrshire had not shown itself insensible to that patronage, and when the Society next visited the district, the advantages of their support would be found to have been realized in a considerable degree.

MR. CHARLES FERGUSSON said, in reference to the mention which had been made of his name, in connection with the gratifying success which had attended the Ayr show, that few situations could have been more agreeable to him, from the personal and local interest which he necessarily felt in the recent visit of this society to the county of Ayr, than to have acted as chairman of the directors upon that occasion; and he was happy to think that the anticipations which had been founded on the energy and zeal that belonged to the county, had in no degree been disappointed. He was, moreover, happy to take this opportunity of stating, that the immediate effect of the Society's late patronage had been, to originate a General Agricultural Association for the county of Ayr, on the model of this national Society, from whose exertions he could not doubt that very beneficial results might be expected to accrue.

MR. FERGUSSON reported from the Directors, in reference to the general show which takes place at Perth in the ensuing autumn, that everything relating to the adjustment of the premiums and conditions of competition had been arranged.—Fifeshire gentlemen have obtained the additional premiums they requested, and appear determined to shew what may be done with the peculiar breed of their district at a comparatively early age,

MR. NORMAN LOCKHART reported that the preparatory arrangements for the general show of live stock fixed to take place at Dumfries, in 1837, had been matured, and that the premiums had some time ago been published for the information of intending competitors and the public. These premiums are on a scale which does high credit to the counties of Dumfries, Kirkcudbright, and Wigtown, not less for their liberality than for the promptitude with

which the district had come forward with the auxiliary funds for this their second meeting. Some suggestions had been received for additional premiums for certain classes of sheep, which would receive the immediate attention of the Directors. Mr. Lockhart added, that a local Agricultural Association was also in course of being formed in this district, which would be in full operation by the time of the Society's visit in 1837, and that their cordial co-operation in the business of the show might be expected.

Professor Low said, that he had been requested, and that he had pleasure in complying with the request, to state, that application had been made for a general show of live stock at Inverness. This application had come, in the first place, from the Lord Lieutenants of the counties of Inverness and Cromarty, the Hon. Colonel Grant of Grant, and Mr. M'Leod, member of parliament for Sutherlandshire. But the Directors had been, at the same time, apprised that a requisition to the like effect was in the course of extensive signature by the proprietors and tenants of the northern counties. Professor Low stated that he had a sincere gratification in making this statement, because it was the evidence of the value attached to the Society's exertions in this branch of rural improvement, and of the desire that existed of seconding those exertions in a part of Scotland in which the Highland Society, from its very constitution, must take the warmest interest.

The meeting warmly recognised the claims of Inverness to a priority of consideration as soon as the standing resolutions allowed.

Professor Low then stated, that as chairman of the committee for superintending the society's publications, he availed himself of the opportunity presented to him of expressing the gratification felt by the committee on publications, at the state and prospects of this branch of the society's labours. The papers on every branch of rural economy received and published by the society under the name of Transactions, continued, he was happy to say, to increase in number, variety, and interest. And in place of the doubts which once existed as to the means of the society to supply materials for a Quarterly publication of their Transactions, the doubt now was, whether these materials could be comprehended within the limits hitherto assigned to them.

Professor TRAILL was charged by the Directors to lay before the society a communication from the Duke of Buccleugh, being the first report made to his Grace, of the experiments at the agricultural garden established by his orders at Dalkeith Park. This communication is made in consequence of a request at a general meeting in July, that the Duke would do the society the favour of giving them notice of the results from time to time, for the information of the members, and to be given to the public through the medium of the society's Transactions. The Professor noticed some of the more remarkable facts appearing from the present report—among which the Italian rye grass was conspicuous—it arrives at maturity sooner after sowing than any other perennial grass—its produce is nearly double that of common rye grass, and, in 1831, it ripened two crops of seed. The cordial thanks of the meeting were voted to the Noble Duke for this interesting communication, and for his readiness on all occasions to promote the objects of the society, and the best interests of agriculture.

Mr. ROBINSON, Secretary of the Royal Society, chairman of the committee on machinery, reported the different articles which had been brought before them; several appeared to them to possess consider-

able merit, and to be deserving of reward from the society.

Subsequent to the last meeting of the committee, a communication has been received from Lord Willoughby de Eresby, with a model and description of a machine for compressing peat, invented by his lordship, accompanied by certificates from persons who had used the fuel resulting from it, and who had found it applicable to the use of the smith's forge and other purposes. There has also been received a machine on a new construction, by Mr. James Newbigging, at Crosstore, adapted to the draining of bogs and meadows, by supplying a declivity, where, owing to the flatness of the surface it is otherwise unattainable. The merits of these machines will be considered by the committee at their first meeting.

Mr. HORNE of Langwell, from the committee on the veterinary school, mentioned that, from the official report of Mr. Dick, the able and zealous lecturer, the attendance at the present session has been greater than any preceding. There are sixty-four students, twenty of whom are practical men; and of these one is from New York, one from London, and one from Lincolnshire, showing that the benefits of the school are not confined to Scotland.

The SECRETARY read a letter from the Marquis of Tweeddale, expressing his regret at being unable to attend the meeting, having to preside at the Quarter Sessions at Haddington. His lordship suggested some points connected with the draining as meriting investigation.

ESTABLISHMENT FOR 1836.

PRESIDENT.

His Grace the Duke of Gordon, G. C. B.

VICE-PRESIDENTS.

The Most Noble John William, the Marquis of Louthian.

The Most Noble John the Marquis of Breadalbane.

The Right Hon. Randolph, Earl of Galloway.

The Right Hon. Thomas Robert, Earl of Kinnoull.

Sir John Stuart Forbes of Pitsligo and Fettercairn, Bart., Treasurer.

R. Macdonald Seton, Esq., of Staffa, Hon. Sec.

Charles Gordon, Esq., of Drimmin, Secretary.

Claud Russell, Esq., Accountant.

The Very Rev. George H. Baird, D. D., Principal of the University of Edinburgh, Chaplain, &c.

The item "bags," each containing twenty stone, consists of flour, oatmeal, and groats, and manufactured barley. The imports from foreign countries consist principally of timber, and a little iron, hemp, and flax, and bones for manure.

## CENTRAL TITHE ASSOCIATION.

On Tuesday, Jan. 12, a meeting of this association was held at Brown's Hotel, Palace Yard, Westminster. C. E. BRANFILL, Esq., of Uppminster Hall, Essex, in the Chair.

The CHAIRMAN stated, that at a meeting held at the same place in May, 1834, composed of delegates from the different counties, at which meeting several members of parliament were present, the association had been formed; and as there had lately been certain questions issued from the government to the different parishes on the subject of tithes, it had been considered expedient to call a meeting of the association to consider what steps ought to be taken against the assembling of parliament, which would soon take place.

The Secretary of the association, Mr. HAMILAN, observed that it was desirable, that the tithe-payers should join this association, which would be made a focus for concentrating their efforts, and a means of communication with the legislature in obtaining redress. The annual subscription from members was five shillings each, which would be found sufficient for the purposes of the association.

Mr. EAGLES, (Author of "A Legal Argument" on tithes,) proposed that the committee of the association meet once a month, and that a general public meeting be called soon after the meeting of parliament, of which due notice should be given; which was afterwards fixed for the 13th of February next. Mr. E. then drew the attention of the meeting to the distinction between the produce of land, and the produce of capital and labor; and contended that as far as tithes were made a claim on the latter, they were an infringement on both law and justice. If labor and capital were to be subject to tithes, why not tithe the productions of cotton mills, or any other manufactories which have been built on the land?

—BRADLY, Esq., said he was happy to be able to inform the meeting that district associations had been formed, and others about to be formed in Kent, and several other counties, the subject, he said, became every day more and more imposing. In many cases the tithes were completely absorbing the entire property of the parish. In the neighbourhood where he resided, the sum of ten shillings an acre was exacted, every year for tithe on farms which were let for several years at no rent at all, the titheman had virtually ejected the landlord. In one parish in East Kent, the adowson had been bought by the present incumbent for 900*l*, and he now takes 2,500*l* a-year for tithes. Such instances were not unusual, indeed such a state of things was past endurance.

A gentleman asked, whose valuation the 2,500*l* a-year was?

Mr. B. replied, Mr. Bearblock's.

Mr. COLGATE, (Author of a pamphlet intitled "Tithes, or no Tithes, that's the Question!") said that Mr. Adamson and himself attended as delegates from the Market Gardener's and Farmer's Society; having been appointed by that body to act in concert with the Central Tithe Association. No class of men were more punished by the operation of tithes than market gardeners and farmers near London, they employed a large portion of capital and labor on a small breadth of land, and consequently tithes operated as a tax on the produce of labor more than on the natural produce of the land.

A discussion then ensued, as to what ought to form the basis of a commutation; in the course of which it was contended with considerable force and ability, that land, and its natural capability of production, and not what might be expended upon it, or put into it ought to form the groundwork on which to fix a commutation: and that titling the stock in trade of the shopkeeper or manufacturer, would not be more unjust than titling the stock in trade of the market gardener, &c. The prevailing opinion of the meeting was, that any scheme of commutation at any thing like an equivalent to the present enormously overgrown claims for tithes, would be resisted as a monstrous attempt to perpetuate oppression.

## FLOUR MILLS IN AMERICA.

Amid the multitude of machinery with which the Genesee is studded, the flour establishments are conspicuous. There are now within the city of Rochester twenty-one mills, with ninety-five runs of stone, capable of manufacturing five thousand barrels per day. Twenty thousand bushels of wheat are daily required for these mills when in full operation. The immense consumption of the raw material occasioned by such an extensive manufacture, furnishes to the rich wheat-growing region around Rochester a ready market, while it draws considerable supplies from the shores of Erie and Ontario. Besides the wheat drawn from the surrounding country and from Ohio, some of the Rochester millers imported this year from Canada (subject to heavy duty) about 100,000 bushels.

Three of the above-mentioned mills have been erected this year, and considerable improvement has been made in some of the others. These three mills contain seventeen runs—which, with the seventy-eight runs in the other eighteen mills, form the total of ninety-five runs.

As has been remarked in the "Traveller's Guide," published by Davidson of Saratoga, "some of the Rochester mills are on a scale of magnitude unsurpassed in the world; all are considered first rate in the perfection of their machinery, and so effective is the whole flouring apparatus, that there are several single runs of stone which can grind (and the machinery connected therewith bolt and pack) one hundred barrels of flour per day!" And such is the character and extensive demand for the article, that, beside the quantity shipped for foreign countries, the "Rochester brands," may be seen equally at Montreal or Washington—at Quebec or New York—at Boston, Hartford, Burlington, or Bangor.—The total amount of capital invested in the twenty-one mills exceeds half a million of dollars (540,000) as was ascertained on a late accurate examination by Thomas H. Rochester, Esq., one of a Committee appointed by the Common Council to collect the statistics of the city. Williams' "Annual Register" for 1835 mentions the Rochester mills as only fourteen in number, with sixty-four runs of stone—but, by the statement here made, it will be seen that the mills are one-third more numerous, and the capital invested about double the amount given in the Register. The avidity with which mill property has been sought, and the additions made to it during the present season, indicate clearly the strong confidence of our citizens in its permanent worth.

The water-power of the two great falls at Rochester is estimated as equal to 1,920 steam engines of twenty horse power. The total value of this water power, calculated according to the cost of steam-power in England, is almost incredible to those unacquainted with such subjects—amounting as it would to nearly ten millions of dollars (9,718,272) for its annual use!

When in connection with this vast water-power we consider the great facilities which Rochester enjoys (by lake, canal, and river) for receiving wheat and other raw materials from, and shipping flour and other manufactures for, all desirable points either in the United States or the Canadas, we may more fully appreciate the importance of our present milling and manufacturing establishments, and confidently anticipate the continued prosperity and prospective greatness of the city.

## THE TIMBER TRADE.

We subjoin the following interesting table of the amount of the importations of timber and deals from all parts of the world into the port of London, during the year 1835, with the number of ships employed in the trade, and their amount of tonnage; to which is added the gross amounts of the gross imports of the ports of Liverpool, Bristol, and Hull, with the number of ships and their tonnage. The value of the timber trade to

the North American Colonies will, from the number of vessels and amount of tonnage, be duly estimated, since all the North American Colonial ports receive our home productions in exchange for timber or lumber. Compared with these advantages to the mother country, the loss of the timber trade with the Baltic and the North Sea must be obvious, as the results of our modern mock free trade system will, if fairly taken prove :—

TIMBER AND DEALS IMPORTED IN 1835.

BERKSHIRE AGRICULTURAL ASSOCIATION.

(From a correspondent.)

A respectable and numerous meeting of owners and occupiers of land took place at Newbury, on Thursday, 21st January. Besides the Chairman, William Mount, Esq., of Wasing House, we observed among the number, Robert Palmer, Esq., and John Walter Esq., two of the county members, Charles Eyston, John Thomas Wasey, William Budd, Edward Tull, Henry Tull, Richard Tull, Edward Goddard, Edward Brice Bunny, Hogan Smith Esqrs; Captain Dundas, R. N., Messrs. Job Laesley, William Clarke, George Bartholomew, John Twynam, and many other experienced and able agriculturists

The resolutions, which were moved by Mr. E. Tull, and seconded Mr. E. Goddard, were, upon a little alteration made in the second, passed unanimously.

Mr. Eyston seconded Captain Dundas in moving an amendment upon the second resolution, deprecating the agriculturists of Berkshire, putting themselves under the sole directions of the Central Board in London; these gentlemen thinking that a Berkshire Agricultural Society quite as capable of managing their own affairs, as being dictated to by the currency-mongers in London, or elsewhere. Able speeches were made by Messrs. Palmer, Walter, Eyston, Laesley, and Clarke, and Captain Dundas, as well also by the Chairman, and the mover and seconder of the resolutions.

A petition agreeably to the resolutions passed, was adopted, and is in the course of signature. The resolutions passed are as under:—

- RESOLVED.—1st. That in the present unparalleled distressed state of agriculture, it is thought desirable by this meeting that an association of the owners and occupiers of land, in the county should be formed for the purpose of representing more effectually their condition to Parliament, and of urging a general inquiry into the causes of such distress, with a view to their speedy and effectual removal.
- 2nd. That the "Berkshire Agricultural Association" unite with the "Central Society in London" as far as co-operating with them in any measure that the committee of the Berks Association may consider beneficial to the agricultural interest.
- 3rd. That a committee be formed, to consist of twenty with a chairman, which shall be empowered to form district committees, and draw up such rules and regulations for the constitution and guidance of this society, as may be deemed necessary.
- 4th. That a subscription of not less than five shillings be paid by each member on his admission to this society, to defray the necessary expences. No subscriber to be eligible to be a member of the committee, unless his subscription amount to one pound.
- 5th. That Charles Hooock, Esq., be appointed treasurer and Broome Pinniger, gentleman, honorary secretary to this society.

DAIRY AT BROCK. — DUTCH CHEESE. — The dairywoman, or rather mistress, showed us all the operations of butter and cheese-making; and I shall ever after, from a conviction of its purity, prefer Dutch cheese and butter to any other. The cheese press is a beautiful piece of machinery, ornamented with gilding, brass, and copper, all as bright as polish can make them. A large dog, placed in a kind of treadmill, turns a wheel and cylinder, and performs the operation of churning. The moulding and pressing of the cheese, and separating the milk from the butter, are all executed without bare hands ever mixing with the materials; and, as he afterwards observed, all the large dairies of North Holland, the produce of which enriches the inhabitants, are managed in the same way. — Macgregor's Note Book.

## FRENCH CORN AVERAGES.

The following are the average prices of wheat in France, at the end of December in each year, during the under-mentioned 17 years, from 1819 to 1835 inclusive, the whole reduced into English measure and money.

	The hectolitre.		equal to	The quarter.	
	f.	c.		s.	d.
1819 ..	14	86	..	34	0
1820 ..	19	90	—	..	45 3
1821 ..	14	98	—	..	34 3
1822 ..	16	3	—	..	36 9
1823 ..	15	67	—	..	35 10
1824 ..	15	1	—	..	34 4
1825 ..	15	52	—	..	35 6
1826 ..	15	90	—	..	36 5
1827 ..	21	67	—	..	49 8
1828 ..	22	91	—	..	52 6
1829 ..	21	15	—	..	48 6
1830 ..	22	25	—	..	51 0
1831 ..	22	18	—	..	50 10
1832 ..	17	99	—	..	41 3
1833 ..	14	87	—	..	34 0
1834 ..	15	26	—	..	34 11
1835 ..	14	68	—	..	33 8

The average of the whole period is 17f. 70c. per hectolitre, which is equal to 40s 6d per quarter, and it will be perceived that the average of December of the present year is the lowest of the whole period.

To compare the average prices of wheat in France with those of England and Wales, it is necessary to add 20 per cent to the latter for difference in the quality of the wheat, and the difference in the mode of taking the averages, and it then appearing that the average price of wheat in England and Wales, for the six weeks ending the 1st inst., is 36s 6d the quarter, this, with the addition of 20 per cent., makes 43s 10d; and the average price of wheat in France, at the same period, being 33s 8d the quarter, it follows that the average price of wheat is 30½ per cent. higher in England than in France.

#### THE RUSSIAN WOOLLEN MANUFACTURE.—(From an article by Mr. Leitch Ritchie in the *New Monthly Magazine* for December.)

The highest price of woollen cloth which I observed, at an exhibition of products of national industry, was thirty-two roubles the archine. Formerly the Poles were the masters of the market, but the Russians have learned to surpass them. Some of the cloths were extremely fine, but the black colours dingy instead of black. The growth of wool is a subject of extraordinary importance to Russia, and is watched with intense interest by the more intelligent of the people. Merino sheep are breeding in various parts of the country, from the shores of the Baltic to the frontiers of China; and the extensive cloth-trade carried on with the celestial empire, is now fixed on such a basis as cannot be shaken by the intervention of other nations. Formerly the Russians brought the goods destined for this traffic, from a distance of several thousand miles to the frontiers. Now, the goods—the manufactory—the wool—the sheep on which the wool grows—all are close to the market! The Russians owe this, in the first instance, to an Englishman, the late Mr. Kempton Harvey, brother of Mr. Harvey, lecturer on English literature at the University of Moscow. This gentleman, in the autumn of 1829, brought from the heart of Saxony, to the neighbourhood of Moscow, a flock of six hundred Merino sheep, with the intention of sending a portion of them to Irkutsk. A joint stock company, however, was afterwards formed, chiefly by the exertions of M. Zeidler, the governor of Siberia, and four hundred of these

valuable animals were marched into Asiatic Russia. The whole distance from Saxony was between five and six thousand miles, and the travellers took four years to their journey. This wool does not deteriorate, even among the snows of Siberia; and they suffer less by drought and epidemic diseases in summer than the native sheep. The emperor is a partner in this company, holding forty shares, at two hundred and twenty-five roubles each.\*

## COURT OF COMMON PLEAS.

## A CHEAP HORSE.

BROGDEN V. MARRIOTT.

The defendant was the owner of a horse named Partington, which he undertook would trot 18 miles within an hour. The plaintiff agreed to purchase him for 200*l.*, on the condition that he should within a month trot 18 miles in an hour, to the satisfaction of a third person agreed upon between the parties; otherwise, he was to be allowed to purchase him for 1*s.* A trial of the horse's capability in this respect was accordingly appointed to take place on a given day, but it was interrupted by a servant of the plaintiff's. Another time was then fixed upon for a second trial, and notice of it given to the person who was to act as judge on the occasion. The latter, however, not attending, the trial did not take place, and the month elapsed without the horse having performed the stipulated feat; whereupon the plaintiff demanded that the horse should be delivered up to him on payment of the shilling. The defendant refused, on the ground that the first trial had been interrupted by the plaintiff's servant, and that a subsequent trial had not taken place merely in consequence of the non-attendance of the judge or referee. —The Court decided, with reference to the first point, that as the servant was not alleged to have interrupted the trial of the horse by direction or command of his master, the latter was not answerable for his act; and that with respect to the non-attendance of the referee or judge, it was incumbent on the defendant to have procured his attendance, as he had undertaken that the horse should perform this feat to his satisfaction within the period of a month. Not having done so, he was bound to deliver up the horse on the payment of a shilling. Verdict for plaintiff accordingly.

“HE THAT KEEPETH CORRECT ACCOUNTS, BIDS DEFIANCE TO THE SHERIFF'S OFFICER.” So says the Dutch proverb. Farmers have ever been subject to the imputation of negligence in keeping accounts. Account keeping is so much simplified by “Warren's Farmers' Account Book,” that there is no longer ground for excuse. We recommend it as the most useful and best arranged book of the kind which has ever come under our notice.

In Strasburg the dogs of the city are under the superintendance of the police. Every dog is obliged to wear a numbered plate attached to his neck, the price of which is 40 centimes (4d), paid at the Mayor's office. The plate is renewed every six months, or whenever it may be lost.

\* The stock of the company, on the 1st of August, 1834, consisted of 634 pure Merinos, and 2,904 of the first and second crosses and native sheep. The stations are Irkutsk, Minusinsk, and Verkuyudinsk. The long wool of the first generation is said to be adapted for combing, and perfectly well suited to the English market.

## AGRICULTURAL REPORTS.

## KENT.

At this season we have little to notice in farming concerns, having, owing to the present frost, not much else to do but cart manure on the land, for the approaching spring crops. The wheats with us were mostly above ground before the frost set in, and if we had been favoured with snow to cover them it would have been of great service, as it would have sheltered them from the severe weather, as the late sown are at present a very tender plant. The year now commenced looks very gloomy for farmers; as, at the prices corn is now fetching, there can be no doubt in the breast of any one, but we are fast reducing our capital, for the rent must be paid out of it, otherwise the landlords must go without, for what is received of corn, &c., will all be devoured with the expenses. The corn markets this week have at last taken a turn for the better, but it is uncertain how long it will be so, we must not flatter ourselves, but it is well known that there has been a very great deal of corn thrashed for so early in the season, and sent to market; it is generally allowed that our wheat will be under the average as respects quantity.

Our cattle markets have of late been very scantily supplied with both beasts and sheep, and prices are higher. We had some excellent Christmas stock, quite as good as in any former year.

Amongst hops there has been a great deal of business done, but particularly amongst the better sorts, and prices quite as good, but the inferior hang on hand although the holders are wishing to sell.

We have very little doing amongst wools at the present moment, but there is a good deal in the hands of some growers.—Jan. 11.

## GLAMORGANSHIRE.

The winter set in about the middle of December, and occasionally the frost has been unusually severe. From the 20th to the 26th it was more intense than we have known it for many years, Fahrenheit's thermometer frequently sinking below 20 degrees; and on the morning of the 25th it was observed that it had been during the preceding night as low as 17 degrees, which is the greatest depression we have known in the vale of this country for the last 20 years. The ground has been covered with snow for the last two or three days, which is now disappearing. Such sharp weather at, and previous to, Christmas day, occasions the frequent remark that the present was an "old-fashioned winter," which never fails to ensure abundant crops. It is far more acceptable at this season of the year than in the spring for all farming operations, but it may be observed that notwithstanding the absence of hard winters of late, the crops have not been deficient. The plough has been nearly at a stand for some weeks; but the frosty weather, although not of long duration, proved acceptable for removing manure, and grass land ought to have experienced some benefits from it, the improvement of this portion of the farm being generally greatly neglected. The other operations on the farm have been limited to the thrashing and marketing of

corn, the sale of which it is difficult to effect even at the present low prices. In fat stock there is not yet any great improvement in the price, the deficient crops of turnips and hay having forced them to market, which has hitherto been well supplied as to quantity; but in the spring we expect they will be found scarce.

The continued depression of the farming interest has at last awakened the landed proprietors to the subject, and meetings, we observe, are held in various parts of the kingdom to petition parliament for an inquiry into the cause of this distress. While we are ready to acknowledge the difficulty of removing the pressure by any legislative enactment alone, we still think that some effort should be made by the government to mitigate it. In political, as well as in animal, economy, the seat of a disease should be first ascertained, and half the cure has been very properly ascribed to the discovery; and thus far, at least, the claims of the agriculturists cannot justly be rejected. Yet we do not perceive any disposition to make even this concession to the thousands of occupiers whose property continues to disappear. Had they adopted the menacing attitude of many other classes,—the householders of London, for instance,—some remedial measure would have been enacted long ago; but years of patient suffering and humble and constitutional applications for relief, meet no attention. There is, we are sorry to say, a latent feeling cherished by a certain set of politicians, not far removed from power, to pull down the landed interests, and who seem to consider that it is essential for the well-being of the state that the British farmer should be reduced in the scale of society, and brought back to the habits and living of his forefathers; while the same party loudly clamour for the advancement and improvement of all other classes. It is not enough for these economists that our "merchants be princes, and our traders become the honourables of the land," but it is necessary that our journeymen, artisans, and mechanics, have their public buildings, their trade unions, mechanics' institutes, &c. &c. The British husbandman, on the contrary, is proscribed from any participation in these improvements; he alone must return to his former state of vassalage, must be brought again to the smock frock and wooden clogs of his ancestors, and be kept in ignorance; levelling him down to the miserable and destitute condition of the Irish cottier, is now the order of the day; and the object sought for by these politicians, is being rapidly accomplished by their measures, aided by the increased facilities of combination between the two countries. We trust the English landholder will not tamely submit to this degradation of their tenantry, but will exert the influence they still possess in averting from themselves and those dependent upon them, the ruin which is fast approaching.—Jan. 13.

## STRATHMORE.

The month of December commenced with dull hazy weather from the west, which has formed the most prominent feature of atmospherical phenomena through

out the month. On the evening of the 5th, however, we experienced a pretty heavy fall of snow, which was again speedily dissolved, and a few nights of intense frost occurred about the 24th—the thermometer having during that night sunk as low as 26 degrees of Fahrenheit, which induced us to believe that we were about to be visited by something of that severity of temperature which had previously set in on the Continent of Europe. But soft and mild weather has generally prevailed ever since, and consequently considerable progress has been made since the date of our last in the ploughing of clover-ley, which is now in a forward state. Attending to winter stock, especially to that of the feeding byre, and sheep upon the turnips, together with the thrashing out of grain, and carrying it to an unremunerating market, are now the principal objects of the husbandman's attention. Candlemas rents, however, we must again remark, will speedily be looked for, and it would require a great degree of exertion on the part of the tenantry to be properly prepared to meet them at the present low prices, although the barn-yards were of inexhaustible extent; but, when we recollect that these in general are limited enough, even were prices considerably higher than they are, and that there are still many farmers who do not enjoy the benefits arising from a grain rent, it can scarcely be supposed that the scene around the "farmer's ingle" during the winter evenings, should now exhibit all that joy and contentment which was once supposed to be the *ne plus ultra* of rural felicity.

We are glad to hear that so many of the landlords in the Curse of Gowrie are now following the example given long ago, by many of the proprietors of Strathmore, in adopting a grain-rent; but we would beg leave to remind them both, that these conversions of money-rent into grain do not now in general afford the necessary relief to the tenantry; for although, in so far as the landlord's demands are concerned, the same number of bolls will always meet them, when no minimum is fixed, it is very different with regard to servants' wages, and the other necessary expenses of *tear and wear* connected with the management and improvement of a farm. These for many years past may be said to have been a constant quantity, to use a mathematical phrase; whereas the number of bolls destined for the payment of such expenses (profits being out of the question) bring at present only about two-thirds of the money they brought when the triple boll was 75s; and the deficiency of a third of such expenses is no inconsiderable sum, and quite sufficient to compel any farmer to join in the cry of agricultural distress. We are happy to see, however, that landlords both in Scotland and England are now seriously bestirring themselves, and many of them taking more just and rational views of the subject than has in general been hitherto the case: and that they now acknowledge the impossibility of obtaining any thing like *war prices* in the midst of universal peace and plenty; and consequently that the only real source of relief to the farmers lies with the proprietors themselves, provided the foolish competition that we see so often displayed in the taking of farms would permit them to exercise their rational and generous principles.

Jan. 6.

It must be of great advantage to agriculturists to procure cheap and efficient manures. Last year, several farmers in the neighbourhood of Montrose, tried the raising of turnip with crushed shells, from the village of Ferryden, at the rate of from 50 to 40 bushels per acre, and the crops have turned out equal to those raised with bone dust or farm yard manure. Several experiments are also made with it as a manure for wheat, which we hope will prove equally successful. The proprietor of Rossie has erected a machine near Ferryden for grinding shells. —*Perth Courier.*

## MANUFACTURES OF SPAIN.

Numerous manufactures of various kinds have been established in Catalonia within the last twenty years; those of cotton and silk are, however, the most extensive. Catalonia had about 200 paper-mills at work prior to the revolution in the Spanish Americas, which countries consume an immense quantity of Spanish paper every year, principally for the purpose of making cigars; these states have of late years been supplied with paper made in Genoa and other parts of Italy, in imitation of the Catalan fabric. The silk manufactories of Valencia, Murcia, and Granada, occupy a great portion of the population of these provinces. There are numerous manufactories of coarse woollen cloths in Arragon and Castile, and to protect which heavy duties have been imposed on the importation of low woollens. Fine cloths are likewise made in Guadalaxara and Alcoy, the latter establishment is very extensive. In the northern provinces tanning is one of the most active branches of local industry; the linen trade formerly carried on in Galicia and Asturias has of late almost entirely ceased. Coarse pottery is made in various parts of Spain. The iron forges in Biscay were formerly very numerous, but owing to the high price of fuel, and general want of encouragement afforded the proprietor, the works are now reduced to a very limited number, and hardly any of these concerns leave a profit at present.

The woollen stuffs manufactured in Spain are for the most part inferior in quality, owing to want of attention in preparing the wool, the colours dyed seldom being permanent.

Cotton manufactures have greatly increased in Spain of late years, and cotton spinning is carried on in Barcelona to a considerable extent. The calicoes made in Spain are mostly common; and the printed patterns are good, but the colours seldom stand.

The greater part of the silk stuffs manufactured in Spain are stout and good in quality, but want lustre, owing to the raw material being got up in a very imperfect manner, and badly thrown. Ribbons and handkerchiefs are amongst the best made articles in Spanish silks.

Spain can never succeed in a manufacturing point of view, until a thorough improvement in her agricultural system shall have increased population, and rendered labour more abundant and cheaper; there will then exist no necessity for clogging industry with so many vexatious regulations. At present the dearth of provisions, the expense of manual labour, added to the numerous holidays, the difficulty and high rates of conveyance from one province to the other, with the multitude of taxes imposed, first, on the raw material, then upon the manufactured article, and lastly, on its sale, form a combination of causes which cannot fail to impede the progress of manufacturing operations in every branch.—*Mining Journal.*

ALMANACKS.—The Bijou Almanack is indeed a veritable bijou. Only imagine an almanack which would lie commodiously within a very small vinaigrette, containing six portraits, and six poems by L. E. L., perfectly legible with the naked eye. Mr. Schloss merits the highest credit for this specimen of the art of printing, and we have no doubt will meet every encouragement.

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

SHERBORNE MARKET was fully attended by dealers and competitors for the prizes to be awarded to the owners of the best samples of wheat and other agricultural produce. A considerable quantity of corn was pitched; the barley was particularly fine, and sold freely, but not at advanced prices. The cattle market was also well supplied, and a fair share of business transacted. Messrs. Goodenough, Green, and Way, were the umpires, and the prizes were awarded as follows:—

Sovs.

To Mr. Samuel Blake, for the best load of Wheat 2  
 To Mr. Thomas Ensor, for the second best ditto... ½  
 To Mr. Robert Stuby, for the best load of Barley... 2  
 To Mr. Caleb Loader, for the second best ditto... ½  
 To Mr. Samuel Blake, for the best load of Oats... 2  
 To Mr. Edmund Bishop, for the second best ditto... ½  
 To Mr. Thomas Miller, for the best load of Beans... 2  
 To Mr. William White, for the second best ditto... ½

After the business of the day was concluded, a large party of agriculturists and tradesmen partook of a dinner at the Angel Inn, which was excellently served by Mr. Alford, and gave the utmost satisfaction; on which occasion Mr. J. M. Thorne acted as chairman, and Mr. Ensor as vice-chairman.

MELTON PLOUGHDAY FAIR, on Monday last, was but thinly supplied with horses; good horses were scarce, and made high prices. On Tuesday, the fair was well supplied with beasts of all kinds; fat ones were much in demand, and readily sold at an advance in price, some realizing 6d per lb. A good show of cart horses; good ones fetched high prices. Nag horses were much in request. The corn market was brisk: wheat on the advance.

ST. THOMAS MARKET, CRIEFF, was well attended, the day being favourable. There were about 150 cattle in the market, most of which were in good condition, and sold freely, the demand being fully greater than the supply. Good fat brought from 6s to 6s 6d per stone Dutch: beasts of this description are all bought up in the early part of the day. Lean stock was scarce, for which there was little or no demand. There were about 30 stones of cheese present, which sold from 5s to 5s 6d per stone. Lint sold at from 11s to 18s per stone, there being about 120 stones in the market.

PRESTON HORSE FAIR.—As compared with the show of horses at the fair in January, 1835, we may safely say that the quantity exhibited at the present fair has been much larger. Of the quality of the cattle we believe there has not been noted any great improvement. But the prime horses are never seen in the public streets; and we learn that the supply of this superior kind of stock has been good. With respect to sales and prices, it seems allowed by all that horses of the first class have been much looked after, and that sellers have had no reason to complain on the score of prices; (200 guineas is the largest amount we have heard been given.) The second class and inferior kinds have been numerous, but the sales were not easily made, although a slight reduction in price would have been submitted to.

AGRICULTURAL SOCIETY OF EAST LOTHIAN.—The members composing the East Lothian Agricultural Society, have engaged apartments in the Market Place of Haddington, for a Library, Reading

room, Secretary's office and Committee room. The Reading room will contain all the chief periodicals connected with agriculture, and such newspapers as contain the earliest and best accounts of the state of the markets. The Society already possess a good library, to which additions are being daily made through donations and the Society's fund.

FECUNDITY EXTRAORDINARY.—A remarkable instance of fruitfulness occurred at Dedham on Sunday last:—A ewe, of the true Leicester stock, belonging to Mr. William Downes, was slaughtered (having evinced symptoms of stupor), when it was ascertained that she was pregnant with 4 ewe and 2 tup lambs! none of which were in the least deformed.

BAKING MACHINE.—An American has obtained a patent for a machine to make ship-biscuits. The expedition with which they cut out the biscuit, says the *Aberdeen Herald*, is almost approaching the marvellous—one of the large-sized machines being capable of throwing off at the rate of from four hundred to five hundred in one minute. An experiment was recently made, and from the time the wheat was put into the mill to grind, until it was turned into well baked biscuit, 25 minutes only elapsed.

IMPORTANT TO HOP-PLANTERS.—We have already stated that the Commissioners of Inquiry into the existing laws have recommended the abolition of the duty on foreign hops, which, being 8l 11s per cwt., operates as a protecting duty to the planters of this and other counties. If the recommendation of these Commissioners be adopted, it will be extremely disadvantageous, if not ruinous, to the English planter; and it is necessary both landlords and tenants who have hop plantations, should be prepared for any attempt so perfectly uncalculated for, and so destructive to their property.—*Hereford Journal*.

CREDITORS ON TURNPIKE ROADS, NOT INJURED BY RAILWAYS.—When the Liverpool Railway was opened the creditors of the Prescot turnpike road became alarmed for their money, which they had called in. The Treasurer could not pay them, he had no funds—for the road was indebted to him. But mark the consequence—within five years after the opening of the Liverpool Railway, the Treasurer's debt of 2,400l. has been paid off, besides 3,000l. of bond debt. Such is the flourishing state of the funds of the road, that the trustees intend to pay off 1,000l. of their debt per annum. This is owing to the increase of traffic on the road consequent on the Railway.—*Tyne Mercury*.

A SMEARING MACHINE.—In a long article on sheep-smearing, and on machines for that purpose, which appeared in the *Journal* of 16th December last, it was stated that if the Highland Society were to offer a prize for the best model of a machine for smearing sheep, that before next season, one would be produced of so efficient a construction, that a sheep could be salved with the same despatch that a printer can at this moment throw off a newspaper; be that as it may, we have just learned, that on the 30th November last, Mr Robert Nisbett, Inverleithen, laid before the committee of the Highland Society, one of his single barrelled smearing machines with one aperture, which was highly approved of by them. From various testimonials, it was shown to be very superior in smearing, to any other

plan now in use. Mr. Nisbett makes no pretensions as to what may be the best materials for smearing, but confines his claim to the notice of sheep-farmers, as the inventor and maker of a machine for operating effectually.

**THE AVERAGE PRICE OF WHEAT THROUGHOUT THE KINGDOM FOR THE YEAR 1835, HAS BEEN ONLY 39s. 7d. PER QUARTER, AND THE AVERAGE PRICE OF WHEAT SOLD ON THE LONDON MARKET, 42s. 3d.**

The average of 39s 7d is the lowest aggregate rate since the year 1780, when the general average was 35s 8d, equal to 36s 9d imperial measure. In 1786, the average was 38s 10d, equal to 40s Imperial measure, since which the average has only been twice as low as 41s 2d and 41s 9d, Winchester measure, or 42s 5d and 43s imperial measure, and which occurred in the years 1787 and 1792.

**RETROSPECT OF THE WOOLLEN TRADE.**

It would hardly be possible to offer an opinion more favourable as to the general transactions of the year 1835, than by saying that they differ widely in every respect from those of the two preceding years. The excitement of 1833, and the consequent languor of 1834, have alike been avoided; and we appear to have followed that happy middle course which has conducted us to the end of the year in a state of activity, constant, regular, and beneficial.

The old stocks of goods which had accumulated during the year of excitement, and had stuck fast during the year of depression, have been worked off; and new stocks have been kept down to the point just adequate to meet the effective demand which has prevailed all this time for the home and foreign supply. At the present moment stocks of both wool and goods are very bare in the hands of manufacturers, who are not disposed to make up more than they have an immediate prospect of selling, nor to purchase more than they want immediately to make up. In fact, they have found out the philosophy of that simplest, yet most original of operations—from hand to mouth.

Of the various channels into which the produce of our industry has flowed, we consider the supply of the home trade is entitled to take precedence, as well for extent as for soundness. So low had the old stocks of goods become reduced that new supplies were absolutely wanted; they were not only sold as soon as produced, but worn as soon as sold. No serious mistake can ever be made during a state of things like this.

Foreign demand has been good, also, upon the whole, but subject to greater fluctuation, probably somewhat more speculative in its character, and, perhaps, not quite so satisfactory in its results. The trade to the North of Europe may have a right to stand first in a claim of exemption from these qualifications. The demand for Germany has been steady, and it is understood that the stocks left over the season are not excessive. The great drawback upon an effective demand for the supply of that country and the Netherlands, is the continued extravagant price of English wool, of which the goods required for those markets are principally composed. The importers in this case do not like to put their hands to their mouths, but rather keep them in their pockets; fearful that an article so very much out of proportion in price with every other article of raw produce, cannot possibly remain so permanently; and that the longer the reaction is postponed, the more violent it will prove. In Portugal the re-opening of the markets after so long a period of civil commotion

caused an extensive demand for goods, which has continued throughout the year; and, as may naturally be expected, the trade has been somewhat overdone; the markets are consequently now glutted; and whatever may be the issue of pending negotiations respecting duties, it is probable that some interval will be required to elapse ere the equilibrium of supply and demand there can be restored. The United States of America are in a situation somewhat similar, although more so for certain descriptions of goods than for others. The effect of the strife between Andrew Jackson and Nicholas Biddle led to a general, but by no means a universal suspension of shipments to that country. The consequence was, that when commercial enterprise was resumed, there was less room for its employment in some articles than in others, and those which have been most overdone have gone to the wall. Cloths are, perhaps, the worst: they have stuck on hand sometime, except at a dreadful loss. The great fire may have lightened the market, only we fear it has lightened the purses at the same time. But the whole system of trade to that market, and to the Brazilian markets, still more, requires a consideration into which we cannot now enter.

The prices of wool during all this time have suffered no very great fluctuation. As usual they were lowest at the period just preceding the clip; and as usual again, they have since got up. The supply has been abundant, as will appear on comparing the imports last year with those of preceding years. The augmentation is constant, regular, and striking; shewing that whatever probable increase of consumption may arise, there need be no fear as to supply. The following article on the subject of the wool trade is translated from a Swabian paper, wherein it appeared at the close of the year:—

“In forming an opinion as to the probable course of the wool trade next year, it may be necessary again to review the transactions of the years 1833 and 1834, more particularly as the events of the latter year have given rise to the present situation of this very important branch of commerce.

“In 1833, the rage for buying wool was so great, that any one, judge or no judge of the article, thought he could not employ his capital better than in the purchase of wool. It was quite natural that under such circumstances this trade otherwise so fair, should lose its character for solidity, and become the game of wild speculators and swindlers; since persons with capitals hardly reaching 20,000 dollars, purchased wool to the extent of 300,000 to 400,000 dollars; and prices were forced up in such a manner that the rise from June to November equalled 30 to 40 per cent. This rise, therefore, was not the effect of consumption, but of speculation; and, of course, could not be permanent. The consequences are well known: they produced the great catastrophe of the many failures which occurred in October, 1834.

“The wool trade of this year has exhibited a state altogether different. The prices of wool have not been driven up too high; wool dealer and manufacturer both went cautiously to work, and no one bought beyond his means. Although the wools of Saxony, Prussia, and Silesia have been pretty well sought up, and those of former country are now hardly to be had, yet prices have advanced in due relation only: the advance may be taken at 10 to 15 per cent., and this, even, not upon all qualities.

“The present demand for wool in Germany, as in England and France, is great: in the latter country in consequence of the reduction of the duty from 33 to 22 per cent.; and the sales of cloths, especially in the German markets, are very extensive. The sales of wool in the English market, from the time of the clip to the present period, have been important, and not without profit. In France and the Netherlands the manufacturers are in a state of the greatest activity, and there appears no ground to expect that the prices of wool will give way: on the contrary there is promise of a very lively Spring. Stocks in England are not large, and the produce from Spain must, in consequence of the

prevalence of civil warfare, for the present, or for some time to come, prove extremely insignificant. In addition to this, the competition which has latterly arisen between France and England in the cloth manufacture, may also tend to maintain the prices of wool; the more so because the injurious depression of prices by the English manufacturers, which has hitherto been usual, will thus receive a check. Even in the last fair purchases were made by several French houses in Mecklenburg of more than 2,000 cwt. of wool. In Berlin and in Austria much larger quantities were purchased for France; and in some cases better prices were obtained than the English paid. The French demand was for the superior Electoral sorts, but more particularly for fine combing wools, and was directed also to ordinary wools amongst the rest.

"If, from all this, it may be concluded that no fear need be entertained of a fall in the prices of wool, it is on the other hand to be wished that the growers would neither encourage nor try to realise expectations for the next clip beyond those which the present state of things warrants; otherwise the trade might again easily be brought into a stagnant condition, by which they themselves might again be sufferers in the end."

We consider this a tolerably fair exposition of the matter. The advance since the clip may be somewhat exaggerated at 10 to 15 per cent.; and it may be well if it be so, as it will be all the easier to come down again to the level next May. The growers, we suspect, will hardly give themselves the trouble to elevate their expectations even so high as this present advance; at all events if they take past experience into their reckoning.

But the writer of the article has committed one sin of omission; in his calculation of probable results he has quite overlooked the triumph of modern science in the application of the microscope to the properties of wool. And he has no excuse to offer; the great discovery has been wafted over in the columns of 'the only provincial English paper which is ever seen in the North of Germany'; for Mercury affirms it, and Mercury is a veritable god. This discovery must have an important influence upon future wool markets. Henceforward it can be said of no man that he is "no judge of the article." Simple demonstration supersedes the necessity of long practised skill. The Microscope becomes to wool what Phrenology is to the skull; character in the one case, and quality in the other, can be determined at a glance. The organ of mill-attiveness is a serrated fibre. The quality and value of wool will henceforward be determined like the age of a horse—by an examination of its teeth. The spectacle of the wool fairs will acquire new interest. The picturesque old towns of Germany, crowded with strangers from all parts, each one attended by his microscope bearer, like knight and squire of old, will be a sight, as Sir Charles would say, "pretty to see."

But we know no reason why the benefits of scientific research should stop here. May not that which has been done for quality be extended also to quantity? The microscope is an effective instrument in the one case: by the telescope new realms of wool may be discovered. Here is a field for enterprise! And let no apprehension be entertained as to a corresponding increase of consumers. The completion of the railway to the moon will open new markets in abundance.

The German wool growers may wonder how it is that theirs are the only prices which do not fluctuate; whilst each interval between clip and clip is employed in first getting them up, and then getting them down again. They may have wondered, also, how it came to pass that the man with 20,000 dollars only, could make purchases of wool to the extent of 400,000 dollars. They are simple as their own sheep, and know not the resources of ingenuity. We could even imagine a case on the spur of the moment which might enlighten them. We would suppose, only, that a dealer in wool was at the same time an importer of English goods. The purchase of English goods on credit we all know is an exploded system: they will, of course, be ordered on the usual terms of prompt payment. But this prompt pay-

ment is not altogether so prompt as some simpletons might imagine. It means, of course, bills at three months; and then, there must be a decent interval allowed for the goods to get fairly into the importer's possession. Say, therefore, four months cash are the terms; and if the money be forthcoming, in cash, at the end of the four months, why really there is no interest lost, and the importer may consider he has fulfilled his engagement. Here, then, we have hitch the first: four months. But a large importer, a constant, regular customer, may think himself at liberty to enjoy a little extra latitude. If he can only keep up a constant payment, on open account, he may find it possible to hang back gradually two months in arrear; and, after all, what is it? he will pay the difference of interest in account current, and the man with such a customer ought not to be over nice. Here, then, we have hitch the second, two months. Four months and two months are six months. It might happen, furthermore, that even at the end of the six months the cash is not ready. But if the creditor should press, what might the importer say? "Oh! if you will not wait, you must draw upon me *three month*: you get cash immediately in *London* for your draft." Here, then, we have hitch the third: three months. Six months and three months are nine months; and all this, our man of sheep will see clearly, is a ready-money transaction.

Now then, let us see what becomes of the goods. They arrive, in regular course, without delay, and are sold; converted into cash immediately. The importer has no need to stick out for a profit, nor even to boggle at a loss; nor need he wait the tedious process of a private contract sale: there are auction rooms every where; in Hamburg as well as at other places. He gets his cash; and he can lay it out in wool: that is the main thing. He may lose five or ten per cent. on the goods; but what of that, if he gain ten or fifteen per cent. on his wool? There is a balance of profit in his favour still; he has the nine months time for payment; he has all this time to realise his wool; and the manufacturer may have the satisfaction to learn that he is cutting out all the rest of the world in price, the rest of his own customers included.

This is a beautiful operation; but there are only certain favoured regions where it will flourish. In Lancashire, for instance, it will not do at all. The Manchester men have an awkward trick of holding out their hands about the 10th of every month. This is very unhandy, and would justify any liberal man in turning his back upon them, and leaving them in disgust, for localities where enlightened principles of trade are better understood.

Amidst other circumstances which render the wool trade especially open to speculation, one is that it requires no preparation, and that it is of general demand amongst all manufacturers. The manufacturer, after making his purchase, has then to consider what use he will make of it. If he convert it into a brown cloth, he knows right well that he restricts his market to the buyers of brown cloth, and that the buyer of blue cloth is no customer of his. So likewise, with the various descriptions of goods to which his purchases can be applied. Herein he has a judgment to exercise; a risk to run. But the wool dealer has none of this: brown, blue, black, or motley; thick or thin, twilled or plain, broad or narrow; all alike bring customers to him; and the plague is in it if he do not find a purchaser amongst them all. Here is the advantage of the wool dealer over the manufacturer; hence the temptation to speculate in wool; and hence, too, it is, that in a rising market wool is always more susceptible than manufactured goods: every manufacturer is anxious to anticipate the advance by providing himself in time. But with all appliances and means to boot, the speculation, even in the most skilful hands, does not always answer. We have heard the losses of one house, a Hebrew house too, estimated at ten thousand pounds within the last two years. The amount of loss shews at once the strength of the house, the fallibility of calculations however skilful, and the precariousness even of the wool trade.

## REVIEW OF THE CORN TRADE

DURING THE MONTH OF JANUARY.

For the sake of the farmer, and the general promotion of the agricultural interest, we should have greeted with rejoicing the formation of a "Central Agricultural Society" in London, whose *sole* object was the advancement of scientific agriculture, awarding premiums for the invention and improvement of implements of husbandry, and as a general board to take into consideration the most effectual means of affording permanent relief to the tenant; a Society, in fact, based on the principles of that union of excellence and intelligence, termed the "Highland Society." The London Society, however, opened its proceedings by making the question of a revision of the currency, the "head and front" of the meeting, from which "all sweets" were to flow in redressing the complaints of the farmers; at the same time sounding the tocsin of alarm, and endeavouring to convince the agriculturists that they are on the brink of a precipice, over which nought can save them from being precipitated but an energetic effort of forming themselves into unions, and agitating the government, until some additional boon is granted for their especial relief. These acts of dictation and declamation, and in too many instances the coalition of large landed proprietors, who have the same political bias, would give the semblance, that the Society, *sub rosa*, is intended to be brought to bear, as a powerful engine, against the present administration, who, their opponents are fully aware, have it not in their power to afford any substantial mitigation of the grievances which oppress the farmers, except as regards the commutation of tithes, and who would, themselves, were they in office, discountenance not only any legislative interference, but likewise any effectual attempt in altering and diminishing the present oppressive payment exacted by the clergy. The opinions so decisively adopted respecting the currency have not been responded to as was anticipated, and many of the most respectable country agricultural societies in this country, as well as the Highland Society in Scotland, have declined the honour of being classed with the London Central Meeting; the tone, in consequence, of the Society is changing, no specific measures being now recommended, urging only unanimity, and the junction of that interest which was at first strenuously denied as ever having been disunited, that of landlord and tenant. In France, the farmers are suffering as in England, from the low prices realized for their produce, and complaints and petitions have been made to the Council of Commerce on the subject, to which the Minister, M. Duchatel, has replied "that agriculture it is true suffers from the effect of the low prices of grain, but this suffering emanates from causes with which the laws have no power to combat, and which will continue to operate even amidst the most brilliant prosperity." In England local taxation on the farmer has been much lessened, and the poor laws modified, and with the exception of the burthen of the national debt, the other means of alleviating the farmer rests in the hands of the very men who are instigating their tenants to apply to parliament, or, in fact, any other source rather than themselves who alone can contribute in freeing them from their thralldom by a just arrangement of rent, cancelling old leases, and re-letting the land at rates in accordance with the current value of wheat, making a fair adjustment on the same principles as those adopted in Scotland, well knowing that no government, *constitutionally*, can control prices which must be alone regulated by supply and demand. No real benefit can accrue to the farmers from factious principles, their condition depending entirely on the points above alluded to, and we would not have them led astray with visionary notions, that the government *can* or *will* assist them. Much depends on their own personal exertion and science, much on the hearty and sincere co-operation of their landlords, and an equitable adjustment of the tithe system. An alteration of the currency would be only the means of affording temporary relief, to plunge them eventually deeper into misery, only tantalizing severely their hopes, without a chance of ultimate realization. These ephemeral means, therefore, cannot be too strongly deprecated, emanating as they do from the machina-

tions of political empirics. The reward of the farmer's toil and anxiety must be based on surer foundations.

The supplies of wheat throughout the month have been extremely limited, and upwards of 26,000 qrs less than during December. The early part of January the weather proved extremely cold, and as millers were fearful the internal navigation might become impeded, and the operation of the water-mills suspended, they were inclined to buy more freely, having only previously purchased to the extent of their immediate wants, and have been therefore out of stock, having, perhaps, neglected the period at which they might have come into the market at the lowest figures; prices, in consequence, advanced 1s per qr, as the month advanced, and by the payment of the dividends money became more plenty, the low prices of wheat attracted a little speculative attention, which, in conjunction with a very scanty supply and orders from the northern counties to ship the better qualities, induced factors to advance their demands fully 2s per qr more, which millers very reluctantly acceded to, and though the rise rather checked the speculative purchases, and less briskness was manifested in the trade, yet at the termination of the month, notwithstanding an increase in the arrivals, the improved rates were supported for all the better descriptions, ordinary sorts barely realizing the previous terms, and unless the imports of wheat are very extensive, the currencies are likely for the present to be supported. Bonded wheat has met with a revived demand, in consequence of the advanced prices in the United States; owing to a deficiency in the crops, holders are asking higher rates, but the offers generally are too low to tempt them to quit their stock, and therefore many of the shipments which have been made are on owners' account. Old Danzig wheat, of high-mixed quality, and in good condition, obtained only 26s, and Barletta the same rates; Neustadt red wheat, of fine heavy quality, realized also similar prices. The exports have consisted of about 5,000 qrs of wheat to New York, 7 to 800 qrs to Malta, a few hundred qrs to Madeira, and upwards of 500 qrs to Sydney.

The improved character of the wheat trade has caused flour to continue firm at the top quotations, and ship qualities, which were offering at very depressed rates, have rallied 1s per sack for the intermediate descriptions; the highest prices therefore noted last month remain unaltered. Bonded flour has been in request, and the arrivals from the Baltic and Elbe have met ready sale; the shipments have been to New York, Boston, and the West Indies; prices continuing firm, and in some instances good parcels obtaining an advance.

The averages have not sustained much variation. The duty on barley has advanced 1s 6d, the same on rye, 3s on beans, and 1s 6d per qr on peas. The duty on barley in the official averages is noted at

19s 10d, when it ought to be 21s 4d, and has remained so for the last fortnight. We have had occasion more than once to notice the inaccuracy of the government returns, and if erroneous in those figures which meet the public eye, it throws discredit on the totals published from the inspector's returns, and on which the trade are totally dependant, as only the products are printed without the detail.

The arrivals of barley, though less than the previous month, have been fully adequate to the demand; but as fine Chevalier descriptions, and prime samples of common malting barley, have formed a small proportion of the supplies, these qualities have experienced an improvement of fully 2s per qr, Chevalier sorts having been saleable at 34s to 35s; the intermediate parcels of malting barley have, however, participated little in the advance; distillers bought freely, and fine lots obtained 1s per qr more money; grinding samples have maintained fully the previous rates. Bonded parcels experienced a partial demand for export at 15s to 16s 6d, a few hundred quarters being shipped to the United States and Lisbon.

The ale brewers purchased freely the better qualities of malt, fine samples in consequence advanced 1s per qr; the porter brewers have also been in the market, but not being inclined to accede to the top quotations, the trade the last fortnight though steady, is less animated. The supplies latterly coastways have been liberal.

The importation of oats exceed that of the previous month by 28,000 qrs, principally from Ireland; the article, however, has met a steady demand, and the supplies falling off about the middle of the month, English and Scotch qualities realized an advance of 1s, and Irish of 6d per qr; the arrivals having, however, increased, the market has become languid, and the quotations barely maintained, except for good fresh horse corn. In Ireland the establishment of numerous branch banks, called *Agricultural Banks*, in order to afford accommodation to the farmers, are enabling them to controul the markets, and forcing up prices in a higher ratio than the currencies realized in this country; the free on board sales, therefore, are limited, as prices are in many instances demanded which would leave the importer to our market 1s to 1s 6d per qr *minus*. Occasional purchases of bonded oats are being made for the West Indies, and a few hundred quarters have been exported to the United States. Brew oats are held at 13s to 15s; feed, at 11s to 12s; fine, 13s.

New beans having come more plentifully to hand, have receded 1s per qr, but remain saleable at this decline; old being extremely scarce, have supported their currencies.

Peas have been a dull trade throughout the month; white boiling qualities having receded 2s to 3s per qr, and grey and maple 1s.

The difference which exists in the stock of bonded corn and flour at the end of the year 1835, as compared with the similar period of 1834, shows a material diminution in all articles during the past year. In wheat, 55,749 qrs; barley, 112,934 qrs; oats, 91,669 qrs; rye, 1,658 qrs; peas, 2,216 qrs; beans, 36,147 qrs; flour, 121,635 cwt.

During the month of January the following quantity of grain and flour has arrived in the port of London:—

	Wheat. qrs.	Barley. qrs.	Malt. qrs.	Oats. qrs.

In France, the cold weather experienced at the commencement of the month having been succeeded by a milder temperature, has thawed the ice and snow, which, aided with rain, has replenished the streams and rivers, and set the mills in full operation; the flour trade, which previously from want of supply had advanced, is now fast receding; while the finer qualities of wheat proving scarce, and in demand, are improving in value; but the ordinary qualities are too abundant to participate in the rise. Farmers are complaining of the depressed state of the currencies, particularly those with long leases, which have some years still to run; the legislature, however, decline interfering, stating that prices must regulate themselves by the natural channels of supply and demand. The sudden thaws and frosts have in some districts affected the young wheat plants, and rendered them weak and sickly in appearance, and on the borders of the Rhine many parts of the low lands had been inundated, owing to the sudden melting of the snow, and the earth, not being thawed sufficiently to absorb the moisture: grain and rape seed are both represented as suffering from the weather. At Paris the best qualities of cloverseed were held at 45s to 46s per cwt., and for which purchasers are offering freely 40s to 42s, which holders would not accept.

The Italian markets have sustained little variation in price or demand; at Leghorn white Tuscan wheat was noted at 45s 2d per qr, and red 39s 6d; Sicilian linseed 55s 5d, and Odessa and Black Sea qualities 49s 1d. At Naples, Barletta wheat, owing to the prohibition of the article being ground into flour at Marseille or other French ports

for export, has declined in value; the demand being more confined to the local wants.

The advices from the United States are more favourable respecting the dreadful fire at New York than were at first anticipated. Energetic measures were being adopted to restore mercantile confidence, both on the part of the government and merchants; and it was ascertained that the Insurance offices would pay nearly the whole of the amount on the property insured. The resources of America being extensive, and the country unincumbered with a national debt, a local calamity likely to affect the commercial interests of the nation can with facility be rectified, even if the losses had been to a much more considerable extent. Flour had improved at New York in value, Western Canal being noted at 34s 10d to 35s 7d per barrel, but not much business passing, merchants being employed in ascertaining the extent of the damage committed by the fire and devising means for future transactions. Wheat dull; Genesee nominal at 53s 2d to 55s per qr; North Carolina wheat 45s 10d to 47s 8d; Northern rye was obtaining 43s 3d per qr; cloverseed, best new, 5½d to 6d per lb. At Baltimore as well as Philadelphia, the events at New York had checked the operations of the markets; flour at both cities was noted at 30s 4d; red wheat at the former 49s 6d to 51s 4d and 52s; fine white 53s 2d; at the latter wheat was dull at 51s 4d; cloverseed fine new 28s 1d per bushel, or about 66lbs.

In North America sales of grain and flour for spring delivery not having commenced, the business transpiring was very limited, a few speculative purchases of American flour had been made at 27s 6d to 28s for fine, superfine 1s to 1s 6d per barrel higher. Lower Canada red wheat was noted at 5s 6d to 5s 9d per minot, and no samples of white Upper Canada qualities offering.

At St. Petersburg, prices of wheat had remained nominally unaltered, but rye and rye-meal steady at former rates. Linseed is quoted at 38s 4d to 39s 8d on contract, but the quality of the new seed having been deteriorated by the frost, deterred purchasers from entering into contracts to any extent. At Riga contracts for the delivery of crushing linseed have been made at 39s 5d to 40s 5d with all the money paid before hand, and 41s 4d with an advance only of 10 per cent. Wheat remains nominal at 23s 7d to 27s 10d, while rye realizes 24s 10d. At Konigsberg a little speculative demand has existed for fine high mixed wheat at 26s to 27s per qr. Beans have been bought for English account at 16s to 17s. Tares are held at 15s 6d to 16s, and linseed at 43s to 44s. At Danzig little business has been transacted during the month in grain, though there is a great choice of quality from the 300,000 qrs of wheat now in granary, the very finest high mixed samples of 1834 and 35 however form but a small proportion of the bulk, and are held steadily at 26s to 27s. Intelligence has been received from Poland,

that the immense fall of snow which had been experienced at Danzig had prevailed all over the country, and the parties in the interior appear to be so sanguine that the river communications with the Vistula will be navigable next spring, that they are building already the barges upon which they intend floating down their wheats; if this succeeds, and it seems probable, upwards of 20,000 qrs of fine Volhynian wheats will be added to the store, but which it is represented will not be obtained under 28s per qr. Rye is noted at 15s. At Rostock, as well as Wismar, the prices of the best qualities of wheat are ruling extremely low, and parcels weighing 63 to 64lbs may be purchased at 20s 6d to 21s 6d. Rye is noted at 18s, and peas at 18s 3d. In Holstein and Denmark, wheat of good quality can be bought at 20s to 21s. Rapeseed is scarce, and the better parcels are held at 32l per last. Tares are to be procured at 21s. At Hamburg the wheat trade has sustained little variation. Rapeseed has been in request, and is held at 33l per last for spring delivery. Cloverseed has been firm at the advanced rates; fine new red being noted at 50s to 53s; white, 63s to 69s per cwt. In Holland the adoption by the chambers of the projected law for levying an additional duty on the import of foreign grain, has improved the value of the stocks on hand, and prices were tending towards an advance, though the measure is still much depreciated by the merchants.

LIVERPOOL.

WEEK ENDING JANUARY 23.

ENGLISH WOOLS have also sold well, particularly the fine sort of skins. An advance of nearly 1d per lb has been realized on most descriptions.—Per lb.—Combing fleeces, 17½d to 18d; Down ewes and wethers, 17d to 18d; ditto tegs, 19½d to 21d; super. skin, 17½d to 18½d; head ditto, 13½d to 15d.

SCOTCH WOOLS.—The improvement we noticed in last week's report is quite maintained this week. The transactions of the week have not been so extensive as last, but above an average amount has been done at very full prices. We must now quote the stock of every description of Scotch Wool as unusually small for the period of the year.

	per stone of 24 lbs.
Laid Highland Wool, from 10s 6d to 11s 0d	
White do. do. ....	14s 0d 14s 6d
Laid Crossed do. ....	14s 0d 16s 0d
Washed do. do. ....	15s 0d 17s 0d

Washed do. do. ....	22s 0d 25s 0d
White do. do. ....	28s 0d 38s 0d
Import for the week.....	29s do.
Previously this year.....	502 do.

IRISH WOOLS, the stock of which is small, have also sold tolerably well, though the improvement has not been so great as in Scotch and English.—Per lb.—Irish fleeces, mixed lots, 16d to 16½d; ditto wethers, 15½d to 16d; ditto hogs, 17½d to 18½d; ditto combing skin, 14½d to 15½d; ditto short skin, 13d to 14½d. Import for the week, 128 bags; previously this year, 157.

FOREIGN WOOLS.—The sales of foreign wools have been on a moderate scale. Some transactions have taken place in Smyrna, Russian, Portugal, and other sorts, at good prices.—Per lb.—Odessa, fine, 2s to 3s 6d; Portugal R. 1s 5d to 1s 7d; Portugal, low marks, 1s ½d to 1s 2½d; Spanish R, 2s 6d to 2s 9d; Spanish, F, S, 2s 2d to 2s 4d; German fleeces, 2s 2d to 2s 6d; German, assorted, 2s 6d to 2s 9d; German lambs, 2s 6d to 3s 6d; New South Wales 2s 3d to 2s 10d; Russian, 2s to 3s 6d; Buenos Ayres, 4d to 5½d; Mogadore and Barbary, 4½d to 6d. Import for the week, 504 bags; previously this year, 1,361 ditto.

FOREIGN.

FEBRUARY 1.

The private trade continues very brisk.

The annual statements of the importations of Wool into Great Britain have been completed, and they show the following results:—

The importations into London in 1835 were, of German 19,513, of Spanish 7,721, of New South Wales 9,462, of Van Diemen's Land 6,623, of Cape of Good Hope 824, of South America 2,302, of Italian 646, of Russian 7,561, of East India 773, of Bombay and Turkey 4,531, and of Sundries 119 bales—making a total of 60,075 bls.

The imports into Liverpool were, South American 7,762, New South Wales 3,275, Van Diemen's Land 402, Portugal 2,675, Turkey 2,129, Italian 2,041, Russian 1,060, New York 1,026, East Indies (a new article of import) 624, Spanish 296, and of Sundries 942, making a total of 22,205 bales.

The imports into Hull last year were, of German 42,230, Danish 1,175, Russian 473, Italian 156, Portuguese 97, and Sundries 189—44,320 bales.

The imports into Goole were 7,599 bales of German Wool.

The imports into Bristol were, Spanish 565, and Russian 49 bales—Total 614 bales.

The imports into Gloucester were, German 290 bales.

The total imports were of German Wools, 69,632 bales; of Spanish 8,562 bales; of Australian and Van Diemen's Land, 19,762 bales; and Sundries, 37,127 bales; making a total of imports into this country last year of 135,103 bales. The total imports of 1834 were, 136,150 bales, and, of 1833, 120,680 bales. The principal increase this year has been in the importation of Australian, Van Diemen's Land, Cape, and South American Wools.

BONES.

Since our last there has passed the SOUND, or by ELSINORE, and the GREAT BELT, 1 ship loaded with Bones, bound for England.

## THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

[Our object in appending a Political Companion to the Farmer's Magazine, was to put our readers in possession of the opinions of the most talented journalists of the day, on both sides of any important question which might come under discussion. We trust, therefore, that in giving insertion to articles, which seem opposed to the agricultural interest, we shall not be considered as acquiescing in the doctrines therein advanced, our sole purpose being to enable our readers to estimate the truth or detect the fallacies of the arguments advanced.—ED. FARMER'S MAGAZINE.]

## IMPORTANT TO THE LANDED INTEREST.

(From the Tipperary Constitution.)

We beg to call the marked attention of our readers in general, but more especially those who belong to the landed interest, to a matter of a most important, and, at the same time, startling nature, which we are about to bring under their notice. It will be at once perceived by the information which we shall lay before them, that a very insidious attempt is about being made, by which the value of landed property will be deteriorated, in as much as a considerable branch of the agriculture upon which it mainly depends, will be seriously affected. But it is not alone the great possessors of landed property who will feel the pernicious effects of the projected measure; every class of society in this country—the holders of free grain, the farmer, the trader, the manufacturer and the peasant, all will be more or less operated upon by its injurious tendency. Not to keep our readers any longer in the dark with regard to our meaning, we extract the following from the *Liverpool Albion* of the 12th instant:—

The holders of Foreign wheat on bond, are industriously pursuing a plan of organization to obtain from parliament liberty to grind the stocks on hand, and export the produce.—This measure, we believe, experience has shown to be fraught with so much mischief to the fair trader, that we shall continue to give it our consistent and most strenuous opposition.

Some of the most active of the advocates of this measure here were, a few years ago, when the then Government were seeking information as to the expediency of adopting some general measure of this nature, most violently opposed to such a scheme, and it met with their decided disapprobation. At that time they manifested sincerity in their opinions, for they were not holders of foreign wheat—now they hold largely.

This proposition to obtain the intraction of a law, by a side wind, would probably never have been supported here, had not the fraudulent, but gainful traffic in Foreign corn, through the Isle of Man, been stopped by the legislature in the last session. To accomplish this measure, it is well known we took a leading part.

The imports of corn from the Isle of Man into this port alone, were, in

1833.	11,970 qrs.	Wheat	2,202 qrs.	Barley
1834.	13,595	do	1,524	do and
to June 30, 1835.	9,618	do	5,117	do

while from the 1st July, when the importations of Foreign corn into that island ceased to this date, the entire quantity only amounts to 2,597 quarters wheat, and 1,315 quarters Barley; but the accession to the stock of bonded wheat at this port, in a few weeks after the repeal of the Act before alluded to, amounted to 17,411 quarters by vessels destined to call at the Isle of Man for orders.

From these statements our friends, the Irish millers

and merchants, will be enabled to judge of the sincerity of the advocates of this scheme, in their assertions, that "their plan is a direct bounty to the Irish and English millers to export flour made from Irish and English wheat, and is therefore a bounty to the Irish and English farmers."

There have already been purchases of Irish flour, in this market, for the purpose of being exported to the North American States, and these will go on extensively as soon as the navigation to our colonies opens; but how the letting loose of 500,000 quarters of Foreign wheat, to be manufactured for a like purpose, can operate as a bounty, or increase the export of British or Irish flour, we must leave to wiser heads than ours to determine. We again recommend the millers and merchants of Ireland, to communicate on this subject with their parliamentary representatives, that they may be prepared to oppose the application whenever it comes before them.

Upon the intelligence of such a projected measure reaching them, the Limerick Chamber of Commerce, and the Clonmel Commercial Association, with a promptitude and decision which is highly creditable to them, immediately assembled, and expressed in strong terms their opinions condemnatory of them; and passed energetic resolutions to oppose and frustrate, if possible, by every legitimate means of petition and remonstrance so designing and perilous an expedient. We call earnestly upon the landed proprietors to imitate such an example; nay more, to out rival them by the vigour and perseverance of their exertions; for it behoves the commercial bodies of this country to look with apprehension on the coming evil, and to endeavour to avert the threatened mischief; far, far more imperative is it upon the great landed proprietors, the peers, and the representatives of the people, to be up and stirring, and unite in one firm, consistent opposition to the inroads of an interested speculation which may benefit the few by the injury of the many. It is a question of vital importance to their tenantry, and the aristocracy should recollect that in furthering their interests and protecting their rights, they are best securing and advancing their own. The property of the landlord must increase or be depressed in the same ratio with that of the farmer; for there is an identification of interest between them, that never can be separated; and any blow that is aimed at the latter must strike home at the rent-roll of the former. It is therefore imperative on the landed proprietors to make a vigorous stand against this measure. The representatives of the manufacturing towns in England will support it in obedience to the cry of their constituents for a cheap loaf; our representatives have their own and their electors interest at stake in it. Let them then meet, consult, and petition against its

introduction amongst us; let them in their places in parliament, expose the selfish and interested nature of the intended plan, and then vote resolutely against it, and thus protect themselves, their tenantry, and the commercial interests of this country from the infliction of a serious and manifest injury.

The following are the spirited resolutions entered into at Limerick and Clonmel:—

CLONMEL COMMERCIAL ASSOCIATION.—At a meeting of the Clonmel Commercial Association, held the 4th of 1st month (January,) 1836.

Letters and other intelligence have been submitted to this Body, mentioning that an application is intended to be made to the legislature for liberty to manufacture the Foreign wheat, now in bond, and export flour in place of it, and that those interested are concerting measures to effect this object.

That when permission was before granted, to admit Foreign wheat, then in bond, to be manufactured, and for every quarter of wheat released for this purpose, a proportion of flour was to be exported, still admitting a part of the produce to home consumption, the operation of this liberty was attended with very injurious effects to the legitimate holders, fair traders in, and manufacturers of, British corn, and led to frauds of an extensive and destructive nature.

And as no impediment now exists to exporting bonded wheat, and manufacturing it elsewhere, we look on the present contemplated scheme, as opening a door that will be used as a cover for fraud; enabling holders of bonded wheat to introduce a part of its produce into home consumption, to the manifest injury of the farmers, present holders, fair traders in, and manufacturers of, British wheat.

Resolved—That in case of such an application being made that petitions to parliament be prepared and presented on our behalf, stating our views on the subject, and soliciting the protection of the legislature, from the injurious effects of such a scheme.

Resolved—That our president be instructed to communicate with such Peers, Members of Parliament, Landed Proprietors, Commercial Bodies, and Merchants as may be considered most interested and influential, calling their attention to the subject, informing them of our opinion, and requesting their co-operation in opposing the project, and thereby preventing its depreciating tendency.

CHAMBER OF COMMERCE.—Limerick, 18th Dec. 1835.—Information having been laid before the Directors of this body, that meetings have been held by speculators in Foreign grain, to petition the legislature to grant permission to grind the Foreign wheat now under lock, for exportation in bond, and that active measures are now in progress in the different ports in England to effect this object.

Resolved—That the operation of a partial law, such as now contemplated, when tried in 1825, led to fraud of the most extensive and destructive nature, and instead of serving the interest of the importers of Foreign grain, effected but an uncertain relief, while it did injury to the legitimate trade of the kingdom.

Resolved—That at any time the manufacture of Foreign wheat for exportation would be injurious to the agriculture and the trade of these kingdoms; but now, at a time when both are depressed to an unprecedented degree, such a measure would at once entail incalculable loss on the farmers, the millers, and the agriculturists of Ireland.

Resolved—That a petition to the legislature on this subject be prepared, and presented at the opening of Parliament.

Resolved—That the different Commercial Bodies all over Ireland be presented with copies of these resolutions, requesting them to co-operate with us, and to engage the attention of the agricultural interests in their districts to a subject of such vital importance to them.

#### AGRICULTURAL DISTRESS.

It has been for some time the practice of certain Tory Journals to arrogate to themselves the title of

“the farmer’s friends,” and to brand not only the whigs but all the conductors of liberal journals who take a different view of the means by which the condition of the tenant is to be ameliorated, as enemies to the landed interest, and eagerly seeking its destruction. To such we recommend the perusal of the subjoined able article from the “OLD ENGLAND,” a paper established for the express purpose of *upholding and inculcating high Tory principles*.

We have ever shown ourselves alive to the reality and severity of agricultural distress. Regarding the agricultural interest as the most important subject of national concern; as the basis of national prosperity, and the permanent security for our national glory and pre-eminence, we have ever held up its condition and prospects as the most vital question which can engage the attention of the Legislature, or of those who study the diffusion and perpetuity of public happiness. We have not, however, closed our eyes to the fact that among those who talk most vehemently on the subject are some whose motives are questionable, and whose statements are consequently liable to suspicion. It cannot be denied that among both landlords and occupiers there are some whose difficulties arise from improvidence or ill-management. Those who raised money on mortgage to purchase, during the height of war prices, land which will not now defray even the interest of the money so raised, can only claim the commiseration due to all disappointed speculators. Those practical farmers who have not availed themselves of the improved and economical modes of husbandry which have enabled more enterprising or alert competitors to undersell them in the market are only suffering the natural penalty of the purlind and the tardy. It is in agriculture as in every other pursuit; if discoveries are made which reduce the cost of production, the market will decline, to the inevitable injury and ultimate ruin of those who from prejudice or ignorance neglect to avail themselves of the advance of knowledge. When the application of science to machinery enabled the manufacturers of cotton goods, for instance, to produce their commodity at a lower rate than formerly, the price of such goods necessarily became reduced in proportion, and if any manufacturers had persisted in the costly and infartificial system formerly in practice, they must infallibly have been victims to the success of their rivals. So it is in the production of food. The application of science to the process of agriculture within the last twenty years has been scarcely less ingenious, persevering and successful than to any branch of our manufactures, and it is undeniable that the reduction of prices has to a considerable extent been owing to the operation of this cause.

A reduction thus occasioned is certainly no cause for lamentation or alarm. It argues equal prosperity to the producer, and a more abundant supply to the consumer; it is a national benefit, and an injury to such individuals only as have wilfully or negligently brought their difficulties upon themselves. At all events, it is perfectly clear that such fluctuations are utterly beyond the reach of legislative control. No sane man can think that any legislature can or ought to tax the ingenious, enterprising, or economical farmer in order that he may not be able to bring his corn to market at a cheaper rate than his neighbour who displays none of these qualities, or possesses them in an inferior degree. This is not a question of free trade or restriction; it is not between the foreign and the home grower; it is simply between the enterprising and the prejudiced, the diligent and the slothful, the economical and the profuse. We do not ask at what rate the French or the German, or the Polish, or the American farmer can afford to sell his produce and set that standard up for the regulation of the British farmer, but whether any British farmers can successfully prosecute their calling in the present state of the market; and if we are answered in the affirmative, we then proceed to inquire who are they who cannot, and why can they not?

We are aware that, if we accept the statements of

some among the most prominent members of the Agricultural Associations, we shall receive a flat and most decided negative to our first question. If we are to take the statements and calculations of Mr. Cayley, for instance, without qualification, we should believe that the cultivation of land cannot be carried on without absolute loss, irrespective of rent altogether; that if rents were annihilated to-morrow, the possessions of landlords reduced to such lands as they hold in their personal occupation, and every occupier endowed with the fee simple of his farm, cultivation would still be a losing pursuit. It is impossible not to suspect such a representation of inordinate exaggeration. Two simple facts convict it of absurdity; one, that on numerous and extensive estates, which it would be easy but invidious to specify, every individual tenant finds himself able, not only to meet the demands of his landlord, as well as all other charges on his occupation, but fully to maintain that becoming respectability which every friend to his country must wish to see enjoyed by the yeomanry of England; the other, that if a return were made of the price fetched by all the agricultural landed property sold during the last season, it would be found that the average exceeded, rather than fell beneath, thirty years' purchase on the actual rental. No one can believe, under such circumstances, that land is really less than worthless.

Startled by these obvious inconsistencies and exaggerations; impressed with the deepest consciousness of the vital and paramount importance of the agricultural interest; aware of the utter impracticability of any attempt to revert to a paper currency; and painfully alive to the inextricable embarrassments in which the encouragement of delusive hopes among the farmers must entangle any administration which may be formed, we have over and over again pressed upon the sincere friends of the farmer, as well as upon the farmer himself, the necessity of boldly, unsparingly, and narrowly, investigating the second question we have submitted. We make no apology for renewing our importunity. We have seen, in an Edinburgh paper, an able article on the subject, which fully confirms the view we have taken of the causes of much of the existing distress. The writer deals in facts, and facts are stubborn things. He enumerates the improvements which have been effected of late years in the husbandry of East Lothian, and demonstrates that they have enabled the agriculturist to produce his staple at so reduced a rate of expense, as to account for a very considerable reduction in the market without infringing on his due profits. The farmer who does this must necessarily drive his rival out of the field, and his exclusion is beyond the reach of legislative redress. If one farmer employs three, four, or five horses to do what another effects by two—if he employs two labourers when another employs one—if he wastes his seed and his land by broadcast turnips—if he allows straggling hedges to occupy and impoverish valuable land—if he persists in inefficient and obsolete modes of drainage—if he threshes his corn by the clumsy and tedious apparatus of a couple of sticks cut from the nearest plantation, while his neighbours employ steam or water power, what help can he expect from Gods or men? He is the victim of his own obstinate prejudices or impenetrable ignorance, and however we may deplore his gradual but inevitable ruin, we cannot but admit that he has no one to blame but himself.

We renew, therefore, earnestly and sincerely, the advice we have formerly given to the Agricultural Associations, and to all who would prove themselves the farmers' friends. Let them apply themselves, not to the diffusion of opinions about the currency, which, whatever may be their abstract justice, can never be reduced to practice; and which, if acted on, could only afford a temporary relief, but to the circulation among the farmers of plain and practical information as to the state of husbandry in various districts, and the resources which art has opened to them for the more available application of their means, carry to the homes of those who, from their position and habits, are unable to collect information for themselves, the results of more fortunate experience. Much is said of the prodigious

benefits which the agricultural society of Scotland has conferred upon the farmers of that country; and it is, in fact, scarcely possible to exaggerate them. But why do we hear so little of *the means* by which these objects have been attained? Why do we see so little effort made to copy or to emulate them? Contrast their publications with those circulated by the Cayleys and the Bernards in the south. They are not filled with interminable dissertations, or rather mystifications, about political economy and the currency thimble-rig; they contain practical details of experiments in every department of the science of agriculture; they tell the farmer how his neighbours drain their land, fatten their cattle, or arrange their rotation of crops; what new manure has been tried: what new varieties of grain or grass have been introduced; what are the actual or probable necessities of the market. This is what the farmer wants, and not soporific lectures, which seem to emanate from the pragmatist sciolism and prosy pomposity of a Robuck, grafted on the georgical propensities of Triptolemus Yellowley. Most confidently do we hope that the robust and masculine sense of the English agriculturists will spurn this mischievous drivelling, and imitate the practical wisdom of their Scottish brethren.

### THE AGRICULTURISTS.

(From the Maidstone Gazette.)

“Man is the sport of circumstances, when  
The circumstances seem the sport of men.”—BYRON.

By the nature of his avocation, removed as he is “far from the busy hum of men,” the farmer is more liable to be imposed on than persons of almost every other profession. From the absolute necessity of constant personal superintendance over the affairs of his farm, he may be almost said to live out of the world six days of every week, and only to come out and wrestle in worldly knowledge with his more bustling countrymen on market days. We may add to this, that generally speaking the farmer has a distaste for politics. He loves to cultivate old English feelings, and he would rather extend his hospitality to all around him, and exchange social sentiments with his old friends by his own fire-side, than be appointed principal wrangler to the most powerful faction that ever existed. So long as he can gain an honest and respectable subsistence by his industry, his knowledge of business, and his capital,—he never even murmurs, and we would defy the most smooth-tongued corruptionist to make a political tool of him. There are times, however, which, as George Washington once said, “try men's souls.” When the farmer finds that all his industry is exercised in vain, that all his professional knowledge is of no avail, and that his capital is fast sinking—it is not surprising that the very nature of the farmer should be changed; and that, from a domesticated, quiet, and contented man, he should become a very discontented one. Burke says that the most insignificant insect in the creation, endeavouring to rescue itself from cruelty and oppression, is a respectable object in the eyes of its creator; and the farmer, living as he does in a land of plenty, and knowing that he practises frugality and economy, and works late and early, to maintain an honourable station in life,—would be more contemptible than any beast of the field, if he were to remain contented, under present circumstances.

In order, however, that he may take the proper steps to relieve himself, and direct his discontent in a direction that will be likely to remove its causes, he must, first of all, ascertain what the causes are? He need go no further than his own farm-buildings

to find a practical illustration of these causes. He will see, perhaps, a dozen sturdy willing horses in his stables, whose business it is to work hard, in order to raise the crops of the farm, and who would never jib nor grumble, providing they have the fair share of food, lodging, and attention, to which their industry is entitled. These are the types of the farmers. In the stock-yard will be found an equal number of black cattle, who seem to have reversed Moliere's maxim, and to live only for the purpose of eating. These are the unproductives, the sinecurists, the pluralists, the non-resident and overpaid parsons, the lady pensioners, the unnecessary place-holders, and the whole tribe of tax-eaters,—the only allegorical distinction between these persons and the stock, is, that the stock at their death generally repay people for the trouble and expense they have occasioned during their lives, but the *genus* of unproductives proverbially never die. In the farmer's barn will be found a host of lesser and still more worthless vermin. These are the human rats, the toad-eaters, the tuft-hunters, the conductors of Tory newspapers, and the hangers-on of aristocracy,—for whom no employment is too dirty—no mode of living too nauseous.

What would a farmer do, if he found that his live stock were daily getting fatter and more comfortable, while the ribs of his horses, the more valuable animals, were in danger of cutting their skins? Would he not make an inquiry into the matter? If he found, by that inquiry, that this state of things was caused by the stock eating too much, and the horses eating too little, what would he do next? Would he take part with the stock, on their promising to refrain from devouring so much in future; would he endeavour, like the Frenchman, to teach his horses to live without eating; or would he not rather side with his tried friends, who were starving, and take measures for stinting the idle, in order that the industrious might get the fair reward of their labor?

What is now the position of the farmer? Having discovered that he himself was daily growing poorer, while the parsons and the corruptionists were daily growing richer, he three years ago, set about inquiring into the cause. He was told that it was in consequence of heavy burdens and low prices. It is impossible to raise the prices, as it is to teach his horses to live without eating. What then will relieve him? He must reduce the burdens of the country. He must lend his aid towards procuring a reduction of rents, the abolition of tithes, of sinecures, of unnecessary places, and of unmerited pensions. It is as absurd that he can expect (even if he were unfair enough to try) to throw the burden from his own shoulders on to those of the manufacturers,—as to suppose that he can benefit himself by taking the scanty allowance from the horse that turns his threshing machine, and giving it to the horse that draws his plough. The farmer and the manufacturer must rise and fall together, and (although it may be some time in adjusting itself) every thing that benefits the one must ultimately benefit the other. If the manufacturer gets cheap bread, the farmer and his men get cheap manufactures, and *vice versa*. It is not so, however, with the unproductive classes. It is their interest that there should be dear bread and cheap manufactures. This would be also the farmers' interest, if his rent and tithes were regulated by the price of corn. It is notorious, however, that the parsons and the landlords stick to their high-price rents and tithes, let the price of corn be what it may. It is their object to get high rents and tithes, with *high prices*, if possible; but at all events—high rents and tithes; and when, as at pre-

sent, the low prices are ruining the farmer, they will tamper with the currency, enact another set of useless corn laws, or do any thing but what they ought to do.

It is this class of gentlemen who are now endeavouring to bend the simple farmer to their interested purposes by cajoling him into joining agricultural associations, whose real object is that of supporting the present corrupt and unjust system of taxation, by which the property and industry of the poor only are taxed, while the rich contribute comparatively nothing to the expenses of the state. The following is a remarkable passage as to the objects of these associations. It is from a new paper called "The Agriculturist," published under the encouragement of the central agricultural association in London, and will make the farmer open his eyes:—

"We unhesitatingly tell the landlords of the United Kingdom, that if they now waver, they are lost,—their *power*—their *property*—aye, even their *persons* are in danger! Gladly do we rejoice at the cry that has gone forth from the metropolitan press, *against rents*; the *Times*, and the *Chronicle*, the *Globe*, and the *Courier*, the *Sun*, &c.—journals of every possible shade of politics, have, under the accursed influence of the monetary interest, concentrated their power in the metropolis, and harked each other on in the shout of "*down with rents*,"—DOWN WITH RENTS! If rents are to be annihilated, what becomes of the aristocracy? Can the monarchy be upheld without that intermediate class of society, which equally poises the scale between a fierce democracy on the one hand, and an unbridled despotism on the other? Fatal delusion! Aye, fatal even to those who plan, and endeavour to carry into effect, their terrific projects; for with the downfall of our balanced Constitution, a debt of £800,000,000, created in a depreciated currency, would not withstand the first moment of convulsive anarchy—an anarchy in which every thing that makes life worth preserving would be sacrificed. Our lands would be untilled; workshops silent; our manufacturers beggared; our peasants starved. Fire and famine would desolate the land; our green fields would be fertilised with the bodies of the best and noblest of our fellow creatures, and our beautiful rivers empurpled with their gore; until a devastating and sanguinary struggle would be terminated in a long night of despotism, when some iron-clad heel would trample with impunity on the dearly-earned liberties of our country."

Here's a terrible clutter. Let us just see what it is all about. It seems that the real cause of the farmer's distress is seen and acknowledged by all classes, and that the organs of every party cry "Down with the rents," of course meaning, "*reduce the rents*." The champion of the landlords considers lowering the rents equivalent to *annihilating* them. This annihilates the aristocracy, which annihilates the monarchy, and knocks down the national debt. He at length launches us in into "*convulsive anarchy*," and starts off on a voyage of discovery after untilled lands, silent workshops, beggared manufacturers, starved peasants, fires, famines, green fields fertilised with our fellow creatures, beautiful rivers empurpled with gore (!), devastating and sanguinary struggles, long nights of despotism, iron-clad heels, and "all that sort of thing."

Now this fustian may be very well adapted to raise the sensibilities of young ladies in a fashionable novel—but it is not precisely the sort of logic which will impose on slow thinking people, who judge of these matters by the old fashioned rules of common sense. From what we know of the farmers, *they* are not to be caught with such nonsense.

The farmer has no greater enemy than the man who would disguise from him the truth, from the fear of offending his prejudices. All we ask is, that the agriculturist will consider carefully before he again

suffers himself to be made the tool of the landlords. The more he considers, the more convinced will he be that he can only gain relief by a reduction of rent, tithes, and taxes.

### TITHES.

(From the Mark Lane Express.)

In another part of our paper will be found an article entitled "PROPOSALS for a REDEMPTION OF TITHES," by C. Hillyard, Esq., to which we invite the especial attention of our readers. Mr. Hillyard is president of the Northamptonshire Grazing Society, and is very generally known as one of our best and most intelligent practical agriculturists. His whole life has been devoted to agriculture and all subjects connected with it; his devotion to the cause cannot be for an instant doubted, and his pen has been frequently exercised in advocating the interest of the British farmer, and in communicating useful practical information. It is scarcely necessary to observe that in addition to the general feeling which subsists as to the advantages which would result from a commutation of tithes, the circular which has been recently issued from the Home Office, and which appeared in our paper of Monday last, seems to indicate an intention on the part of Government to take some steps upon the subject in the ensuing session. Mr. Hillyard's *brochure* should be circulated as extensively as possible, not only for the purpose of making known the sound practical view which he takes of the subject, and for the purpose of eliciting the opinions of others upon his plan, but also of inducing others to follow his example by communicating their views on the question.

It affords us much satisfaction to find that the opinions of Mr. Hillyard, as to the *increased quantity of wheat produced*, and the consequent effects upon its present price, coincide with the opinions very recently advanced by us. In the introductory part of his article he says—

"Ireland sends double—or perhaps treble—the quantity of wheat to this country that it formerly did. Immense quantities of fen land, from being effectually drained, now produce most abundant crops of wheat, while they formerly produced only uncertain crops of oats. Much down and common land is now inclosed, and produces wheat. Add to these circumstances, that the system of agriculture is improved: that the land (excepting the very poor soils, the produce of which will not repay the expenses of cultivation), now produces more grain than it formerly did. Under all these considerations, it appears to me, to be quite out of the question to expect, for some years to come, anything approaching to high prices for corn. The present price of wheat would certainly be too low to govern the price for redemption, for land cannot be bought at such corresponding low price of produce: besides which, the present very low price of wheat is, in a great degree, caused by two successive abundant crops; and, when that *superabundance shall have ceased, the price must rise.*"

From this it will be perceived that he

ascribes the present *unnaturally* low price of wheat to an extraordinary supply, which will speedily adjust itself as soon as that supply shall be in some degree lessened. His observations upon the mode in which rent should be estimated, although expressed in half a dozen words, are conclusive and incontrovertible. Speaking of tithes he says—

"The value of the tithes of all descriptions of land ought to be estimated by the value of the produce which can be raised from it, by common husbandry; that value ought also to govern the estimation of rent."

*The value of the produce which can be raised upon the land* is the criterion for estimating the amount of rent, which we have always contended for when discussing that question. It would be a work of superogation to advance arguments for the purpose of proving how great the benefit to agriculture would be were the amount of tithe to be paid permanently fixed. We prefer quoting the closing observations of Mr. Hillyard, and at the same time observing that we shall be most happy to give place in our columns to communications upon the subject of tithes, by the speedy and final settlement of which question we feel confident more benefit would be derived both by landlord and tenant, than from any other measure affecting the landed interest, which can emanate from the legislature, be the Government Whig, Tory, or Radical.

"Amongst the many national advantages to be obtained by a commutation, or redemption of tithes, there would be this. There is a great deal of inferior old pasture land, with very bad herbage, that would, were it not for the extra demand made for tithes, repay the expenses of ploughing up and taking two crops off it, well cleaning it, liming it, draining it if needed, and then sowing—say three parts of it—down again with grasses suited to the soil; thus finding additional employment for the poor of the parish, and thus enabling the occupiers to keep as much stock, or more, on three parts of their farms, as they had formerly done on the whole."

### GUERNSEY AND JERSEY.

(From the Public Ledger.)

The importation of French agricultural produce into the islands of Guernsey and Jersey is at length felt to be a hardship by the resident farmers, and excites their opposition. Its operation on our own corn-market has been the importation into England of large quantities of French corn, *via* Guernsey and Jersey; or the release from local consumption of that produced in the islands, their home markets being supplied with the French grain. In either case it has led to a direct evasion of the English corn laws. The Guernsey and Jersey farmers—principally the latter—have now put forward a project for stopping the continued importation of French produce, as most injurious to their interests, and as unnecessary as far as the local consumption is concerned; which project, it appears, is resisted by the British residents—those whose food is somewhat cheapened by the present state of things, and whose commercial transactions would be likely to be affected by any change. Public meetings are now holding at Jersey on the subject.

## THE REVENUE.

*(From the Morning Chronicle.)*

We lay before our readers the Revenue Accounts, from 5th January, 1835, to 5th January, 1836.

The Revenue of the year ended 5th January, 1835, was 43,043,876*l.* For the year just ended, it is 42,430,207*l.*

The transference of several branches of Revenue from the Excise to the Customs, accounts for the increase in the Customs of the year of 1,686,211*l.*, and of a decrease in the Excise of 1,621,295*l.*

On the Year's Taxes, the decrease is 374,091*l.* In the Stamps, too, there has been a decrease of 12,925*l.* The increase in the Post-office is very great—57,000*l.*

The decrease on the year amounts only to 613,669*l.*—a sum beneath the calculated amount of reductions.

The Revenue for the quarter ended 5th January, 1835, is 11,399,561*l.*; for the quarter just ended 11,572,528*l.* The increase on the quarter is 333,749*l.*; the decrease 210,732*l.*, leaving a balance of increase on the quarter of 172,967*l.* The increase is in stamps 64,085*l.* and Post-office 22,000*l.*

We have already alluded to the transference of the tea duties from the Excise to the Customs. The public must be aware that of late years there have been very large reductions of taxation. Considerable branches of the revenue have been altogether cut off, others have been materially reduced. Where, therefore, the amount of receipts is sustained, it is a proof of the increased and increasing resources of the country. Of one thing we are certain, that to those who have imputed principles inconsistent with good faith and good government to our present rulers—to those who have exhausted all terms of reproach in describing them as Jacobins and Democrats—enemies to order, prosperity, and peace—the present state of the country must be gall and wormwood. There is a dilemma from which they cannot escape. They must either admit that peace, prosperity, extension of commerce, and improvement of manufactures can exist concurrently with ignorance, incapacity, treachery to the King, and treason to the constitution; or, they must admit that, the ends of good government being attained, the existence of a good government cannot be greatly controverted.

## BONDED CORN.

*(From the Times.)*

The leading houses in the corn trade, both in London and in Liverpool, are earnestly occupied on the means of bringing to maturity a plan, which is said to have been already under the consideration of Government, by which foreign wheat under bond is to be allowed to be manufactured into flour and exported. Many of them are extremely sanguine on the subject, and believe that it will become the medium of introducing a new and valuable branch of trade into this country, without prejudice to the agricultural interest. They conceive, too, that under proper regulations no fraud can possibly be committed under it. They are preparing, consequently, a series of resolutions, which are to undergo discussion at meetings of the trade, to be convened for this purpose. The ultimate object at which they aim is that of establishing of the principle that all foreign wheat now bonded in this country, or hereafter to be brought into it, may either be manufactured into flour for exportation, or reserved for the home market, at the option of the importer. But they would be content, it seems,

in the mean time, to accept permission only so to manufacture the stock of bonded wheat on hand, which would allow a fair trial of the experiment without the slightest risk of compromising any other interest in it. They have little doubt that such an experiment would be so satisfactory and conclusive in its results as to lead to the enactment of a general law on the subject. The chief argument by which they seek to reconcile the English agriculturists to the measure is, that a large proportion of wheat of home growth would be used along with the foreign, in order to produce flour of the requisite fineness for the West Indian and South American markets. From the efforts now making in a trade of so great extent and importance, the measure will probably be forced on the attention of the Legislature in the course of the approaching session.

## STATE OF FRENCH AGRICULTURE.

*(From the Morning Chronicle.)*

M. Duchatel opened the Sessions of the Council of Agriculture, and of the General Councils of Manufactures and Commerce, on Tuesday last, in a speech which affords some indication of the progress of opinion in France, in favour of the abolition of all unnecessary commercial restrictions. The agricultural interests of France, like those of our own country, are suffering from one of the causes which are most conducive to the prosperity of the manufacturing classes, namely, the abundance and consequent low prices of every kind of grain. The Minister candidly told the Council that he could do nothing with a view to relieve them from this state of things. It was not in the power of Legislation to propose a remedy for it. He stated at the same time, that amidst this general depression in the prices of produce, agricultural improvements were making the most rapid strides throughout the kingdom. New methods of cultivation were every day devised; new implements were invented; and the growth of sugar from beet-root was becoming so extensive and so perfect as to enter into competition with the sugar of the tropical countries.

RENTS.—TO THE EDITOR OF THE GLOBE.—Edinburgh, Jan. 16, 1836.—SIR,—Your valuable paper has brought forward much on the distressed state of the agriculturists. The subject is no ways difficult in my apprehension. It simply resolves into the fact that rents are too high. I am decidedly of opinion that landlords are in no way to blame for that—the fault lies entirely with the tenants. Whenever a farm in this country falls out of lease, there are always a variety of offers for the new lease. The landlord generally selects the highest offer who is possessed of capital sufficient to stock the farm properly, and who also must find security for payment of the first year's rent. Surely a tenant who can do so should be best judge as to the rent he should pay. He is possessed of considerable capital, which he must deprive himself of if he gives too high a rent. I think I have plainly established that the tenants, and not the landlords, are the cause of the rents being higher than they probably ought to be. You would render a service I think to the public, if you would put this view of the case into the hands of some person who would prepare something for the public; it might be of use—it would relieve the landlords of a great share of the blame which is laid on them by persons who do not reflect on the subject.—I am, Sir, your most obedient servant,—A FRIEND TO JUSTICE, AND NOT A LANDED PROPRIETOR.

## TURF INTELLIGENCE.

No person possessing the smallest particle of that soft medullary-like substance, called brain, will deny that, to the emulation of the turf, we are mainly indebted for a breed of horses far superior to whatever before appeared upon the surface of the earth; and that in a general national view the turf establishment is second to no other institution. We have through life experienced the utmost delight from watching its operations; like other sublunary concerns, where opposing interests come in contact, it is liable to abuse; but, as we are very well aware that false accusations have been frequently brought against it, we have always come forward with alacrity in its defence on occasions similar to the late attempt of the Grizzly Muff of the London press, and his attendant Mocking Bird, when these Screech Owls endeavoured to excite an alarm by the clumsily-fabricated report of a rascally offer made to Mr. Mostyn in regard to his filly, Queen of Trumps. However animated by the same feeling which induces us to expose the machinations of ignorant literary mountebanks, we equally extend our unqualified reprehension to all dishonorable attempts in turf affairs which come within our reach. It is with heartfelt regret we place before our readers, the following statement of one of the basest transactions which ever disgraced the turf. It requires no comment, at least on the present occasion—it speaks very plainly for itself—deliberately-concocted fraud breathes throughout:—

### THE DELICATE INVESTIGATION IN IRELAND.

“TURF CLUB, DUBLIN; 9, UPPER RUTLAND-ST., 5th Dec. 1835.—At a meeting of the Turf Club, held at this house, this day—present, Lord Howth, Colonel Westeura, Colonel Armstrong, Hon. Captain Vaughan, Mr. Gustavus Hume, Mr. Casey, Mr. Purcell, Mr. Pottinger, Mr. Rutledge, Mr. G. Knox, Mr. Osborne, Mr. V. Blake, and Captain De Montmorency—it was moved that Colonel Westeura and Lord Howth resume their office as stewards, when, in consequence of the unavoidable absence of Mr. Maher, it was moved by them that Colonel Armstrong be appointed to fill his office.

“The following resolution was then passed:—Resolved, That taking into consideration the question that has been raised, and the public proceedings which have taken place, respecting the identity and ages of Caroline and Leinster, both the property of Mr. Edward Ruthven, a member of the Turf Club, the Stewards are bound, in justice to him, and in vindication of the character of the Club, to require Mr. Ruthven to produce before them both Leinster and Caroline, at such time and place as may be most convenient for all parties, to be fixed on by the Stewards of the Turf Club; and we beg to call on the Stewards to carry this resolution into effect.

G. W. Vaughan  
W. Casey  
Gustavus Hume  
Peter Purcell  
H. De Montmorency

Thomas Pottinger  
J. Osborne  
D. W. Rutledge  
George Knox  
Val. O'C. Blake

“On this resolution being presented to the Stewards, they directed Mr. Hunter to write to Mr. Ruthven officially their approval of the above, and to require his compliance with the same, as per annexed letter:—

“9, Upper Rutland-street, 5th Dec. 1835.

“SIR,—I am directed by the Stewards of the Turf Club to inform you, that objections having been made to them by Lord Miltown, Mr. Hendrick, Mr. J. Kelly, and Mr. Henchy, as to the ages and identity of Leinster and Caroline for the Sligos, Pagets Sweepstakes on Tuesday, and match, Fusileer v. Caroline, for all which races your horses came in first in the last October Meeting, they deem it necessary to inform you, that they will enter into an investigation of those cases on Monday, the 28th of December, at 12 o'clock, at the Turf Club House, Kildare; and in pursuance of the foregoing resolution, unanimously agreed to at a meeting of the members of the Turf Club, held here this day, they call upon you to produce Caroline and Leinster on the above-named day, at the time and place already specified, when the Stewards will be in attendance to give their final decision on the races in dispute. I am further directed to request you will, without loss of time, send me an immediate answer to this communication. I have the honour to be, Sir, your most obedient servant,  
J. R. HUNTER, Sec.

“Edward Ruthven, Esq., M.P.”

The inquiry into the identity of Caroline and Leinster, which has excited so much interest in the sporting circles in this and the sister country, was resumed on Monday last, before the Stewards, Earl Howth, the Hon. Colonel Westeura, and John Maher, Esq., and the following well known members of the Irish turf:—Hon. Captain Vaughan, Colonel Armstrong, Captain Hume; Messrs. J. W. Digby, Hendrick, Robert Brown, A. Mansfield, Watts, Pottinger, O'Connor, Henchy, P. Purcell, J. R. Hunter, H. Hendrick, Disney, Hutchins, R. Holmes, R. Hunter, &c. It will be recollected that the last meeting of the stewards closed with a resolution of the arbitrators, that, in order to bring the question of identity to a conclusion, it was necessary that Mr. Ruthven should produce the horses described by him to be Caroline and Leinster, in order that they might be seen by the English witnesses, Lord Miltown having stated that he could not bring his case to a close unless this was done. A notice of this resolution was given to Mr. Ruthven, who declined to obey it. Having introduced the matter so as to enable our readers to connect the previous proceedings with those about to be detailed, we shall shorten the account by stating that after Lord Miltown, Mr. Hendrick, and Mr. Kelly (the parties opposed to Mr. Ruthven in the investigation), had declared their willingness to abide by the decision of the Stewards, Mr. Ruthven's letter was read, withdrawing himself from the Club, and certificates of character for the English witnesses were produced. No one appearing for Mr. Ruthven, and the stewards having in consequence decided on treating it as a *prima facie* case, Lord Miltown called Mr. Walker, a veterinary surgeon, who proved that he examined the filly called Caroline, at the last meeting at Naas; that she had an old three-year-old mouth, with six teeth full shot out, and that the boy who brought her said, she had won a good deal of money in England. This witness also spoke to Mr. Ruthven's extraordinary politeness to him previous to his looking at the mare. This evidence was partly corroborated by Mr. George Watts, and a Mr. Green

was in attendance to speak to the same point, but was not called.

Earl Miltown then stated that, on Mr. Walker declaring his belief that the filly (which beat with such great ease his colt, one he had reason to think a good one) had a three-year-old mouth, with regret he (Lord Miltown) had to suppose that there must be some fraud. His lordship wrote to Mr. Charles Greville, at Newmarket, to know if a filly, answering the description of Caroline, had been sold there lately, and received a reply. His lordship proceeded to read the following:—

“Newmarket, Oct. 26, 1835.

“DEAR MILTOWN—I think it is possible I may have discovered what you want. Becassine, three years old, was bought by Osbaldeston, of Payne, at the end of July: he told Payne he had purchased her for a friend; she was sent to Manchester the end of July or beginning of August, whence it is probable she went to Liverpool, and was shipped for Ireland; in many particulars she exactly answers your description; she is chestnut, slight, bloodlike, with white down her face, stily on the fore legs, frequently in season, but she is light, and not “rather a dark chestnut.” With respect to lop ears, there is great difference in the statements, some asserting, and some denying, that she has lop ears; however, the animal may be easily identified if it be Becassine, as she has a black spot upon one of her quarters; has one white heel behind, and some white above the girthing place, besides white hairs on many parts of her body. If the filly should bear these marks, if you choose to send over here you can easily procure some one to identify Becassine.

“Very truly yours,

“C. GREVILLE.”

“Newmarket, Oct. 27, 1835.

“DEAR MILTOWN—I think it right to add to my letter of yesterday, that Becassine is pinioned at the elbows and turns out her toes, one of the points you mentioned, and there seems to be a doubt whether I stated correctly that she has a white heel behind. Sir Sir M. Wood says she has none—Sir Francis told me that she has; but the marks I have told you of will easily prove the identity of the mare. I am going to town on Saturday.

“Your’s very truly,

“C. GREVILLE.

“I understand the mare was purchased by Osbaldeston the end of July or beginning of August, and delivered at Manchester; what became of her after no-body here knows.”

“Suby Hall, Welford, Nov. 8.

“DEAR MILTOWN—I received a letter from Greville this morning requesting me to send you an account of the sale of Becassine. I bought her of Sir Mark Wood, during the last July meeting, and after she had been some little time in my possession, Osbaldeston wrote to me in London, asking me whether I would sell her, and what I would take for her. I replied 250*l.*, which he agreed to give, and appointed a day and hour to pay me for her. When he gave me his cheque for the money, he told me “the mare was for a friend, and requested me to write to Cooper, at Newmarket, to desire him to get a man to take Becassine to the Railway Hotel at Manchester, where a person would meet him, pay him his expenses in coming from Newmarket, and take the mare from him.” I dare say Cooper has this very little letter by him. The fact is, as soon as I had got my price for the mare I paid no attention to what was said, and whether Osbaldeston told me the name of the person for whom he had bought the mare or not I cannot remember; my impression is that he did, but as I could not swear to it, it is, perhaps, better to say nothing. I also think the name of the man to whom she was to be delivered at Manchester was mentioned, but Cooper, or the man who took her, could tell you this. I fancy it was Jones, but, as I have before stated, it was a matter of no consequence to me, and I paid no attention to it further than writing what Osbaldeston told me, to Cooper.

“Your’s very truly,

“GEORGE PAYNE.

“I ought to have added that the mare was sent to Manchester, and there met by some one, and delivered to him.”

Earl Miltown read the following extract of a letter from Mr. Tattersall, of London, without any communication with him—as also one enclosing an extract from a letter of a Mr. Lucas, of Liverpool—

Extract of a letter from Mr. Tattersall, dated London, 30th November:—

“Being anxious to assist your Lordship, if in my power, to detect the rascally business, if true, about Becassine, I see by yesterday’s Bell’s Life Mr. Osbaldeston says, “that after the mare’s arrival at the town of Manchester, he had a very advantageous offer for her from a dealer who was then shipping other horses for America, and that he closed with him, and that she was on board, and on the point of sailing, &c.” Now, my Lord, there never was an American horse dealer in England; nor, from what I can learn from the American gentlemen who have been over (all of whom I know), that there is such a thing in America, at least one who ever deals in English horses. Mr. Weatherby buys for one or two—I buy for all the others, and insure every horse and mare by its name. If, therefore, either of the gentlemen, four or five of whom were buying at the same time, I should have insured her, as all the insurances are done in London: they will not do one at Liverpool. I will write to Mr. Lucas, the Repository, at Liverpool, to whom all the horses go before they are shipped, to inquire if she ever came to his place, and also to enquire if such a mare was ever shipped from Liverpool. There is a very gentlemanly man at Liverpool, the American Consul, F. B. Ogden, Esq., who if your Lordship makes use of my name, will give you every information; he can, perhaps, tell you more than Lucas, as all Americans go to him.

Extract of a letter from Robert Lucas, of Liverpool, dated Dec. 4, addressed to Mr. Tattersall:

“I am in receipt of yours of the 1st, and have since been making all the inquiries in my power on the subject. I have also showed your letter to Mr. Ogden and Mr. Corben. We are all perfectly satisfied no American horse-dealer has been over from America this year buying horses; indeed it is a question whether there ever was one calling himself a dealer, over from America for the purpose. Secondly, we are almost positive no thorough-bred horses have been shipped the last six months, but what some of us are aware of.”

Several witnesses were then examined when the case being closed, Mr. Hunter, the Secretary to the Club, read the decision of the Stewards, which was as follows:—

“Having most carefully examined the evidence produced before us, we are of opinion, that in reference to ‘Leinster’ and Old Bill, as also to ‘Caroline’ and Becassine, a case of identity has been proved, and we consider Mr. Ruthven’s refusal to produce those horses for examination here as conclusive of the facts of substitution alleged against him.

“We are, therefore, of opinion that neither Caroline nor Leinster are entitled to any stakes in the races for which they may have come in first; that the second horses in those races should be deemed the winners; that the bets should go accordingly, except in the match between Caroline and Fusileer, in which the bets are off.”

“In conclusion, we feel imperatively called upon to remark, that in consequence of Mr. Ruthven’s withdrawal of his name from the Turf Club, it does not become a part of our painful duty to recommend to the Club any further proceedings in this matter.

(Signed) “JOHN C. WESTENRA,  
JOHN MAHER,  
HOWTH.

“Stewards of the Turf Club.”

## THE PLATE.

The Heifer which forms the subject of Plate was a Free-Martin of the Durham breed, bred by the Marquis of EXETER. She was exhibited at the late Smithfield Show as Extra Stock,—obtained a Silver Medal, and was universally admired for her almost perfect symmetry. She attracted more than usual attention in consequence of a Match for £10 having been made between the Noble Marquis and Earl SPENCER, who also had a Free-Martin Heifer of the same breed, bred by himself, the comparative merits of which were to be decided by the Judges at the Smithfield Show. Both the animals were white, and when examined apart from each other, seemed so nearly equal, that it appeared difficult to decide which would be the winner. The Marquis's Heifer was Three Years and Three Months old, and Earl Spencer's Three Years and Six Months. Six stone were allowed by his Lordship to the Marquis on account of the difference of age. Although Earl Spencer's Heifer possessed vast merit, nevertheless upon close investigation and examining them side by side, the superiority of the Marquis's animal was very manifest, and she accordingly won the Match. The well-known character of both their Lordships as eminent breeders, added to the similarity in the appearance of the animals, gave to this Match an unusual degree of interest. The dead weights were given in the Farmer's Magazine for January last, but there was an error in the account of Earl Spencer's. It should have been 140 st. 2 lb., instead of 130 st. 2 lb.

### THE NECESSITY OF POOR LAWS FOR IRELAND FOUNDED ON THE REPORT OF THE IRISH POOR LAW COMMISSIONERS.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

"When we go to beg at a gentleman's house, it is always the wife that asks relief, and the answer is frequently 'go from the door, woman! What do you want here? Why do you annoy us in this manner?' The farmers are kinder by far, it is the humblesort that live on the road-side that are really good to us; but half the gentry, God help them! have no Christianity in them at all."—Taken from the Evidence received by the Irish Poor Law Commissioners.

SIR,—In a former letter I endeavoured to show the direct interest which the English owners and occupiers of land had to obtain Poor Laws for Ireland, and I now purpose to make a few observations on that subject, which have occurred to me from reading several extracts from the report of the Irish Poor Law Commissioners.

To talk of the *poverty* or *distress*—being relative terms—of the Irish peasantry would only be an insult to their sufferings; there is only one term applicable to their state, and that is destitution—destitution the most awful and destructive that can be imagined.

Tell me not of the tyranny of the Emperor of Russia or the poverty of the Siberian Serf as illustrative of abused power and human deprivation; these are indeed instances of mercy and of plenty when compared with the oppression exercised by the Irish landowners and the wretchedness of the Irish poor.

I have, I confess, up to the present time always entertained—to a considerable extent—the ob-

jection so often advanced in opposition to Poor Laws for Ireland—that is to say, the abuses which have crept into the English Poor Laws since the institution of those laws in the reign of Elizabeth and the consequent destruction of the spirit of independence and industry brought about by these perversions, and thus rendering necessary a complete *reversion*—I ought, perhaps, to say *revolution*—of recent principles in relief of the poor—at the risk of more danger and discontent—than would be likely to arise from the real distress of the pauper inhabitants of any county where a legal provision for the poor had never gained a footing. This objection and vein of argument has heretofore been the Goliath of the Irish landlords, but I do hope and trust,—and which is far better I believe, too,—that the report of the Irish Poor Law Commissioners will be as fatal,—not only to the above argument against Poor Laws for Ireland,—but as fatal to all other arguments that can be adduced by the ingenuity of interested men—as the stone and sling of Israel's Bard were fatal to the giant who defied the favoured people of our Maker. In England, we read constantly of the horrid crimes committed in Ireland, and wonder at the depravity of human nature—and thus we are imperceptibly led to the impression that it is the very *nature* of an Irishman to be cruel and vindictive—in fact, we think that he can commit deeds as a sort of pastime to himself, at which our *feelings* happily revolt. We feel, that although the catalogue of crime committed in England now and then affords an instance of diabolical wickedness, still it is quite obvious to our minds that these few instances sink into a shadow when compared to the "bloody men and guilty deeds" of Ireland—and thus we erroneously conclude that they are beings of a different caste from ourselves. But here we overlook the real truth. We all know that the sleek and well-fed mastiff—the favourite

of a rich master and the delight of the cook—generous of her employer's viands—would be much less disposed to commit *larceny* at a butcher's shop than the gaunt and half-starved cur, (whose allegiance to a poverty-stricken razor-grinder is accepted only on the terms that he boards himself) would be disposed to commit *felony* by killing a sheep—and yet we forget or neglect to acquaint ourselves of the ten-fold provocation to crime the Irish poor at this moment endure. Oh no! it is not their nature to be worse than ourselves—by nature they are open-hearted and generous, but by oppression and cruelty they are rendered—*what they are*.

It is true I had some notion of the misery of these poor people from various narratives I have at different times obtained from them when I have by chance employed some of them during the harvest, or when I have happened to meet with them on the roads. But, in order to show that I had formed no idea of the *real extent* of their wretchedness arising from oppression and want, I will here give as nearly as I can, in their own words, a statement I had from two Irish families who harvested for me in 1831; and then I will compare this history of themselves, with the history of some others contained in the report of the Irish Poor Law Commissioners, and also in the Clonagath meeting, and which will leave no doubt in the mind of any reasonable person, but that the families I shall first speak of, although their mode of gaining a subsistence was wandering and precarious, still they were, compared with those spoken of in the documents to which I have before alluded, well off. These families—I mean those who harvested for me in 1831—consisted collectively of two men, two women, and about five or six children; the men and women were all strong and healthy, because—as *they said*—they live well. They were natives of the county of Clare, where they each had a cabin and potato-garden of nearly an acre in extent, and the rent they each paid was 5*l.* per annum. These gardens my informants told me they managed to plant during the March month and the first fortnight in April. This grand object of planting being accomplished their attention was immediately turned to crossing over to England, leaving the care of their gardens and cabins to some old relative or friend, and this trust they told me was always faithfully fulfilled. When they arrived in England they immediately set about begging their way to the market-gardens round London, which gardens afforded them employ until the forward haying season commenced in that part of the world; and when this means of employment ceased round London, they usually got off to the adjoining counties, where they generally found the haying lasted till the commencement of harvest, when, of course, they could obtain plenty of work at high wages. Immediately the harvest was concluded they set off to a hop-growing county, where they joined the hop-pickers, and next, as a finish to their round, travelled back to the London market-gardens to help to get up potatoes, where they remained as long as employment was to be found, and when no work was to be had, begged their way again to some port for the purpose of getting back to Ireland to pay their rent from their former savings, to subsist on their potatoes during the winter, and to live in hopes of again crossing the Channel in the spring. Well, surely one would think this was all hard enough and quite sufficient difficulties and hardships for human nature to bear up against. I know I thought so, and I

wondered at the quiet contentment of these poor souls when they assured me they were *quite entirely well to do*, and wished I could see the situation of some of their poorer countrymen. I confess I doubted that such existed, but I am sorry to say that those doubts no longer remain in my mind, and the assertion, of my Irish labourers, that if I could see the state of some of their afflicted neighbours *I should think them bad off quite entirely*, is confirmed by the following authenticated facts:—At the Clonagath Meeting, the Rev. Mr. Phelan, in speaking of the horrors occasioned by “driving estates,” proceeded as follows:—“On one of these instances, where the old occupiers were dispossessed, an adjoining farmer allowed one of the ejected families to construct a temporary hut on his ground until Providence should enable the afflicted family to procure some other residence. Soon after the agent of the landlord, both of the farmer and the ejected poor man was passing by, and, seeing the hut, and learning the use it was made for, he rebuked the farmer very sharply, and asked how he dare allow such a thing to be done. The farmer, with more humanity than prudence, replied ‘Where will the poor people go? sure they must go somewhere.’ ‘Sir,’ said the agent, ‘you should not allow the land to be disfigured.’ ‘Then,’ said the farmer, ‘how can they live, or where will they go?’ The agent replied, ‘what the devil do I care! *can't they eat each other?*’”

Mr. Phelan proceeds—“Allow me to request your particular attention and the attention of the gentlemen of the press, some of whom I see present, while I state facts over which humanity must shed a tear—facts that prove stronger than any language—the absolute, urgent, and immediate necessity of Poor Laws—facts that have united men in calling for a poor-rate whom no other argument would convince as to the expediency of that measure—facts, I repeat, which appeal to the heart of every humane man in England and Ireland for sympathy and redress. In this one parish in which I now speak there have been ejected within the last few years by three or four landlords 178 families, amounting to 992 individuals, including 224 widows and orphans. If I am asked what has become of those people that have been ejected, I answer that a considerable number, particularly of the aged and infirm, lived but for a very short time—the shock they received when driven from the spot that gave them birth—the destitution into which they were plunged soon terminated their sufferings; others, after enduring every species of wretchedness and privation, sank at length beneath the weight of their afflictions into a premature grave; others again sought a refuge in the adjoining villages, where they soon increased the burden of the humane and charitable; many took shelter among their friends and relations in the neighbourhood. I am aware of many instances in this parish where there are families lying and rising in one miserable apartment only of a few square feet. My professional duties enable me to say that the mortality which prevailed among the unfortunate people, and the privations they had to endure were truly deplorable—”

I take the following from evidence received by the Irish Poor Law Commissioners: Widow Kilbohy, in the county of Mayo, says—“My husband, who was a labourer, has been dead for ten years; he left four young children without any means of support but my industry. He once dealt in buying oats to sell again when he had dressed them into meal. This gave me some skill

in the business, which has been of use to me since, persons engaged in that business employing me to tend oats in the process of kiln-drying. I am obliged for this purpose to watch it without intermission for twenty-four hours; remaining up during the whole night, and am paid from 7d to 1d for each kiln-cast, according as the business may be pressing or slack. The most I could attend to is four kiln-casts in the week, and on the average of the whole year I may be employed nine months. When I get constant employment I sleep as opportunity offers between the taking off of one cast and the putting on of another. I have been three weeks without lying on a bed, not sleeping but as I took a start of sleep in the kiln at such times as I have mentioned: and this at the wages as I have stated, at most 2s 6d per week. Since my children have grown up (the eldest is now fourteen) they have given me some relief by helping me, but we receive no additional payment. I never lay in a stock of potatoes, but buy from week to week as I earn the price of them. In summer potatoes are dearer than any other season of the year, and I have then less employment. Of course I am more distressed than at any other time of the year; still neither I or any of my family have ever begged, though I am sure most of the beggars live better than we do. However little I earn we endeavour to live on it. Sometimes when I was earning nothing persons who are in the habit of employing me have lent me money to be repaid in work when they would have employment for me. At such times we have lived on much less food than usual. *We have often lived on one meal of dry potatoes in the day.* I and my four children have often lived on eight stone of potatoes for a whole week—about sixteen stone would be sufficient for us.—(Mr. Loftus says they have been accustomed to live on so much, and be content with it, but if they could afford it they would consume twenty-four stone.)—We very seldom at any time of the year have milk with our potatoes; we sometimes have a salt herring, but we eat them three times dry for once that we have any thing with them; and it is not the best even of potatoes that we have—*we buy the cheapest and worst sort of lumpers that we may have them plentiful.* *I am not able to clothe my children, and I have never been able to send them to school.* A family had been attacked by fever; the commissioner found the father and four out of five children sick, and altogether on one bed of *moist rotten straw*, and their only covering a single fold of what is called a poverty-blanket. Their only attendant was the fifth child, a girl of eleven years old. No person would come into the house. Their neighbours used to leave some potatoes within a few yards of the door: *this was their only support—medical attendance was quite out of the question.* Another instance follows—Molowney says that in the mountains of this parish when the potatoes fail *they bleed the cattle and eat the blood.* Patrick Byrne says—“My first take was 23s per acre, and when my lease was out my landlord raised the rent to 45s 6d. As I was loathe to leave the place I was born and reared in, I strove to keep the roof over my poor mother's head; however, with all our industry and hard work, what was not in the land could not be taken out of it; we could not pay the rent, so of course we were put out. The old woman went to the landlord and told him he got all the produce that came off the land; and he knew very well he got the very corn after it was cut, drawn away by his own carts and horses; that the cows we reared went

to pay the rent; all would not do! and the only answer she got was that the ground was his, and the money hers, and as she could not pay the rent he fixed on it, she could go somewhere else. She is now seventy years of age, and it is hard to see her depending on me when I can rarely get employed!”

Now does not humanity shudder at such statements as the above? and do they not carry conviction to the mind of every reflecting person of the necessity for a legal protection (or, in other words, a legal provision, of a sufficient portion of the necessaries of life) for these poor oppressed and suffering wretches? John Locke, in his treatise of Civil Government, truly observes, “that he who makes an attempt to enslave me thereby puts himself into a state of war with me:” and again he says,—“whenever violence is used, and injury done, though by hands appointed to administer justice, it is still violence and injury however coloured with the name, pretences, or form of law, the end whereof being to protect and redress the innocent by an unbiassed application of it to all who are under it; wherever that is not *bona fide* done *war is made upon the sufferers*, who having no appeal on earth to right them, they are left to the only remedy in such cases—an appeal to Heaven.”

These just sentiments of Locke's strictly apply to the present situation of the Irish Aristocracy in respect to the present state of thousands of the Irish paupers. Is not violence and injury done to these poor creatures by hands appointed to administer justice? and thus is war declared by the rich against their destitute brethren: for if it be not violence to drive human beings in a complete state of destitution from house and home to starve in a ditch—I say if *this be not violence*, I readily confess I am ignorant of the meaning of the term. The agent tells the farmer the estate must not be disfigured. What are the poor creatures to do? asks the humane farmer; and for this one question the good man secured to himself our blessed Saviour's promise to the giver of a cup cold water. What remedy does the Bellial heart the agent suggest? Why, for the poor souls to eat each other. *Truly this is giving hungry people but a dangerous propensity!* Cannibals, I have no doubt, like other carnivorous feeders, prefer the *fat and well-fed* to the *half-starved and lean*, and consequently, by adopting the advice of the steward—when these wretched mortals had become epicures at man-eating—although, perhaps, they might be satisfied with a dinner from off one of their own associates during the week-days, still they would at least have a desire either for a Lord or a Duke as a Sunday's repast, and in the end perhaps their appetites would even aspire to the Lord-Lieutenant himself as a Christmas meal. Mr. O'Connell—I am glad that name is written, for I had a hard task to give him so respectful a cognomen—has promised to bring forth a measure of Poor Laws for Ireland during the present session. I sincerely hope he will redeem this promise; but, if he should be found wanting, surely the government cannot allow the session to pass over without securing some remedy for the present monstrous evil; for if the report of the Irish Poor Law Commissioners be read by one-twentieth part of the community, no government, I am convinced, would be able to resist the strong feeling that would thus be created in favour of the measure.

Above all, I trust the report will be read by our kind-hearted Sovereign, for he has expressed himself interested for the condition of the labouring

classes of Sussex, and has liberally subscribed to several societies in this county established for rewarding meritorious labourers, and consequently it is only reasonable to conclude that his Majesty's sympathy would graciously extend—in such an increased degree as the nature of the circumstances require—to his starving and degraded Irish subjects. To such of your readers as have not seen more of the report of the Irish Poor Law Commissioners than the above passages which I have copied off—and the report abounds in like instances of distress—it will be some matter of surprise to learn that on the whole the commissioners seem *opposed* to the introduction of Poor Laws into Ireland. They talk of the moral degradation which might follow in the train of measures benevolently intended, but ill-judged, when applied to a nation possessing the habits and being in the peculiar situation of the people of Ireland. They also speak “of further investigating the causes of destitution which have come under their notice. What occasion there can be for this investigation I am at a loss to imagine, for they (the Commissioners) have themselves in their own document fully shown the causes of destitution, viz., *the low wages of labour and the exorbitant rent of land; and there are the natural effects of the political anomaly of having a legal provision for the poor in one part of the United Kingdom only.*—I am Sir, your obedient and very humble servant,  
AGRICULTUR.

Sussex, Feb. 3, 1836.

No. XV.

#### TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—An opinion prevails very generally amongst all classes that little more is necessary for the cure of agricultural distress, than a reduction of rents; and it has been maintained in public and in private, that as the landowners are a small body of men, their interests ought not to stand in competition with those of the great majority of the people; in other words that it is expedient and reasonable, to sacrifice them for the public good. On this last point I shall only observe, at present, that any argument tending to prove this, must apply equally to the fundholder.

I will now attempt to shew, that a reduction of rents. (however necessary and unavoidable,) cannot restore prosperity to agriculture, nor, (with present prices, prevent large tracts of land from going out of cultivation with the ruin of tens of thousands of landlords and farmers, and hundreds of thousands of labourers, and others dependent on such lands. If high rents were the only grievance, the universal adoption of corn-rents would remove it entirely; but the evil is much more deeply seated and inveterate, for nothing can enable the British cultivator to support the direct, and indirect taxation peculiar to England, with the prices of the continent. The ruin and removal of the present occupiers, with the transfer of the soil of England to the mortgagees, will not alter the case at all, so long as the public debt and taxes, and the prices remain as at present. The reasoning of Mr. Huskisson still applies to the state of this country, (debate on the Corn-Laws, May 24, 1814.) “The noble lord, (Lord A. Hamilton,) deceived himself if he imagined that we could return to the state in which we were before we entered on the contest. This was one of the most dangerous

errors that could be entertained. The whole expenditure of the country at that time, only amounted to 16 millions. He (Mr. H.) was confident that our peace establishment must entail on us a permanent charge of nearer sixty, than fifty millions. And would this produce no alteration in the money value of articles? When gentlemen talked of the increased price of bread, did they forget that every thing else had risen in proportion, and that, not in consequence of the *high price of bread, but the amount of taxation*. It had been said that the obvious remedy was for the landlords to lower their rents. If even the whole rental of the country were remitted, it would be impossible for the country to return to the prices before the war.” (Speeches of the Right Hon. W. Huskisson, pages 299 and 300.) I assert without fear of refutation, that our agriculture cannot go on *with continental prices, and the present amount of public debt and taxes*; and were the whole rental of the kingdom remitted, it would not affect the general question, nor lower the price of bread to the consumer. It would have no other effect, as Mr. Malthus has observed, than to enable those farmers whose lands now pay a rent to live like gentlemen, and *they would have to expend that portion of the general revenue which now falls to the share of the landlord.*” (Ricardo,—essay on the Profits of Stock, page 20) “Is it credible that if the price of corn were to gradually fall to 45s or 50s a quarter, it would answer to us to go on improving our agriculture with our increasing population, or even to maintain our produce in our actual state? It is a great mistake to suppose that the effects of a fall in the price of corn on cultivation, may be fully compensated by a *diminution of rents*. Rich land which yields a large neat rent, may, indeed, be kept in its actual state, notwithstanding a fall in the price of its produce; as a diminution may be made to compensate for its fall, and all the additional expenses that belong to such a rich and highly taxed country. But in poor land the *fund of rent* will often be found quite insufficient for this purpose. There is a good deal of land in this country of such a quality that the expenses of its cultivation, together with the outgoings of poor rates, tithes, and taxes, will not allow the farmer to pay more than a fifth or sixth of the value of the whole produce in the shape of rent. If we were to suppose prices of grain to fall from 75s to 50s a quarter, (or at this time from 60s to 40s) the whole of such rent would be absorbed, even if the price of the whole produce of the farm did not fall in proportion to the price of grain, and making some allowance for a fall in the price of labour. The regular cultivation of such land for grain, would be given up, and any sort of pasture, however scanty, would be more beneficial both to the landlord and farmer. Every diminution of price (of produce) not fully and immediately balanced, by a proportionate fall in all the necessary expenses of a farm, will tell in the computation; and if after all these outgoings are allowed for, the price of produce will not leave a fair remuneration for the capital employed, according to the general rate of profits, no sufficient motive can exist to continue the cultivation of such land.” (Malthus. Observations on the Corn Laws, and a Rise and Fall in the price of Corn on Agriculture, pages 18, 19, and 20.) I cannot think that a great fall in the price of corn can be “fully,” much less “immediately balanced by a proportionate fall in all the necessary expenses of a farm.” That there has been yet no proportionate fall in the

wages of the labourers is well known, and it is made a subject of rejoicing, by the advocates for low priced corn, and amongst them by Earl Fitzwilliam, who flatters himself and tries to persuade the landowners, that rent will fall but little under low prices of corn. But if the aggregate money amount of a farm's produce is to fall permanently, (one-third suppose,) and the landlord and labourer are to receive still the same, or nearly the same, amount in money, it is evident they will receive more than their share of the produce;—this may be to them a subject of rejoicing, but not to the unfortunate occupier, whose capital must be taken away by it; and I admire not that obliquity of moral feeling which can rejoice at the robbing of Peter to pay Paul. When I consider the effect of more prosperous times on the habits of the English labourers, and how many of the articles now necessary to them are little influenced by the fall of corn, either because they are affected by taxation, or consist wholly or in part, of foreign materials, I expect no adequate reduction of wages so long as employment is found. From Sir F. M. Eden's work on the Poor Laws I find that in a labourer's family of about an average size, the articles of house-rent, fuel, soap, candles, tea, sugar, and clothing, are generally equal to the articles of bread or meal; on a very rough estimate the whole may be divided into five parts; of which two consist of meal or bread, two of the articles above mentioned, and one of meat, milk, butter, cheese and potatoes. These divisions are of course subject to considerable variations, arising from the number of the family, and the amount of the earnings. But if they merely approximate towards the truth, a rise in the price of corn (and consequently a fall,) must be both slow and partial in its effects upon labour. Meal, milk, butter, cheese, and potatoes, are slowly affected by the price of corn; house-rent, bricks, stones, timber, fuel, soap, candles, and clothing, still more slowly; and as far as some of them depend in part, or in the whole, upon foreign materials, (or are objects of taxation) as is the case with leather, linen, cotton, soap, and candles, they may be considered as independent of it; like the two remaining articles of tea and sugar, which are by no means unimportant in their amount. It is manifest, therefore, that the whole of the wages of labour can never rise or fall in proportion to the variations in the price of grain; and that the effect produced by these variations must be very slow in its operation." (Malthus, as above, page 6.) "It is, undoubtedly true, that corn might be just as successfully cultivated, and as much capital might be laid out upon the land at the price of 20s. per quarter, as at the price of 100s., provided that every commodity, both at home and abroad, were precisely proportioned to the reduced scale. But to infer from these truths that any natural or artificial causes, which should raise or lower the value, of corn or silver, (or of gold, our present standard,) might be considered as matters of indifference, would be an error of serious magnitude. Practically, no material change can take place in the value of either without producing both lasting and temporary effects, which have a most powerful effect on the distribution of property." (Malthus, as above, page 13.) If, then, a fall in the price of corn can only operate slowly and disproportionately on the wages of the labourer, it must do so on those of the artisan, and on the articles supplied by him, many of which are probably raised by taxation. On general and local taxes,

"on taxes on farming stock," "on taxes on the necessaries of farmers," a fall in the price of corn will have but little influence; therefore, if corn continue low, it will very seriously affect the condition of the farmer, whose trade has always, (on a long average) been, comparatively, a very poor one. As I cannot agree with you, Mr. Editor, in thinking any reduction whatever, of rent or tithes, (however necessary) can alone effect a cure for agricultural distress, neither can I think with you, that abundant crops have caused such low prices, (except partially so of wheat) because the crops of barley, oats, beans, and peas, have been deficient for several years; yet even of these the prices are low, considered as the prices of scarcity. Besides most products of British industry (unless the objects of direct taxation) are equally low, and have been progressively falling in price, *pari passu* with corn, ever since the passing of Peel's bill, and more especially, since the completion of that measure by the final withdrawal of the one pound notes. The whole circulation of England has been reduced nearly one half, and that of the *rural districts*, *two thirds*; this seems sufficient to account for the fall of corn, and all commodities; but if any one doubt, let him compare the aggregate amount of Bank of England issues, and of country bank notes, with the prices of corn, making allowance for years of dearth, or of abundance; and also the variations in the prices of other commodities, allowing for remission of duties, or other accidental causes, from the year 1815 to the present time, and all doubt will cease.

To talk of restoring prosperity to agriculture by any reduction of rents and tithes *alone*, is to support delusion, and to deceive the people of England, and particularly the farmers, to their ruin. Let taxes, as well as rents and tithes, be brought down to the price of corn, or if the present amount of taxation is to be kept up, let it be paid in a currency of the same value as that in which the money was borrowed. There is no alternative but this or ruin for agriculture.

The present state of things ought not to excite surprise, since it was distinctly foretold by those "currency doctors," Mr. Cobbett, Sir John Sinclair, Mr. Attwood, Lord Western, Sir James Graham, and others.

I am, Sir,

Your obedient servant,  
Sussex, February, 1836. TERRÆ FILIUS.

#### TO THE EDITOR OF "THE FARMER'S MAGAZINE."

SIR,—In your valuable publication, I often read letters, essays, and reported speeches, on that much engrossing subject Agricultural Distress, and on the best mode of relieving the cultivators of the soil from their supposed embarrassments.

These articles are frequently couched in very strong language, abusive to the land-owners, and threatening serious consequences to them if they do not so permanently reduce their rents as to restore prosperity to their tenants.

I do not know what good purpose such violent language can answer, for the writers can know very little of human nature, if they suppose that so large a class of persons as the owners of lands are, (both great and small) can be brought to act on any other than the universal principle by which all others are governed, that of making as great advantages of their property as they can; indeed

their arguments can apply to such only as hold land under lease, the tenant at will can quit his farm at a short notice, if he finds it a losing concern, at least as easily as the manufacturer can give up his manufactory, or the merchant his shops.

I am old enough to remember that some 40 or 50 years ago many held their farms on long leases at very low rents, and when afterwards agricultural produce advanced to very high prices, I never heard an instance of a tenant's going to his landlord and saying, "I occupy your land on terms very inadequate to the value of its produce; I know that you cannot now live on your income, and are involving yourself and family in debt, whilst I am filling my pockets, therefore I will make an addition of ten per cent. to the rent." If such was the case in any instance I shall be much obliged to either of your Correspondents if he will point it out; but if such a circumstance never occurred, with what face can tenants, now that things have taken a different turn, ask for abatements. If they insisted on the pounds of flesh when they had it in their powers, have they not set examples to their landlords, which they cannot blame them for following.

Is it quite so clear that farmers are suffering to the extent complained of? We hear of very few bankruptcies or insolvencies amongst them, certainly not more than occur with persons in any other lines of business. The only depressed article of their produce is wheat, and I shall endeavour to shew why that is so low in price.

I have read much on the low prices that wheat has borne for the last few years, where various causes have been assigned for the depression, but I think the true one has not been hit upon, namely the increased and increasing cultivation and use of potatoes.

This root now forms by much the greater part of the food of the poor, is in common use at the dinner tables of the middling classes in lieu of bread, and is also introduced (fried) at the breakfast tables of the rich.

I live in a manufacturing town where a great number of young women are employed; they tell me that few of them allow themselves more than one sixpenny loaf of bread a week, and even that is probably composed in part of potatoes; the whole of their other food, with the exception of tea and an ounce or two of butter, is potatoes.

The large farmers, whose complaints are loudest, although they in general rent their farms cheaper than the small ones, seldom cultivate the root to any extent themselves, (the attention required would interfere too much with their sporting propensities, and enjoyments at markets and fairs), but let their potatoe grounds in small parcels at high rents to inferior persons, who manage them chiefly at their leisure times, the farmers manuring the land, doing the plough labour, and hauling the produce home to the cultivator, or to the persons to whom he disposes it.

This person retains sufficient for the use of his family, and sells the remainder, except the refuse with which, with the aid of a small quantity of barley, he keeps and fattens one or more pigs, according to his means.

I believe it is ascertained that the quantity of wheat grown does not by any means keep pace with the increased population, and yet more is grown than is wanted, which I think I have clearly accounted for. No doubt, the increased quantity imported from Ireland has its effect, but I believe

the chief cause is the growing use of the potatoe as a substitute, and whilst that continues there is but one way of advancing the price of wheat, namely, by reducing the quantity produced to a level with the demand, and employing the lands for other purposes.

The poor man says that 240lbs of potatoes does as much good in his family as 60lbs of wheat; now if we take the average produce of an acre of wheat at 11 cwt, and an acre of potatoes at 130 cwt, which I believe is a statement in favour of the wheat crop, it will appear that one acre of potatoes produces about as much food as three acres of wheat; or in other words that the productive land in the country to the extent of the potatoe cultivation, is equal to a threefold increase.

Under these circumstances what can Parliament do? Can they force the people to relinquish the use of potatoes and fall back on that of wheat? Or is it not sufficiently obvious that the farmers alone can remedy the evil (if an evil it be) by applying their lands to other purposes.

Should these remarks merit your notice, I may perhaps pursue the subject in another epistle.

AUDI ALTERAM PARTEM.

No. XVII.

#### TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—As a constant reader of your valuable publication, I forward a few remarks in answer to "A Subscriber," who through your pages solicits information, on the good arising from agricultural shows of stock, ploughing matches, &c. Having witnessed the establishment and proceedings of one of the first societies in England, induces me to give an opinion on the good arising from such societies, which have in their object the encouragement of good breeding, cultivated by the different modes adopted by different societies; some by offering premiums for breeding stock, others to the produce, regulated by certain restrictions in the different classes, according to the wish of the society; by age and manner of keeping, &c., &c.; which is productive of great good, by bringing together the specimens of the different herds and flocks which are kept in the neighbourhood, where such societies are established, at once pointing out the sort of animal or animals that possess those qualities most worthy of encouragement; then by the award of premiums, you produce a spirit in the breeders of the neighbourhood, who not only compete at the annual meeting, (as a school for the young farmer,) but at the fairs and markets around, will be found that improvement in the breeding and feeding of such animals, that it will at once establish the neighbourhood as famous for good cattle, both in store and fat order. The competition in the different classes of such societies affords much information, even to the more enlightened, by bringing together the breeds of many counties as specimens of their choice, showing the different propensities each breed of animals possess over those of their neighbours, leaving the selection of breed to those who wish to establish themselves as breeders, or supporters of the good that may arise from the attention of the farmer to this great point, but more particularly in the breed of sheep, as they are capable of great improvement in every district, and will repay the breeder instantly. I have seen the astonishing effect of good breeding over that of the careless;—for in-

stance, the one-year old sheep fed upon vegetable food only, have surpassed those of an ill form that have been fed till two years old, and without restriction.

I am of opinion that if the carrot, turnip, and mangel wurzel, be properly cultivated, they will surpass any artificial food that may be introduced, as a system, knowing that cake or corn never gave solidity or good form to an ill-bred animal. Premiums also for the different vegetables grown in the district, would lead to an improvement in their respective qualities, in the advancement of which the ploughman would take an active part, therefore none need more encouragement or example. In this neighbourhood they are amply rewarded, by the exertions of R. W. Baker, Esq., who has been most sanguine in the formation of a ploughing match, held annually at his residence at Cottesmore, since which great spirit has been produced in the hearts of the ploughmen, who are seen daily striving to advance their skill for the next annual meeting, which must undoubtedly profit the farmer. As a proof the rapid improvement made since the commencement, would convince the most prejudiced, and at once agree that the men of Rutland are now equal, if not superior to those of any other county in England.—I fear I have taken too great a liberty with your pages, but being a warm supporter of your valuable publication, must plead the excuse of your friend

Feb. 15, 1836.

RUTLAND.

#### TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—Since my last you have pretty well answered the attack made upon you by the dictators of the *Agriculturist*. Their descending to something very like abuse, and imputations of unworthy motives to you and those connected with the *Mark Lane Express*, upon, I believe, no grounds whatever, but because you as an honest journalist took a common sense and just view of the change in the currency scheme, advanced as a panacea for all the evils that are supposed to afflict the agricultural part of the community, and finding it false, denounced it accordingly, is unworthy of men advancing themselves forward as the advocates of an interest in the kingdom—so, I may almost say, solemn, and so intimately connected with the other great interests, all of which are of equal importance, and unquestionably deserve equal protection, and the most dispassionate consideration for their interests in the investigation of causes, and the adoption of measures for the relief of any other individual branch so supposed to be suffering from inadequate protective laws or regulations. One would have thought that they would have guarded their cause by a more dignified and conciliatory attitude in their assumed advocacy, than that which they have bodied forth in the columns of the "Live and let Live" journal. I may not be a judge in such matters, but their principles, though they may deem them orthodox, seem to me either no principle at all, or, to say the least of them, of a very suspicious character. They taunt you with Whig principles. What a dishonour! To my simple mind it appears tantamount to taunting you with honesty. However, (though I know I need not trouble myself,) heed them not, the snug, well-found ship, *The Mark Lane Express*, if conducted, as I have but little doubt it will, with that ability it has latterly displayed, will long ride under easy canvass among her contemporary barks, long after such crazy suddenly got-up ventures as the *Agriculturist*, are

silently sleeping at the bottom of the literary ocean, and their performances no more remembered.

A Whig Ministry have given the agriculturists a committee upon agricultural distress, but the currency-changing gentry are left alone in their glory. Something like unfortunate beings suspected to be tainted with some contagious malady, there they stand, looked upon by friends and foes alike, as objects only of pity, and dangerous to come into contact with. There will, I have no doubt, be a fair and full inquiry made, and I trust that such parties as those you have very judiciously pointed out in your leader of last Monday, will be called before the committee. I am glad that a committee has been granted, because of the outcry that has been made, and instigated by the rack and war-rent-supporting needy embarrassed landlords, though I think quite unnecessarily, and at a useless expense to the country, because partial distress (and only partial it is, and local, and so it will be found without pretending to the gift of foreknowledge,) is well known and acknowledged, and its extent and locality; and therefore, what remained for the legislature to do, or to be called upon to do, was to consider what might be proper to be done for the removal of that distress as far as possible, without prejudice to any other of the great interests of the state. Had the agriculturists only called upon the ministers and parliament to do this, I shrewdly think they would have gained quite as much, and not unlikely more, and that more speedily than by the course pursued. The inquiry may (and will I trust) be a searching one, and the perusal of the report by the country at large may have a different effect to that anticipated by those who expect to derive great benefit from it.

I know your space for original matter is now more limited on account of the important matters discussed in parliament, I shall therefore make only two or three more remarks. Whatever legislative enactments may be made, supply and demand will govern prices; and the rent of the land must be according to the marketable value of that which it produces. It ought not to be tolerated in this country that the price of corn shall be made to rise, but by the natural demand arising from the industry and healthy prosperity of all classes of the community. Equal justice certainly the farmer ought to have, and that I think he cannot say but he has, when it is called to mind the many taxes from which he has been relieved since the peace, and the enjoyment of so heavy a protective duty upon foreign corn by the present corn laws.

Another circumstance occurs to me at this moment, which may account to a very considerable extent for the great productiveness of our harvests of late years. It appears to me that really very bad harvests cannot now occur so frequently as formerly under our improved husbandry. All kinds of grain are now sown generally three weeks or a month earlier in their respective seasons, and therefore are fit for cutting three weeks or a month earlier, thereby having the advantage of being stacked or housed in the best part of the summer. The extensive drainage too over the whole kingdom, and which is progressing more and more every year, (underdraining being now found to be the ground-work for all improvements, particularly upon arable land,) has tended, and is tending greatly to ameliorate our climate; so that we cannot now, it appears to me, be visited anything like so frequently with bad harvests, and when such do take place they cannot be by many degrees so fatal to the hopes of the farmer.

Many other things rise in my mind, which support me in the conviction that supply alone keeps down

price, and that no tampering with the currency can permanently raise it without raising the price of all other products of the industry of our country in the same proportion; and then, where would be the real benefit to any body, who ought in justice to be benefitted by any legislative enactment?

REFLECTOR.

Strand, Feb. 12, 1836.

## ON THE DEGENERACY OF THE POTATO.

BY MR. WILLIAM PATON, GREENABY, FRED. ISLE OF MAN.

(From the Quarterly Journal of Agriculture.)

Nothing need be said on the value of the potato, and consequently, on the importance of investigating the causes which may either deteriorate its quality or lessen its productiveness.

For some time past there has been much complaint relative to its being infected with a disease called the *taint*, and inquiry has very judiciously been courted concerning the cause of it, and the means by which it may be prevented. Some of the correspondents of this journal have assigned reasons for its existence, which must be admitted to be plausible, and to a certain extent correct; but after making a variety of experiments, and gathering information from different potato growers I have been led to form conclusions respecting the causes of this disease, which do not yet appear to have received the attention which they seem to myself to merit. While most correspondents have noticed the injurious influence of external causes in producing the taint, they seem not to have directed their attention sufficiently to those which are inherent. I believe it will be found that where this disease has been most prevalent, it has affected most seriously those sorts of potatoes which, from their superior quality, have been cultivated for the greatest length of time, and that it has been most destructive among those sorts which are marked by peculiar delicacy. This clearly shows that there must be some cause of the disease in the potato itself, which may indeed be increased by external causes, but which, at the same time, must be regarded as independent of them. With these views, I consider that the means of preventing the taint must be applied both to the removal of whatever of an external nature may be found injurious to its health, and also to the counteraction of its internal causes of disease.

Among the external causes of the evil in question, may certainly be considered an unfavourable state of the atmosphere, though from my own observation, I am inclined to think that this rarely produces a deficient crop, if all other circumstances are favourable. *External drought*, from being adverse to the vegetation of the sets, may, and no doubt sometimes does, subject them to the taint. There is also reason to think that *external moisture*, when accompanied with colds, by chilling the sets, produces a similar result, but these are causes over which we have no control. From the use of *unfermented manure*, the same effect will, in all probability, sometimes follow, and in cases in which the land has not been sufficiently pulverised before being planted, the evil complained of has been found to prevail extensively, and probably through the sets not being sufficiently protected from the influence of the air when the weather has been too dry to be favourable to vegetation. As far,

however, as my own observations have extended, those injuries which the potato itself receives, are the most powerful external causes of the disease in question; and among those by far the most powerful, *their being cut when prepared for planting, and their being deprived of their first and strongest shoots*, which too often happens in consequence of their sprouting before they can be removed from the place in which they are preserved during winter; also in undergoing partial fermentation before and after being cut. These must be regarded as serious injuries, which, although they may not so materially affect the coarser and hardier sorts, I have found to be exceedingly destructive to the more delicate, and particularly those which, by reason of their superior quality, have long been cultivated. We now come to what I consider the very root of the evil, namely, *a predisposition in the potato itself to receive the disease in question*. This predisposition I conceive to result from its having degenerated in consequence of having been subjected to a long course of artificial cultivation; and, therefore, that our attention must be directed mainly to the means of preventing this degeneracy, while we endeavour to remove all such external causes of the disease as may be under our control. That the potato, in common with all other cultivated productions of the vegetable world, has a tendency to degenerate when the laws of nature are deviated from, must be granted; and, considering that it is not a native of this country, it is reasonable to expect that it will degenerate in proportion as means are neglected to prevent it from doing so.

This tendency to degenerate is well known to exist even in trees which are cultivated by grafting; and to such an extent, that many of the first sorts of apple-trees which were formerly cultivated with the greatest care have long since become entirely worthless.

With respect to the potato, nature seems clearly to have made provision for the permanent health as well as for the productiveness of her own offspring, in the seed contained in the berry which the plant produces from its stalks; and consequently, by our endeavouring to perpetuate any particular sort of potato by continually cutting and planting its tubers, it is reasonably to be expected that we shall injure its general properties and powers, and thus gradually render it less fit for food, and more liable to disease. As I have already observed, extensive observation has fully satisfied me that the taint by far more frequently attacks the long cultivated, and more delicate sorts of potatoes, than any others; the former I conceive, because their vegetative powers have become enfeebled and disordered by a long course of treatment opposed to nature; and the latter, because the very delicacy of their constitution renders them more liable than the hardier sorts to disease.

If the foregoing observations should be deemed correct, it will follow that, in order to be as certain of obtaining as good a crop of potatoes as it is possible to be, *the ground before being planted, should be thoroughly pulverized; the manure should be well fermented; the sets should be whole potatoes,\* and never deprived of their first shoots, nor allowed*

\* I would recommend for sets, under all circumstances, old potatoes somewhat under the middling size, or about as large as a walnut, which may either be separated by riddles, or selected by the hand at the time of digging.

to ferment; and lastly that a constant succession of new sorts should be raised from the berries of the old ones. The newly raised sorts would doubtless admit of being cut with safety for several years, and would be but little affected by other external injuries, unless peculiarly delicate, as they would possess all the health and vigour of a plant propagated according to nature's laws. By attending to these few suggestions, the experience of several years of extensive observations warrants me in saying, that a full crop of potatoes may, under all ordinary circumstances of the weather, at all times be secured. I would, however, particularly recommend the raising of a succession of new sorts from the seeds contained in the berry of the most approved old ones, as I firmly believe that the disease complained of is mainly to be attributed to this having been too generally neglected. In the year 1833, I raised from the berry a great variety of new sorts. In 1834, the best of them were selected, and planted separately. At the present time, although planted late and cut, they are displaying an extraordinary degree of health and vigour; while, in the same field, and almost by the side of them, some of the old sorts are not only feeble, but both tainted and curled; thus unanswerably proving the necessity of having recourse to the assistance of nature to counteract the evils arising from a long course of artificial, and in some respects injudicious, cultivation. On another occasion I will, in all probability, send the readers of this Journal an account of the future stages of this experiment.

### PARING AND BURNING.

The process of paring and burning consists in paring off, by means of a spade or plough, the sward or turf of the soil, and burning it, either in heaps or by setting fire to the turfs on edge, and then spreading the ashes upon the surface.

The process must be performed while the weather is sufficiently dry to allow of the combustion of the turf. It may be begun in the month of April, or, if the weather be dry, earlier, and may be continued throughout the summer as convenience or the state of the weather allows.

The instruments employed in this operation are either a species of spade, pushed along partly by the hands and partly by the pressure of the breast, and thence termed a breast-plough, or by a plough so formed as to cut and lay on its back a thin sward or turf.

The spade or breast-plough is a triangular-shaped spade, about 9 inches in length, and 10 or 12 in breadth. It is fixed to a strong handle, with a cross handle at top, upon which the workman presses with his breast, holding the cross handle at the same time. When he has pushed it forward and under the sod for about two feet or more, he suddenly turns it over, and reverses the sod. He then proceeds as before, pushing and turning over the sod as he advances. Workmen with similar spades follow each other, and thus the whole turf is turned over. The depth of the sod cut is generally from  $1\frac{1}{2}$  to 2 inches, or a little more. There is generally a raised edge on one side of the spade, which facilitates the operation.

This instrument performs the work satisfactorily, though it requires considerable manual labour. When the ground, however, is rocky or unequal, it is the best method of effecting the purpose.

But in those cases where the land is tolerably level or free from obstacles, as in the fenny districts of England, where paring and burning are practised to a great extent, it is common to substitute a species of plough, formed so as to pare off a thin sod, and reverse it.

The turf being cut an inch or more in thickness, is set up on edge to dry, and after it has remained in this state for a time sufficient to render it dry enough to burn, it is either set on fire as it stands on edge, or it is collected into heaps. The heaps are set on fire and left to burn, being so covered as that they shall burn with a smothered heat. By this slow combustion the whole heap is equally consumed. But there is often difficulty in getting these heaps to burn, in which case it is necessary to employ straw, furze, and other substances, to maintain the combustion.

When the heaps are burned, the ashes are spread abroad upon the surface, and as quickly as possible covered by a shallow ploughing.

Upon the land thus ploughed may be sown a crop of rape or turnips in the same season, to be eaten upon the ground with sheep. This is the best mode of treating land that has undergone the process of paring and burning. Further, the after-management of land so treated should be as gentle as possible; for having called the productive powers of the soil into powerful action, we must be careful not to avail ourselves of this to rob and exhaust it.

Much dispute has arisen on the advantages and evils of paring and burning.

While it is by some contended that it must exhaust the soil of its permanent sources of fertility, by dispelling the soluble matter which it contains, it is contended by others that any loss of soluble matter from this cause is more than compensated by the increased productiveness of the soil, and the consequent means afforded of adding to its fertility by the greater quantity of manures produced, and that, in truth, experience does not prove that the soil is exhausted of its permanent powers of fertility by this process.

But whatever advantages may result from the practice under certain circumstances, it is known that an injurious use is frequently made of the temporary fertility produced; and that, although in many cases it may be an advantageous method of stimulating the productive powers of the soil, there are many others in which this stimulus is too powerful.

The cases in which paring and burning have been found to be always hurtful, are those of a siliceous sand, with a thin covering of sward. A soil of this sort is frequently seen to be reduced to a *caput mortuum* by the operation. In this case, the scanty vegetable matter which such a soil contains being driven off by heat, or exhausted by a few crops of corn, nothing remains but the barren sand of which it was composed.

All thin soils, however, are not thus injured by paring and burning. Thin chalky soils, and indeed the thinnest calcareous soils of any kind, rarely suffer, except under great mismanagement, from paring and burning. The heat probably acts upon the limestone by dispelling the carbonic acid, and this calcareous matter, converted into quicklime, produces an immediate action upon vegetation. If such land is gently treated and laid down to grass, it will be covered again with a sward, the growth of which will quickly repair the loss of vegetable matter. Thin chalky downs in England have been subjected to a constant repeti-

tion of the process of paring and burning, without any apparent diminution of their fertility.

Again, in the deep peaty and fenny soils, the process of paring and burning may be carried on to a certain extent without injury. Here there is a great excess of vegetable matter, and the loss of a part of it at the surface is not attended with sensible injury. The loss is more than compensated by the increased produce; and if such lands are laid down to grass, without having been too much exhausted by cropping, the production of fresh sward will soon replace the waste of vegetable matter.

Cold clays too have been often much improved by paring and burning. Such soils do not generally contain much vegetable matter, and when that portion of it which is contained in the turf is expelled, a more than corresponding benefit is derived by improving the texture of the soil itself.

"The process of burning," says Sir Humphrey Davy, "renders the soil less compact, less tenacious and retentive of moisture; and, when properly applied, may convert a matter that was stiff, damp, and, in consequence, cold, into one powdery, dry, and warm; and much more proper as a bed for vegetable life."

"The great objection made by speculative chemists," continues he, "to paring and burning is, that it destroys vegetable and animal matter, or the manure in the soil; but in cases in which the texture of its earthy ingredients is permanently improved, there is more than a compensation for this temporary disadvantage; and in some soils, where there is an excess of inert vegetable matter, the destruction of it must be beneficial; and the carbonaceous matter remaining in the ashes may be more useful to the crop than the vegetable fibre from which it was produced."

"All soils which contain too much dead vegetable fibre, and which consequently lose from one-third to one-half of their weight by incineration, and all such as contain their earthy constituents in an impalpable state of division, *i. e.* the stiff clays and marls, are improved by burning; but in coarse sands or rich soils containing a just mixture of the earths, and in all cases in which the texture is already sufficiently loose, or the organizable matter sufficiently soluble, the process of torrefaction cannot be useful. All poor siliceous soils must be injured by it."

The deductions of science here accord with practice. But even in those cases where paring and burning may be recommended, great injury is yet to be dreaded from exhausting by severe cropping the productive powers of the soil thus stimulated. In this manner immense injury may be done, and has been done, and an instrument of beneficial improvement, if discreetly used, converted into a mean of ruining the soil.

When any kind of land is for the first time made arable, a good reason may perhaps exist for this mode of rendering it as soon as possible productive. But after land has been brought into a state of regular culture, it is difficult to believe, notwithstanding the authority of so many farmers in England, that paring and burning are good as a regular system. Great crops are doubtless raised in the Fens and other parts where this system prevails, but greater crops still are raised in the north of England and in Scotland, on inferior soils, and with a less favourable climate, where the system of paring and burning is unknown.

But while paring and burning may be thus judiciously and too indiscriminately practised, and

without the precautions that should attend it, there is no season why we should not avail ourselves of so powerful an instrument of improvement, when it can be beneficially employed.

The cases in which it may be safely used seem to be:—

1, In the case of cold clays, marls, and calcareous soils, when broken up for the first time.

2, In the case of moors, where there is a considerable stratum of peat, and which are broken up for the first time.

3, In the case of deep peaty soils, where there is an excess of undecomposed vegetable fibre.—*Low's Agriculture.*

### EAST-RIDING AGRICULTURAL ASSOCIATION.

The following PREMIUMS will be given, at the AGRICULTURAL SHOW, to be held at BEVERLEY, on Wednesday, the 27th day of July.

To the labourer in husbandry (who has not occupied more than half an acre of land) who has brought up and placed out to service the greatest number of children, without receiving parochial relief	£5
To the second approved candidate	3
To the third ditto	2
To the fourth ditto	1

The premiums to servants in husbandry, being unmarried persons, will be extended to those who have lived in several places, provided they have lived not less than four years in each service; to produce certificates from their masters or families, or in case of their death or removal, from two respectable persons of each service.

To the first candidate	4
To the second ditto	3
To the third ditto	2
To the fourth ditto	1

The same regulation shall apply to female servants and the following rewards given:—

To the first candidate	3
To the second ditto	1

The same regulation be applied to female servants in farming service, and the following rewards given:

To the first candidate	£3
To the second ditto (not living in service as Housekeeper)	2
To the third ditto	1
To the shepherd who has reared the greatest proportionate number of lambs from not less than 100 ewes	3
To the shepherd who has lived the longest time in one service	3

Any person obtaining the highest premium, in any one class, or the second premium for two consecutive years, shall not be eligible to again compete in the same class for the following year.

All competitors must have lived with families resident in the East-Riding, or town and county of Kingston-upon-Hull, during the periods of their servitude.

The second premium will not be given unless there are four competitors; the third, unless five; and the fourth, unless six.

For the best bull, of any age, from any part of the kingdom.....	£10
For the best two-year old or aged bull.....	5
For the best yearling bull.....	3
For the best cow in milk, or in breeding state.....	5
For the second best.....	3
For the best two-year old heifer.....	3
For the best yearling heifer.....	3
For the best tup, of any age, from any part of the kingdom (5 <i>l.</i> by the Association, and 5 <i>l.</i> added by Yarburgh Greame, Esq., of Sewerby).....	10
For the best aged tup.....	5
For the best Shearling tup.....	5
For the best pen of five breeding ewes.....	3
For the second best ditto.....	2
For the best pen of five shearling wethers.....	3
For the best pen of five shearling gimmers.....	3
For the second best ditto.....	1
For the best coaching mare.....	5
For the second best ditto.....	2
For the best mare for breeding hunters.....	5
For the second best ditto.....	2
For the best mare for breeding roadsters.....	5
For the second best.....	2
For the best cart mare.....	3
For the second best ditto.....	2
For the best boar.....	2
For the second best ditto.....	1
For the best sow.....	2
For the second best ditto.....	1
For the best three-year old coaching colt.....	3
For the best two-year old ditto.....	3
For the best yearling coaching colt.....	2
For the best three-year old coaching filly.....	3
For the best three-year old hunting colt.....	3
For the best stallion for getting coach horses.....	5
For the best stallion for getting hunters.....	5
For the best stallion for getting roadsters.....	5
For the best stallion for getting cart horses.....	3
For the best yearling stallion colt by Merry Legs, (given by Robert Denison Esq. of Kilnwick Percy).....	5

The second premium will not be given for cattle unless there are three shown.

The bulls to be kept in the East-Riding, and to serve the cows of the members at not more than one pound each for six months.

The tup obtaining the premium "for the best tup of any age from any part of the kingdom" to be let on the ground to the highest bidder.

The premium to the breeding cows, best heifer, the breeding ewes, and Shearling Gimmers, will not be granted to any cattle fed on any other than green food for four calendar months previous to the show, certificates to that effect to be produced, signed by two neighbouring farmers.

All stock must be the property of persons resident within the East-Riding, or town and county of Kingston-upon-Hull, (except bulls and tups hired for twelve months) and no stallion will be considered qualified unless he has served exclusively within the same limits during the preceding season, certificates of which must be produced to the satisfaction of the secretary.

The committee reserve the power of withholding any of the premiums, should the judges consider there is not sufficient merit, or not in adherence to the preceding rules.

The entry for the premiums to close on the Saturday previous to the show.

**SWEEPSTAKES.**

The following SWEEPSTAKES are also intended to be opened;—

Ten shillings each for the best bull.
Ten shillings each for the best cow.
Ten shillings each for the best yearling heifer.
Ten shillings each for the fat steer, under four years old.
Ten shillings each for the best aged tup.
Ten shillings each for the best shearling tup.
Ten shillings each for the best pen of five suckling ewes.
Ten shillings each for the best pen of five shearling gimmers, for breeding.
Ten shillings each for the best pen of five wethers.
Ten shillings each for the best pen of five shearling wethers.
Ten shillings each for the best boar.
Ten shillings each for the best sow.
Ten shillings each for the best two-year old coaching colt.
Ten shillings each, with 10 <i>l.</i> added by James Hall, Esq., of Scarborough, for the best three-year old coaching colt, bred by, or the bona fide property of the shower twelve calendar months previous to the show.
Ten shillings each for the best two-year old coaching filly.
Ten shillings each for the best three-year old coaching filly.
Ten shillings each for the best two-year old hunting colt.
Ten shillings each for the best three-year old hunting colt.
Ten shillings each for the best coaching mare.
Ten shillings each for the best hunting mare.
Ten shillings each for the best mare for breeding roadsters.
Ten shillings each for the best cart mare.
Ten shillings each for the best stallion for getting coach horses.
Ten shillings each for the best stallion for getting hunters.
Ten shillings each for the best stallion for getting roadsters.
Ten shillings each for the best stallion for getting cart horses.
Ten shillings each for the best yearling stallion coaching colt.

The entries will be made by the secretary, to whom the money shall be paid, and to close on the Saturday previous to the show.

All female stock shown to be the bona fide property of the shower.

All stock intended to be shown to be on the ground by 10 o'clock, and a fine of 2*s.* 6*d.* if after that time; at half past 10, no stock will be admitted except stallions, which will come on the ground at 12 o'clock.

No stock to be removed from the show ground before 1 o'clock, except stallions, which may be removed after they have been shown.

J. B. BAINTON.

Beverly, Jan, 1836.

Hon. Secretary.

**PRICES OF LABOUR.**—The factory operative, in England, works 69 hours per week, for which, on an average, he has 11*s* of wages; in America he works 78 hours and has 10*s*; in France, he works from 72 to 84 hours and has 5*s* 8*d*; in Prussia he works from 72 to 90 hours and has 5*s* 8*d*; in Switzerland, he works from 78 to 84 hours and has 4*s* 5*d*; in the Tyrol, he works from 72 to 80 hours and has 4*s*; in Saxony, he works 72 hours and has 4*s* 6*d*; in Bonn, in Prussia, he works 94 hours and has only 2*s* 6*d*.—*Factory Commission Report.*

## COMMUTATION OF TITHES.

ABSTRACT OF THE BILL FOR THE COMMUTATION OF  
TITHES IN ENGLAND.

[Note.—The words printed in *Italics* are proposed to be inserted in the committee.]

Clause 1. Appoints three commissioners—two by one of his Majesty's principal Secretaries of State, and one by the Archbishop of Canterbury, under his hand and episcopal seal.

2. They are to be styled, "The Tithe Commissioners for England and Wales;" and, by summons under their hands, may require the attendance of all such persons as they may think fit to call before them upon any matter brought before them as hereinafter mentioned relating to the tithes; or, in lieu, may require any person to make and subscribe a declaration. No person to travel more than ten miles from the place of his abode.

3. The Board to have a common seal, and its awards to be received as evidence.

4. The commissioners to report to the Secretary of State, and the annual report to be laid before parliament.

5. The said commissioners may from time to time appoint such persons as they may think fit to be assistant commissioners for carrying this Act into execution, at such places and in such manner as the said commissioners may direct, and in like manner may remove such assistant commissioners, or any of them at their discretion; not to appoint more than *nine* such assistant commissioners to act at any one time, unless the Lords-commissioners of his Majesty's Treasury shall consent to the appointment of a greater number.

6. No commissioner or assistant commissioner to sit in parliament.

7. Commissioners to appoint secretary, assistant secretary, clerks, and other officers.

8. No commissioner or assistant commissioner, secretary, or other officer or person so to be appointed shall hold his office for a longer period than *five* years.

9. Every commissioner and assistant commissioner to make the following declaration before one of the Judges:—

"I, A. B., do declare, That I will faithfully, impartially, and honestly, according to the best of my skill and judgment, fulfil all the powers and duties of a commissioner [or, assistant commissioner, as the case may be] under an Act passed in the sixth year of the reign of King William the Fourth, intitled [here set forth the title of this Act].

Notification of appointment to be sent to Clerks of the Peace.

10. The commissioners may delegate to their assistant commissioners, or to any of them, the powers given to the said commissioners (except the power to do such acts as are required to be under the seal of the said Board).

11. Reasonable expenses of witnesses are to be paid.

12. The owner of any lands and owner of any tithe may contract with each other, in manner hereinafter mentioned, for the commutation of tithe for an annual rent-charge to be agreed upon between the contracting parties, in full satisfaction for such tithe. No such agreement, so far as the same shall relate to any tithes due to any ecclesiastical person, not being a corporation aggregate, in right of his benefice shall be of force for any longer period than during

the incumbency of such person in such benefice, unless the same shall have been confirmed during his incumbency, by the patron of the benefice, and the ordinary of the diocese, or by the commissioners; and no such agreement, if made with the consent only of the owner of an estate in any land or tithes, less in the whole than an immediate estate of fee simple or fee tail, shall be of force for any longer period than during such particular estate, unless the same shall be confirmed by the commissioners.

13. In this Act, the word "person" shall comprise all corporations sole and aggregate; and the word "tithes" shall comprise all tithes, compositions real, moduses and prescriptive payments in lieu of tithes, dues, oblations, and obventions; and every benefice shall be taken to be within that diocese by which it is surrounded, or with which it has the longest common boundary: and the word "lands" shall comprise all messuages, lands, tenements, and hereditaments; and every person in the actual occupation of any lands or tithes, not let to him at rack rent, or any person in the actual receipt of the rack rent of any lands or tithes, either on his own account or as mortgagee or other incumbrancer in possession shall be deemed the owner of such lands or tithes respectively; and the words "rack rent" shall mean any rent not less than *three fourths* of the full improved annual value of such lands or tithes; and every person for the time being entitled to present to the next vacancy of a benefice, shall be deemed the patron of the said benefice: with some provisos.

14. When the same person is owner of lands and owner of tithes, he may be dealt with in both characters.

15. When ownership of lands or tithes or patronage is vested in the Crown, the Lord High Treasurer, or First Lord Commissioner of the Treasury for the time being, where the value of such benefice is of the yearly value of twenty pounds or upwards in the King's books, and where such value is below the value of twenty pounds in the King's books, the Lord Chancellor or Lord Keeper, or First Lord Commissioner of the Great Seal for the time being, shall for the purposes of this Act be substituted instead of the patron.

16. In case the patron or owner of land is a minor, the guardian or committee to act.

17. To every contract which shall be entered into for the commutation of tithe, there shall be parties as well as the owner of the lands whereof the tithe is proposed to be commuted, as also every owner of any tithe arising from or upon such lands, or any part thereof; and in case at the time of the entering into any such contract, the said lands or any part thereof shall have been demised and let to farm, or agreed to be demised and let to farm to any person, such farmer may, with the consent of the other parties to the said contract, join in and be a party thereto, &c., with various provisos.

18. Different owners may concur in one contract, if the land of every owner be sufficiently distinguished.

19. Every contract shall be engrossed or written on parchment, and shall set forth the names and descriptions of the several persons parties thereto, and shall state in what right such persons are respectively made parties thereto, and shall specify the lands whereof the tithe shall be intended to be thereby commuted, &c.

20. Upon the 11th day of October next following the completion of any such contract, the lands specified therein shall, during the continuance of such contract, be absolutely discharged from the payment of all tithes; and instead thereof shall be payable

thenceforth the clear yearly sum agreed to: and such yearly sum shall be payable by two half-yearly payments on such days in every year as shall be agreed to, or if no such days are mentioned in that behalf, then on the 6th day of April and 11th day of October in every year, the first payment being on the 6th day of April next after the lands shall have been discharged from tithe; and such rent-charge may be recovered at the suit of the party entitled thereto, his executors or administrators, by distress and entry, &c.

21. Tithe to be liable to parochial and county rates.

22. Parochial meetings may be called, at which owners of three-fourths of the uncommuted tithes may agree to bind the whole parish, if not appealed from.

23. Assistant commissioners may attend to advise terms of agreement.

24. All agreements to be made known to patron, bishop, and commissioners; and consent of bishop and patron to be made known to commissioners, and published.

25. Appeals from parochial agreement may be made to commissioners within one month; costs of appeal to be paid according to the decision of the commissioners.

26. If no agreement, land owner or tithe owner may call on commissioners for an award; and the commissioners shall hereupon proceed to make and confirm such award, and to assess and certify the costs thereof, and by whom payable and in what proportions.

27. The award shall be binding on all persons and for ever, as if an agreement of the same tenor had been made between the parties in manner hereinbefore mentioned, with the consent of the patron of the benefice or ordinary of the diocese, such consent not being necessary.

28. Value of tithes to be calculated according to the average rate and clear value of tithe during the seven years ending at Michaelmas next preceding the making of the said valuation. Tithe taken in kind, according to the clear value thereof, after making all just deductions on account of the expenses of collection or otherwise. Composition tithe according to the amount of composition or rent agreed to be paid for the said tithe, whether such composition or rent has or has not been actually paid. All these tithes to be valued as chargeable to parochial and county rates.

29. In cases to be modified, notice in writing shall be given that the sum paid for tithe or by way of composition upon an average struck during the said period of seven years, does not fairly represent the sum which ought to be taken for calculating a permanent commutation thereupon, the commissioners shall also ascertain, as nearly as may be, the average rate and gross value of such tithe, if the same had been taken in kind during the whole said period of seven years, without having regard in the valuation to any such composition or agreement, and without making any deduction on account of the expenses of collection or otherwise: and in every case in which the average sum paid or agreed to be paid during the last seven years, as aforesaid, shall appear to be less than sixty pounds for every hundred pounds of the average value of the tithe so estimated, if taken in kind during the same period of seven years, the sum taken for calculating a permanent commutation thereof shall be sixty pounds for every hundred pounds of the value of the tithe taken in kind; and in every case in which the average sum so paid, or agreed to be paid, shall appear to be more than

seventy-five pounds for every hundred pounds of such average value of the tithe taken in kind, the sum taken for calculating a permanent commutation thereof shall be seventy-five pounds for every hundred pounds of such value of the tithe taken in kind, and the average sum so paid, or agreed to be paid, if more than sixty pounds and less than seventy-five pounds for every hundred pounds of such average gross value of the tithe taken in kind, shall be taken without alteration for calculating a permanent commutation thereof.

30. The tithe of hops, fruit, and garden produce is to be valued according to the average rate of composition for the tithe of hops, fruit, and garden produce respectively during seven years ending Michaelmas next before such valuation.

31. All lands, whereof the tithe shall be commuted under this Act, which shall be newly cultivated as hop grounds at any time after such valuation, shall be charged with an additional sum of fifteen shillings per acre over and above the amount of the rent-charge, charged as herein provided, whilst not cultivated as hop-grounds; that no such additional sum shall be charged or payable during the year next after such new cultivation, and half only of the said additional sum during the year next but one after such new cultivation, and that all lands, whereof the tithe shall have been separately valued as hop-grounds, and which shall cease to be cultivated as hop-grounds at any time after such valuation, shall be charged from the eleventh day of October next following the last crop of hops grown on the said lands, in lieu of the rent charge charged thereon as hop-grounds, with the rent-charge, which, in the judgment of the commissioners, shall appear to be the average rate of composition for tithe within the district.

32. Commissioners may employ surveyors, and enter on lands for the purpose of valuing tithes.

33. As soon as admeasurement, plan, and valuation shall have been made, the commissioners to deposit the same at some convenient place within the said benefice, they are also to attend to hear objections thereto, and determine any objections which may be made, &c.

34. Old plans and surveys may be used if the commissioners think proper.

35. The commissioners to determine all disputes, subject to appeal by an issue at law, or by taking the opinion of a court of law or equity thereon, and disputed rights may be compounded or referred.

36. Owners of particular estates, less than fee simple, may charge the costs on the estate for twenty years.

37. The determination of the said commissioners touching any difference, concerning which no power of bringing an action or of stating a case is given, or which shall not be over-ruled by the event of the trial, shall be final and conclusive on all persons concerned.

38. Proceedings not to abate by death of parties.

39. In case of deaths of parties before actions brought, &c. the same to be carried on and defended in their names.

40. After such proceedings shall have been had, and all such differences, if any, shall have been finally determined, the said commissioners shall make an award in writing under their hands concerning the premises, containing all the particulars directed to be inserted in contracts executed under this Act. No such award shall be of any force until it shall have been confirmed by writing under the hands and seal of the said Tithe Commissioners. Three copies of every award and contract under this Act confirmed by the commissioners shall be made, and sealed with

the seal of the said commissioners; one copy to be sent to the clerk of the peace for the county within which is the benefice whereof the tithes have been so commuted, to which all persons interested may at all reasonable times have recourse; another copy shall be deposited in the registry of the Consistory Court of the diocese within which the benefice is situated; and the other copy shall be deposited with the incumbent and church or chapel wardens, or other proper officers of the benefice for the time being to be kept by them and their successors in office with the public books, writings, and papers of the benefice, to which all persons interested therein may have access.

41. Rent-charge may be apportioned on separate fields and closes.

42. The Comptroller of Corn Returns shall cause an advertisement to be inserted in *The London Gazette*, stating what has been during seven years, ending on the *Thursday* next before the *twenty-ninth* day of *September* then next preceding, the average price of British wheat, barley, and oats, computed from the weekly averages of the corn returns.

43. That every contract for the commutation of tithes which shall be entered into, and every award which shall be made and confirmed pursuant to the provisions of this Act, shall be taken to be made and confirmed respectively, according to the prices of wheat, barley, and oats, as the same shall be ascertained by the advertisement so to be published next before such contract shall have been made, or such award confirmed, so that every rent-charge agreed or awarded to be paid by any such contract or award shall be deemed at the time of the entering into such contract, or the confirmation of such award, to be of the value of such number of bushels and decimal parts of a bushel of wheat, barley, and oats, as the same would have purchased at the prices so ascertained, in case one-third part of such rent-charge had been invested in the purchase of wheat, one-third part thereof in the purchase of barley, and the remaining third-part thereof in the purchase of oats.

44. All parties entitled to any such varied rent-charge shall have the same powers for enforcing payment thereof, as are herein contained concerning the original rent-charge.

45. When rent-charge is in arrear for twenty-one days after quarterly days of payment, the person entitled thereto may distrain, with various provisos.

46. When rent-charges are in arrear for forty days after half-yearly days of payment, the persons interested may enter into possession of the lands.

47. Powers of distress and entry to extend to all lands within the benefice occupied by the owner, or under the same landlord or holding.

48. Spiritual persons vacating benefices may recover arrears of rent-charge.

49. Advertisements, contracts, and awards, not to be liable to stamp duty.

50. Contracts for the composition of tithes subsisting, and tithes due, before this Act, not to be affected.

51. Act not to extend to Easter offerings, &c., or to payments instead of tithes in London, or to permanent rent-charges by custom or Act of Parliament.

52. False evidence to be deemed perjury; withholding evidence a misdemeanour.

53. Costs of ecclesiastical title owners may be charged on the benefice for twenty years.

54. And be it enacted, that this Act shall only extend to England.

## AGRICULTURAL DISTRESS—ITS EXTENT—ITS CAUSES—AND THE MEANS AND PROSPECT OF RELIEF.

We would be going in the face, not only of our own admission last week, but in the face of the general assertion of the country, were we to deny that there is distress among our agriculturists; but whilst we assent to this, we are by no means prepared to admit that this distress is either so great or so general as many boldly assert; and we found an opposition to those who are clamorous on this point, upon the events which we daily see passing around us. Looking into these, we do not find that the removal of tenants from their farms is so common as general distress would imply; and were all the removals that take place minutely inquired into, we would find that a great proportion of them originate in the caprice either of landlords or tenants at the expiry of leases—in the misfortunes of farmers by foolish acts of cautionary, or by loss in the sale of their produce—in prodigality; or some other cause than an undue proportion between the value of the produce of farms and the rent covenanted to be paid. Should it be said that our tenantry, generally, though not sold out, are struggling in difficulties, we would reply, that this has been so long said, that it is not now worthy of belief. Had it been as true some years ago that distress generally prevailed, as then loudly asserted, it must, ere now, have proved ruinous, not to a few only, but to many. Besides, in our intercourse with society, we do not find our tenants so dolorous, as great distress would necessarily imply. Meet with them on market days, and you yet hear the hearty laugh which shews that they are not "ill at ease." Look at the respectable appearance of themselves and of their families on public occasions, or visit them in their dwellings, and experience their kind, their ample and highly comfortable fare, and you must come to the conclusion that their farms are yet capable of affording them something more than the mere necessities of life. Were rents unpaid, this position would not hold good; but we appeal to proprietors, and others, whose business it is to collect the rental of the country, whether farmers generally do not pay as regularly and as well as they paid years ago. If asked how we account for this, considering the acknowledged fact, that the rent of land has not fallen in the same proportion in which the value of produce has been diminished, we would answer, that if produce be now lower than it was a few years ago, it is more abundant; not merely from the great improvements that have been made in the country, but from the introduction of bone manure, by which the farmer is enabled to raise a breadth of green crop, before unknown, and consequently to feed an extra amount of cattle or of sheep, and, as a still farther consequence, to raise an extra amount of grain—an increase which will, it is presumed, nearly, if not altogether, indemnify him for the diminution in price. The diminution in price, may, indeed, in a great measure, be considered the result of an increase in quantity; the golden rule in arithmetic—less requiring or giving more—and more less—applying strictly to produce and price. It is not necessary however, in this theory, to assume that the increase of quantity should fully meet the reduction in price, as there are some things in which the farmer himself has the benefit of the reduction. The amount of capital at interest in stock is less. His servants or

labourers are now more easily engaged. His general expenditure is not so great; for in proportion as shopkeepers, tradesmen, or others, with whom he may deal, can purchase farm produce cheap, they can afford to sell or give, at a reduced price, the articles which the farmer requires. To these circumstances we may add, that there is now more of industry, and less of prodigality, than was witnessed—say 20 years ago, when many of our farmers indulged, we would almost say to midnight riot, every time they attended a public market, and brought up their families in extravagance, and in a foolish expectation of the future. Now we behold them, generally, from a consciousness we shall say, of the folly of an expenditure they can ill afford, retiring to their homes with the setting sun, and exacting a fair portion of industry from their children. This is unquestionably a change, but will any one say that it is a pity they are not now enabled to hazard a broken neck at midnight, or to bring up their boys in idleness and extravagance, ere they have learned to hold the plough by which they propose to earn their bread,—the consequence of the former system being, that they had generally ceased to be regarded as gentlemen, when they had reached the age of men.

We shall, however, grant, notwithstanding all that we have advanced, that there is in many cases a continued diminution of the farmer's capital, and in many instances much difficulty in making up the rent—denying only that distress exists to the extent alleged; and having granted this, we proceed to inquire what are the real causes of this state of things? Many, we are aware, would at once throw us back upon a fact we have already admitted, namely, that rents have not fallen in the ratio of produce; but this we hold is not a philosophic or satisfactory cause of the difficulties experienced in the agricultural world. Had high rents been continually obligatory since the establishment of peace in 1815, we would not have disputed the position that the great reduction in the price of produce is the true cause of the difficulties which our agriculturists experience; but since that time almost all the land in the country has been let once, or more probable twice, much of it oftener, and within the period in which agricultural distress has been a leading theme. Nor are we at all aware that those farmers who have recently entered upon leases are one whit more exempt from difficulty than those who have been a considerable number of years in possession. Instead, then, of accounting for the amount of agricultural distress which may prevail, from the fall in produce beyond the fall of rent, we should rather inquire how it is that rents have not fallen to the rate which the price of produce should dictate to the farmer to offer to the proprietor of the soil? A full inquiry into this, would, we suspect, lead us into an extent little suited to the columns of a newspaper: but, anxious to disabuse the public of false impressions, we shall try, as shortly as we can, to place the subject in what we consider its proper light. The cause, then, in our opinion, is compound, not simple; or in other words, we hold that the difficulty experienced is the result of a combination of circumstances and springs of action, rather than of any one circumstance, or any one principle of action in the human mind.

The first circumstance we shall mention, which in our opinion tends to the evil complained of, is the acknowledged fact that we are an increasing and almost overpeopled country, not only in our commercial but in our agricultural districts; for though

much is said about the numbers who emigrate to America or other distant regions, they are as small dust in the balance compared with those who remain at home; and to this increase in population there seems no positive limitation. The extent of agricultural possessions is, on the contrary, determined: improvement may render these more productive and valuable, but the boundaries are by nature defined, and consequently where many wish accommodation, only some can be supplied. Nor is the demand for the possession of lands confined to the natural succession and increase of the agricultural classes of society. There are always a number who have amassed a smaller or greater amount of capital in the commercial world, either at home or abroad, who are desirous of spending the autumn of life in rural retreat, and these competing with the ordinary class of agriculturists are sure to increase the evil which an overdemand is calculated to produce. It is evident therefore, that any one really desirous to possess will bid as freely as he dare, knowing that others will be actuated by the same consideration: and that if he does not thus freely offer he cannot hope to succeed. It may be said that this may induce a person to offer freely, but not beyond what he considers the real value of a farm. There is however another circumstance which should not be forgot; men of comparatively limited capital already engaged in agriculture may continue in a farm and sustain a small loss, and after all not be so much injured as if they had sold out and lived exclusively upon their capital, or at least take as much from their capital as is necessary, with the interest of it, to procure them decent support; they know besides that if they should sell out they must part with many things at a considerable loss, should they soon again, as they generally design, return to agricultural pursuits.—There is moreover in man not only an *amor patriæ*, but an *amor loci*,—an attachment to the place of his nativity, or to the situation where he has for a length of time to reside, the beauties of which he has often looked upon with pleasure, and the society of which has become dear to him from continued intercourse—too oft inducing him to go almost beyond his judgment ere he say farewell. And if discomfited here, and virtually forced to complete in another quarter, there is then too generally either an ignorance of the real value of the lands for which he offers, or a vain, but ultimately delusive hope, that he will, by judicious improvement or dexterous management, make the lands more productive than they have hitherto been, which leads him to bid beyond the proper mark. The law of hypothec, too, it would be vain to deny, has an influence in keeping land somewhat higher than it would otherwise be. We lay little stress upon the influence which this law has in inducing a dishonest person to offer more than the value of a farm that he may obtain possession, and having obtained it gain the protection of his landlord against those to whom he stands justly indebted, as it is well known that this is the exception and not the rule; but were there no right of hypothec, proprietors would be much more chary whom they trusted, and consequently there would be less competition, that is, fewer offerers worthy of being accepted, the result of which would be a reduction of rent,—the market value of any thing, as every one knows, depending upon the relative proportion of supply and demand. Such are some of the circumstances and principles of action which in our opinion operate in keeping land fully higher than the price of produce seems to admit. Whether

there is any cure, or any which it would be proper to adopt, we shall now shortly consider.

The amount of duty upon foreign grain for the last few years has been equal to a complete prohibition, with the exception of Canada, the supplies from which have not been of great amount; it is evident, therefore, that if any efficient relief can be granted, it must be by other means than an alteration in the Corn Laws. With regard to the taxes which press directly, or in any degree exclusively, upon the agriculturist, they are so trifling, that it is equally evident their removal could afford no great relief. The Malt Tax, it is true, is virtually a burden upon agriculture, as the increased price from the duty imposed tends to diminish the consumption of grain, and consequently the demand; but notwithstanding what has been advanced by the Marquis of Chandos, and others who adhere to his views, we are not satisfied that the agriculturists would receive any real, at least any permanent relief, by the adoption of his scheme. Were the Malt Tax removed, and an additional duty laid upon spirits in lieu of the benefit which the distiller would receive, it would, we admit, increase the consumption of malt liquor, and would thus seem to benefit the agriculturist by leading to an increased demand for grain; but if as we think, the increased use of malt liquor would lead to the diminished use of ardent spirits, the amount to the agriculturist would ultimately be more nearly balanced than may at first be imagined. But even were it otherwise, it would only be for a short time, that the relief would be felt. If men in offering for farms now are apt to run beyond the proper mark, in order to obtain possession, they would in future take the benefit resulting from the alteration in the Malt Tax into account, and again run beyond the proper bounds. Nor would an alteration in the currency of the country, even if rendered agreeable to the exploded nostrums of a certain class of political economists, thereby unhinging all the private relations of society, afford the farmers of the country any real relief. As soon as present leases expire, men in competing would take this change also into account, and be induced to offer more freely than they would otherwise have done. In leases, in regard to which the rental depends upon the price of produce, there would not be even temporary relief, as the increased price of the article, resulting from the depreciated state of the currency would only tend to increase the rental of the land—not the profits of the tiller of the soil. In regard to relief from reduction of rents, or liberty to depart from leases when these are held to be unprofitable, we think there can be but one opinion. However much it may be the duty of landlords to relieve tenants in distress, rents and leases are entirely conventional—they are matters in which the Legislature has no more right to interfere than it has in the ordinary transactions of the mercantile world. If there is any one circumstance tending to keep up an undue proportion between rental and produce with which the Legislature could with any seeming propriety interfere, it is in our opinion the law of hypothec; but whilst we would admit the legality of interference on this point, we would much doubt the strict justice, the policy, or the humanity of the deed. No man, we think, will deny that land is the great staple of the nation. The Government may apply to the profits of merchandise, or many other means, in the days of prosperity and peace; but the source to which they could successfully apply in the days of diffi-

culty and of war would be the proprietors of the soil. Our mercantile affairs might soon become deranged; our merchants, our artisans, our machinery might soon take shipping from Bristol to Baltimore, or from Hull to Hamburg; our landed proprietors might alone remain capable of being operated upon by the hand of legislation. Is it not, then, an act of common justice, as well as an act of policy in the Government to protect those now on whom they might alone be enabled to call in the hour of difficulty and distress? We have also said we doubt much if the removal of the law of hypothec would be an act of humanity. How many industrious individuals have, from this circumstance, been enabled to enter upon and continue in farms who otherwise must have remained in the most humble situations in life? How many of the younger branches of the families of farmers have from this circumstance been enabled to enter upon, and continue in possession of farms, who otherwise must have remained drudges with their fathers, or have been forced to emigrate from their native land? Without this the proprietor would not accept,—would not indeed be justified in accepting, offers which he now receives from those who have realized, or who can procure from their friends enough to enable them to enter upon possessions, but who could not offer a sufficient guarantee through the currency of a lease. We do not mean to assert that were the law of hypothec annulled, land would remain untenanted or unproductive; but that it would be apt to fall into a less numerous and less amiable class of men. Those who had by any means been put in possession of wealth would become the principal possessors of the soil, if of an avaricious disposition, heaping wealth upon wealth, whilst the poorer, but often more noble part of our population would be forced to be their dependents. And here the policy of the Government continuing the present law of hypothec again strikes into view, as the generous, though not extravagant, expenditure which is necessary to the revenue of the country would receive a check. It is true that the extensive and avaricious holders of the soil would not live for ever, and that their wealth would fall into the hands of others whose prodigality would probably equal the avarice of those from whom that wealth was derived, and thus the fisc of the country would not be materially injured; but it is not clear, admitting our position that one selfish or sordid class of farmers would succeed another, and one class of prodigals succeed another, and that thus we would have an ugly combination of avarice and prodigality, instead of that beautiful moral picture which we now behold in our industrious, generous, and comparatively happy though not rich class of agriculturists? From these remarks we come to the conclusion that, in so far as difficulty is experienced in the agricultural world, no full or effective relief can be attained by legislative means; and that in so far as it is practicable, the means, if adopted, would engender evils greater than those which at present exist.

The Chancellor of the Exchequer has assured Mr. Barneby, M.P., who was deputed at the recent Bromyard meeting to present a memorial on the subject, that it is not the intention of Government to make any alteration in the hop duty.—*Hereford Journal*.

## HORSEMANSHIP.

## AIDS, CORRECTIONS, ANIMATIONS, &amp;c.

It will be perceived, that, while describing the operation of the hand in the preceding chapter, the subjects which comprise the present article, or division of the work, were necessarily brought before the reader; but as they were noticed only as far as they were intimately or inseparably connected with the subject, it becomes requisite to proceed to further elucidation.

In the first place it may be observed, that aids are the indication of the rider's will to the horse; they request the animal, assist him, and, at the same time, prevent him from acting in opposition to the desire of the horseman. When the positions of the legs and body deviate from the *seat*, (as already described under a separate head) for the purpose of giving assistance to the hands, they are called aids; but when, for the purpose of maintaining the seat, or preserving the balance, they are necessary variations of position, and will be found as many as the variations of the positions of the horse, to which they should always correspond, in order to ensure not only the ease, but also the safety, of the rider.

The aids of the legs possessing a progressive strength, produce effect accordingly, and are thus to be applied or given:—the leg being brought nearer to the side of the horse, is the first degree, or lightest aid. Placing the leg further back, with the toe turned a little out, is the next. The lightest touch with the calf of the leg is the third; and so on, increasing the degree of pressure according to the force or strength of the required aid. The strongest aid is the application of the spur; when the leg is strongly applied without effect, drop the toe, by which the spur will come in contact with the side of the horse; it should be slightly applied,\* and if not effective, should be followed by giving the spur smartly, which is called a *correction*.

Aids with the whip are used, when requisite, to assist or give greater effect to the heel. These consist of gentle taps on the hind quarters, and sometimes on the shoulders. When given on the near side, the hand must be applied behind the back, with the whip held by the fingers somewhat after the manner in which a pen is held, or crossing the bridle-hand when intended for the shoulder.

Corrections are given by the whip and spurs. The common uses of the whip and spurs to animate and quicken a horse are not called corrections, even though they should be applied with severity. *Correction* is administered for disobedience, obstinacy, and vice; and should be so applied that the horse may be sensible for what he receives them. For instance, should your horse kick at the application of the whip to his flank or quarter, you should, at the instant, administer the correction sharply; should he kick at it, give it more severely; by which the animal is made sensible of his fault, and punished for it at the same time.

Good-tempered, well-broken horses seldom require correction; nor indeed should it ever be administered but when imperiously demanded; its general application must depend much upon the sense and feeling of the rider. It sometimes happens that correction avails nothing, as there are some horses, when determined not to yield to the whip and spur, will sooner die than submit; and when the whip and spur have been smartly applied several times without effect, (as will often happen with restive horses) other methods should be adopted, which have been already pointed out.

The method of applying the spur is to lower the toe, that the spur may be given full; and, if necessary to apply the spurs with force, remove your legs from the sides of the horse, by which it is evident your strength for the purpose in question is much increased.

When you correct with the whip, lift the arm high, apply the whip with force, and let the stroke take place behind the girths, round the belly. Sometimes correction is applied forward to the shoulders, but is much less effective than the former method.

Some horses disregard the whip, but answer the spur; others disregard the spur, but are fearful of the whip: but they are not numerous; few horses indeed, are indifferent to the spur.

*Animations* are requests or stimulations for exertion, life, and spirit, and proceed from the hand, the legs, the whip, and the tongue. The first has been already described as one of the properties of the hand. Animations of the legs are an application of them to the sides of the horse to induce him to increase his action. Animations of the whip are slight applications of it to quicken the horse—switching the whip in the air, without touching the horse, will very often answer the purpose. The animation of the legs and whip may be regarded as menaces indicating punishment, if disregarded. The animation or *clucking* of the tongue is too well known and too common, not to be well understood. It is an animation which is pleasing to the horse, as he answers it cheerfully. Of course, if too frequently used, it loses its effect.

Soothings are the opposite of animations. They pacify horses that are timid and easily frightened, and those that have much spirit and fire in their constitutions. They are very effective; but not so often used as they ought to be, since the whip and spurs are frequently applied, where soothings would much better answer the purpose. A horse, as I have already observed, is a friendly creature, is fond of being carressed, and seldom makes an ungrateful return for kindness.

The voice soothes by the soft mildness of its tone, which is well conveyed to a horse in the words—*Poor Fellow!*—*Good Boy!* and the like. The hand soothes by patting. The legs and body by a relaxation, sitting quite at ease. Let it be indelibly impressed on the mind, that patience and good temper constitute two very essential, very effective, and very beautiful principles in the management of the horse. Whenever a rider suffers irritability and passion to prevail, if he be not absolutely foiled by the horse, the business will finish in an unsatisfactory manner on both sides. Persevering mildness will not only accomplish

\* In the phraseology of the school, called a *scratch*.

every purpose, but will establish a consummate friendship between the horse and his rider.

### NATURAL PACES OF THE HORSE.

These are the *Walk*, the *Trot*, and the *Gallop*. There are horses, it is true, which are called *Amblers*, and there are others which will *Canter*; the latter is a short gallop; the former may be called (for the want of a better expression) an artificial movement; they are both, however, acquired from the instruction of man.

### THE WALK

Is performed with less exertion than any of the other paces of the horse, and is the slowest. The action of the walk is the alternate motion of the legs, marking four distinct beats as each foot in rotation comes to the ground; which is performed in the following order:—The off fore foot leading first, marks one; the near hind foot, two; the near fore foot, three; and the off hind foot, four. Though the feet follow each other quick, yet the slowness of the action causes the beats to be flat. The excellence of the walk consists in that degree of union which supports the horse's head, and raises his feet without shortening or retarding the step; and that degree of animation also, which quickens the step and sharpens the beats, without falsifying the time or altering the action. No horse can perform well without the permission or assistance of his rider:—for instance, if the head be not supported, the horse moves in a sluggish manner, and does not raise the foot sufficiently to put it well out, and place it down flat; the step consequently becomes shorter, and the horse is liable to catch or touch with his toe. On the other hand, if the head is supported too high, the horse cannot put his foot out, and the step will be shortened and retarded. Should you animate the horse, to quicken his step, in this situation, he would break time, and proceed into the trot.

### THE TROT.

This is a more animated and quicker pace than the walk, and is thus described: "the off fore foot and the near hind foot, mark one beat; and the near fore foot and the off hind foot, mark another beat; so that the action of the trot is two legs crosswise off the ground, and two legs on, which, in alternate change of situation, mark the time of one, two." It is a difficult matter, however, to ascertain exactly whether, in trotting, the horse really does move in the manner described. I never could completely satisfy myself on this head; but have sometimes been induced to suppose that two legs on one side were raised together, and the horse thus performed the first and second beat. On mentioning the subject to a military riding master, he replied, "that is impossible, as the horse, in that case, must fall on his side." This assertion does not appear conclusive, since we see that human beings or bipeds are under the positive necessity of using this lateral motion in their progression, nature having admirably contrived that while one foot is raised from the ground, the superincumbent weight is supported by the other side. Will not this reasoning apply to the trotting of the horse? However, let the matter be as it may, the

perfection of the trot consists in its suppleness, which gives the horse a free use of his limbs; next, in the union, by which the labour is more equally distributed; then the action, which should be true and equal (by which is meant that the liberty of the fore-quarters is not to exceed that of the hind; nor the hind the fore, otherwise the one will distress the other.) the knee up, the haunches bent, springy and pliant, the step measuring exact and true distances, marking a regular time of one, two.

In the trot, the horse leads with a foot either right or left, as in the gallop, by which the leading side is a little more advanced than the other. Most horses lead with the off leg; but if from fatigue or other cause, the horse changes from the leg to which he has been accustomed, it becomes very perceptible to the rider by the unpleasant motion which is thus produced.

### THE GALLOP.

As the trot proceeds from the walk, so the gallop may be said to proceed from the trot; since, if you animate your horse beyond the trot, he gallops.

The action of the gallop is thus performed:—Supposing the horse to be leading with the off leg, the near fore foot is first raised from the ground, then the off fore foot. These coming to the ground in the same order, the near fore-foot marks one beat or time; the off fore foot passing the other, while both are in the air, comes to the ground more forward, and is the leading foot, which marks the second beat. The hind feet follow in like manner, the near hind foot making a third beat; and the off hind foot, passing comes to the ground more forward, and marks a fourth beat. So that the action of the gallop is the two fore legs leading close after each other, and the hind legs immediately following in like order; which, when true, mark a regular, sharp, and quick time, of one, two, three, four.

The perfection of the gallop consists in the suppleness of the limbs, the justness of the action, and the regularity of the time.

The gallop is not true, when the horse's legs do not follow or accompany each other in the order described;—that is, when the horse leads with the right foot before, and the left foot behind; or with the left foot before and the right foot behind. Likewise a horse is said to be false, if, in galloping to the left, he leads with the right foot; also, if in galloping to the right, he leads with the left foot. For, though his feet follow in exact order, and the gallop would be just, if on a straight line; yet, on circles, or round sharp turnings, the leading foot must be that to which he is going; since the horse is not secure on his legs in these situations, unless the haunches are united and the croup in;—that is, the hind feet describe a circle something less than the fore feet, which secures his balance while he bends, and at the same time prevents his bending so much as he otherwise would be compelled to do, and which would consequently render his feet liable to slip from under him.

Finally, the gallop when disunited, as also when extended to speed, loses its harmony and regularity of time; as, in these cases, the fore legs measure less space from each other; as also the hind legs; which render the beats quicker in each,

and leave a space between the beats of the fore legs and the beats of the hind legs. It is highly imprudent to turn a sharp corner on the full gallop.

### THE STOP,

Or the halt, as a soldier would say, should be governed by circumstances, and must depend principally upon the speed at which you are going. I am perfectly aware that I shall be told by military men, and by professed riding masters (who pride themselves on their knowledge of the manege system) that the stop in horsemanship, is an instantaneous prevention of action, without the least previous indication given to the horse, whereby the animal may become acquainted with the intention of the rider. The following is the language of the school upon it:—"In the manege it is beautiful in effect; shows the great superiority of the rider's hand over the horse; thereby gives him confidence, confirms the horse in obedience, unites him, supple the haunches, and bends the houghs. The perfection of the stop consists in the action ceasing at the finish of a cadence, without breaking the previous time; the horse being so balanced on his haunches, and the animation still alive, that, with liberty given, the horse can advance with the same rapidity as before."

Now, the sudden stop in any pace faster than the walk, cannot fail to have an injurious tendency; and mischief can scarcely fail to result from the practice of it, particularly if the horse be moving rapidly. It will be very apt to spring the sinews behind, sprain the back, or hurt the loins. The military service may require the sudden stop when the horse is in rapid motion, for aught I know; but, let it be recollected that I do not profess to give instructions to our cavalry; and, under ordinary circumstances, I regard the sudden stop as a species of foolery, from the practice of which, as I have already observed, there can scarcely fail to result the most injurious consequences.

When the rider wishes to stop his horse, he should close his arms to his body, taking his pull at the bridle according to circumstances, at the same time pressing the calves of the legs and knees against the horse (according to the pace, &c.) bearing moderately in the stirrups, and leaning his body back. He will thus perceive that he procures a very firm seat, one which gives him great strength, and enables him to accomplish his object in the easiest and the best possible manner. Moreover, let him not endeavour to stop the horse too soon, unless to avoid a precipice or other danger. Let us reflect for a moment on the sudden stop at full gallop, with a weak horse and a heavy rider!

### LESSONS FOR FORMING THE HAND, AND ACQUIRING A CORRECT SEAT AND GOOD BALANCE.

The word *Lessons* would seem to imply the use of a school, and the assistance of a master; and both are highly to be recommended where they can be procured. In many large towns there is a building for the purpose of a riding school. The teacher should be a man of good sense; and should be fully aware that for horsemanship on the road or the ordinary purposes of life, or for riding

to hounds with ease, gracefulness, and safety, manege riding is not a requisite preliminary, nor indeed are the principles of it at all applicable. Should the learner not be able to obtain the use of a riding school or the assistance of a teacher, a grass field will answer the purpose of the former; and the proper application of the instructions contained in these instructions, will enable him to supply the place of the latter very effectually. Let him mark out with strong pegs (which can be easily seen) an oblong square, about sixty yards in length by thirty broad, upon which he can receive the instructions of a teacher, or teach himself, with the assistance of almost any person.

When children are to acquire the art of riding or horsemanship, they must, in the absence of a professed master, be attended by a good tempered groom, or some such person, who, if he will follow these instructions, the object in view can scarcely fail of accomplishment. It may frequently happen too, that grown up persons, utterly ignorant of horsemanship, may wish to acquire the art of riding; in which case the assistance already pointed out becomes necessary, at least in the early stages of the business. There are others, who, having frequently been on horseback, are nevertheless timid or awkward, and anxious to acquire greater skill for the purpose of riding with confidence, ease, and safety. There are others in the habit of riding, who, having acquired bad methods on horseback, have only to study the instructions here given to become expert and elegant horsemen.

A quiet, good tempered horse, with a delicate mouth, is to be preferred for the purpose of instruction, and in the case of children or very timid persons; the teacher should be mounted also for the purpose of riding by the side of the pupil, in order to be able to give the most prompt assistance; unless indeed, the longe is made use of in the first lessons, which is much the safest and best method. What I mean by this is, that the horse should move in a circle, a long rein being held in the left hand of the assistant or teacher and a whip in his right. Where there is no riding school, a large barn, or other building, with a level earth floor, of sufficient extent to allow the horse to form a circle of ten or twelve yards in diameter, would be a good place for the learner to take or practice his first lessons, as the intrusion of strangers might be thus prevented. However, whether in a building or field, let the pupil commence thus:—Let him approach the horse and mount. Having placed himself on horseback, according to previous directions, let the pupil adjust his clothes; let the stirrups be taken a vay, but his legs nevertheless placed in the same position as if his feet were in the stirrups or as nearly so as possible; let him then invite the horse to move (according to previous directions) and commence with the walk, the assistant or teacher holding the long rein in his left hand, the horse describing a circle around him.

By thus commencing without stirrups, the learner will acquire a good balance, and a firm grasp with his knees, legs, &c. After the pupil has acquired sufficient confidence he may trot, and this he will generally be able to perform before the finish of the first lesson. As he improves in his

balance and grasp, he will of course invite or press the horse to increased motion or pace—from the walk to the trot, from the trot to the canter or short gallop—always keeping his eyes on the circle a trifle before the horse. Let him circle to the right and left alternately.

In order to enable the pupil to throw his chest well forward, he may practice with his arms placed behind his back. After having acquired a good firm seat, he may use the stirrups, of the length already described under that particular head; and to the practice of circles may be added that of crossing from one side to another without altering the horse's pace, which will improve his seat as also his handling of the reins. In riding schools, there are figures on the wall for the purpose of directing the pupil; but, if he crosses to the right and left and *vice versa*, it is all that is required, and this can be done as well without figures as with them.

At first a lesson of half an hour's duration is sufficient, which may be increased to three quarters, and ultimately to an hour, resting a few minutes occasionally for the purpose of relief both to the horse and rider. I strongly recommend also occasional practice without the stirrups: indeed the commencement of every lesson should be thus performed.

As soon as the learner has acquired sufficient confidence he should finish each lesson with the leaping bar, beginning with it low and increasing the height by degrees, but never beyond four feet: nor should the horse be put over it more than six or seven times each lesson, lest the animal become disgusted, as no horse leaps willingly under such circumstances. Let the horse be walked quietly up to the bar, and take the leap standing, and as the learner becomes familiar with this department of the art of horsemanship, he can walk, trot, canter, or gallop to it, just as he pleases. It is generally said, that it is much more easy to sit the flying leap, than the standing leap, and such is the case under ordinary circumstances; but it is, nevertheless, strictly correct that the learner should commence with the standing leap, as it is much less alarming to him. The matter is quite different with an experienced horseman. A learner will contrive to keep on the horse in a standing leap, but the increased force or animation of the horse in the flying leap would alarm him, and he would be very liable to fall. Where the leap is of considerable height, the horse should be put briskly at it.

The subject now brings me to the position of the rider while leaping, which, however, in the modern phraseology of sportsmen, is called *jumping*.

### LEAPING.

This is an operation which is highly interesting to youth, and it must be admitted that there is something pleasing and even picturesque in it when well performed. I have many times observed bold riders after hounds, who nevertheless sat very awkwardly over their jumps; and for leaping to be accomplished in a proper or masterly manner, practice, judgment, and dexterity are requisite. The horse should come fairly up to his jump, and should receive just that degree of support from the

rider as is consistent with correct performance, and no more. It is a pretty art to put a horse well over his jumps.

I directed that the pupil should take his early lessons in horsemanship without stirrups; but in going over the bar, I recommend the use of stirrups in the first instance, which will give the rider more confidence, (since it is much more easy to jump with stirrups than without them) and after a lesson or two, I recommend him to practice without them.

As I have, in the preceding pages, repeatedly mentioned, that the great secret or art of horsemanship consists in the rider taking a corresponding position to that of the horse, I must remind the reader, that, in leaping, the truth of this maxim is strikingly exemplified. The position of the rider should change with that of the horse; for instance, when the horse is brought to the bar, the rider's body, should be upright, his legs applied firmly to the horse's sides, a trifle backward than a perpendicular, (by which the rider acquires a stronger hold with the knees and the calves) by which the toes become rather sunk, and if the toe be a little turned out, it will strengthen the muscular grasp. The stirrups should be of that length, so that, after you have assumed the position just described, you bear very little in them, but which will receive the usual weight which you bear in them as the horse lands on the other side. The hand of the rider should be placed in the centre, and low, the reins not too short, but that just by the pressure of your fingers you can feel the horse's mouth.\* In this position the rider should approach the bar, when the pressure of his legs and movement of the hand will invite the horse to rise, and as he rises, the body of the rider must come forward so as to preserve its perpendicular, or perhaps describe a very trifling inclination forward—the back kept in, the head firm. At the instant the horse takes his spring from his hind legs, the rider should slip his breach under (as it were) or forward, and let his body go very freely back—the hands down, legs close—till the horse's hind legs have come to the ground.

By way of elucidation, I will state the reasons for the particular directions which I have given in regard to leaping. I desired the hand to be kept low; since, if it were elevated, it would raise the horse's head and nose, and straighten his neck, in which position he would not be able to unite or gather himself for the purpose of rising and taking his spring. Let us for a moment look at a horse when at liberty in the field, since it is no uncommon circumstance for a horse to jump over the fence from one field to another; in this case the animal is unrestrained, and will perform the act of leaping in a manner the most pleasant and easy to himself, the most natural and the most correct. It will be perceived that the horse lowers his head, draws himself together, rises and takes his spring; and therefore when riding over the bar (or any other leap) the nearer we can approach the natural position, the more likely we are to perform the leap

\* Under the head "Riding to Hounds," more has been said upon the subject of leaping, as in hunting jumps are presented under all possible forms.

correctly, with ease and safety to the rider and also to the horse.

If a horse is forced to leap with his head held up (or even too tight) he cannot clear the jump—he cannot do otherwise than make an awkward business of it, and if he gets over, most likely all the four feet will come to the ground together, making what is called a *buck leap*, which is very unpleasant to the rider and also to the horse. I have seen horses which had contracted the habit of buck leaping; but such horses never leap well, and are unpleasant to ride.

As to what is called *lifting* a horse at his jumps, (a term constantly in the mouth of ignorant and unskilful horsemen) three times out of four it obstructs, rather than assists, the horse. Lifting can only be put in practice by a skilful horseman. When the horse rises, his mouth should be felt as lightly as possible, if at all, (I am supposing the standing leap) the hand, however, should support him gently from the moment he has taken his spring till he has fairly landed, the bearing of which should be tighter or more heavy as his fore feet come to the ground, which will materially assist both the horse and his rider. In the *flying leap*, as the horse goes with force, he will require more support from the hand, but precisely in the same way. The manner in which I have seen lifting practiced by ignorant riders is merely lifting or pulling up the horse's head, by which the animal is in general disabled from clearing the leap. When, in hunting, horses become fatigued, they require greater support from the hand, and may be materially assisted, if lifted judiciously.

The raising of the hand when the horse is rising at the bar, in those who are learning to ride, arises from fear; they attempt to hold on by the bridle, which method however, they must abandon, or they cannot succeed. The hand raised in this situation prevents the rider from leaning his body back; and if the horse makes a resolute or strong leap, the rider must be plucked or pulled out of the saddle upon the horse's neck.

The close application of the legs to the sides of the horse is so obviously necessary as to require no explanation. It will be perceived, page 187, that I direct the toe to be inclined downwards, which is contrary to the rules of the manège, the teachers of which direct the heel to be sunk, and the toe to be raised. To place the matter beyond all doubt, let any person get on horseback, try both positions, and then judge for himself. He will find, with the heels sunk *as much as possible* (for such are the manège instructions) the muscles of the legs become extended or stretched, and lose all compressive force or grasp; with the toe inclining downward, and the heel consequently raised, he will find himself enabled to grasp very firmly with the knee and the muscles of the legs, as I have already observed in the preceding pages. In fact, in one case you ride by the balance; in the other, you are enabled to give great assistance to the balance by the compressive force of the muscles,—you may get safely over by the balance if all goes right and smooth; but, should the horse swerve, or any irregularity occur, your seat will be disordered at least, and you are very likely to be thrown.

With respect to the back of the rider being hollow; were the body to be brought forward with a round back, it could scarcely assume the leaning position backward in time; whereas, if the back of the rider be hollow when the horse springs forward, it will naturally fall into the proper position, if the hand be not raised to prevent it.

If the head be not held firm, the action of leaping might occasion the rider to bite his tongue, or possibly cause a wrench of the neck.

Slipping the breech forward (under you as it were) gives the body more liberty to lean back; and unless the body is well back when the horse's feet come to the ground, the shock will move the rider forward, and in consequence, the horse loses the support of the hand, and both are in danger of falling. If you assume an upright position, or move your legs from their proper situation, before the leap is completed, you can scarcely escape disorder, loss of balance—perhaps a fall.

By leaning the body very freely back, the rider not only assumes the corresponding motion of the horse, but can also take firmer hold with his legs. A little practice will soon convince the learner of the truth of what I have just stated.

Let it be recollected that when the leap is well performed, the rider should be able to carry over the bar a shilling or halfpenny under each foot, each knee, and one under the rump. The seat should be close; if the breech or seat be ever so little raised from the saddle, there must be something wrong.

Leaping may be regarded as the very essence of the science of horsemanship, since it is upon the same principle that the seat must be maintained in all violent exertions or difficult situations of the horse.

#### ON BREWING.

The following is extracted from '*A Practical Treatise on Brewing and on Storing Beer, deduced from Forty Years' Experience,*' by Mr. BLACK:

"Most brewers use the soft water; yet some prefer the hard. Hard water, in my judgment, never obtains so good an extract from the malt; many however, think that the beer brewed from it is not so apt to fret as that which is brewed with soft. I am of opinion that a good fermentation, and subsequently good storing, will at all times prevent fretting in the beer. I should, therefore, recommend soft water. That which runs over chalk or limestone, and which is free from sulphate of lime (gypsum), is best. Where the water is hard, I would recommend throwing a little vegetable alkali (subcarbonate of potash) into the liquor in the copper before mashing. In adding this salt, take care that the water does not turn turmeric paper red; should it do so, the salt is then added in excess, and will do harm. I do not attribute the flavour of either the Burton or Scotch ale to any thing in the water.

"I would never recommend the month of October as the best brewing month, particularly for keeping beers. Fine open frosty weather will always be found more favourable to fermentation, and such weather I would always select for brewing keeping beers. Indeed, I am pretty sure that the beer brewed in frosty weather will always be found sounder than that brewed in muggy weather. In frosty weather the fermentation, if other causes do not prevent it, will

always be vigorous and healthy; and a vigorous and healthy fermentation is indispensably necessary for all beers intended for keeping, or exportation to a warm climate. I have often seen in the month of October more inert fermentation than in any other month in the year. And, as already stated, this fermentation is the most deceitful which can occur. I would, therefore, defer brewing any keeping beers until it can be done in frosty, or, at all events, cool open weather, which may be expected in December, January, February, and March. During these months, all keeping beers should be brewed, and when brewed they should be exposed as little as possible to the action of atmospheric air."

On the important topic of drugs (for, in the declining state of beer brewing, as well as in human consumption and other maladies, the doctor is called in), our authority offers the following observations:—

"Although, generally speaking, I object to every kind of drug in brewing, it would be folly to suppose that we can at times dispense with them. When every thing is going on well, no drug is necessary; but when sickly, a chemical remedy must be applied, and it is only then a brewer has it in his power to shew his skill by using proper remedies. He must, therefore, have some knowledge of chemistry, so as not to make use of any thing which may hurtful, or perhaps cause combinations which might turn out to be poisonous. We all know that sugar by a very simple chemical process is converted into oxalic acid—a deadly poison: so that a brewer, having no knowledge of chemistry, might from ignorance convert the saccharine of his worts into poison; or, by improper combinations, make his beer very deleterious. No man, therefore, without some knowledge of chemistry, is justified in trying experiments with an article of general consumption. The law, as it at present stands, forbids the use of chemical remedies; but I should suppose that its object is merely intended to prevent the use of deleterious ingredients, or substitutes for malt and hops. There is no law in France to prevent the flavouring of wines in any way the manufacturer may think proper, and there are very few French wines which are not in some degree artificially flavoured. When harmless ingredients, therefore, are employed for the purpose, I can see no objection to their being used; and if the law of this country did not forbid their use, I believe the introduction of more deleterious ingredients would soon be discontinued. How many travellers do we see traversing the country in all directions for the purpose of selling drugs to brewers, and that in such quantities as to make something like an apothecary's shop of a man's stomach. One drug is for the purpose of making the beer keep—another very desirable object—another for giving flavour; another to produce vivacity, &c. &c.; and the ignorant brewer is always induced to try them, by being told by these itinerant gentlemen that such and such eminent brewers always use them, and cannot do without them; although perhaps those eminent brewers have never seen or heard of such ingredients. Other brewers in the country are anxious to impart what is called the London porter flavour, and are told that it is impossible to do so without the use of these noxious drugs. I firmly believe, however, that no house of any respectability in London makes use of any other ingredient than those authorised by law, and yet the different flavours of the respective houses, proceeding from their various modes of working, are easily distinguished by a good judge. Any brewer, therefore,

using such drugs, without knowing their component parts, may absolutely, although very innocently, be making chemical combinations which will convert his beer into slow poison. Quite as good beer may be brewed from malt and hops alone, as can be produced with the assistance of any other ingredients whatever. But when we hear people say, 'Why cannot you give us beer of the same flavour as such another beer?' I reply, 'That the law will not permit it; such beer is flavoured with ginger, coriander seed, iris (orrice) root, &c., all harmless ingredients, but prohibited by law.' This law, as already stated, was made, I believe, for no other purpose than the prevention of the use of deleterious ingredients, or substitutes for malt and hops. Were it altered, however, so as to permit the use of harmless flavouring ingredients, not one half of the quantity of deleterious drugs would be consumed, which are now resorted to by ignorant brewers. Why should the brewer in England be prevented from giving to his ale a *bouquet*, after the manner that the French give a *bouquet* to their wines? I am surprised that this is not more practised in private brewing, where there is no such restriction; for instance, a pine-apple, raspberry, or strawberry flavour given to ale would be very pleasant, and impart to it a *bouquet* similar to the French champagne. There is also a substance which was, some time ago, in almost general use in porter, viz. sulphate of iron or salt of steel. The law, however, has imposed severe penalties on the use of it, and a test is applied for detecting its presence. The sulphate of iron is called, in the trade, heading, and gives to the beer a fine frothy top, which adheres to the pot or glass from which the beer may be drunk. It also imparts to the beer a sharpness of taste, generally much liked by porter drinkers. This heading when applied in small quantities, little more than a quarter of an ounce per barrel being necessary to produce the effect wanted, is not in the opinion of medical men deleterious, excepting to those of plethoric habits, who do not generally drink beer; on the contrary, it is deemed to be a good tonic, and in foul beer would make it more wholesome than it would otherwise be. It is certainly not a substitute for either malt or hops; and as people in general prefer porter which carries a good head for a long time, there is no good reason why it should be so severely prohibited by law. A substance is, I understand, made and sold by a chemist in London resembling capillaire, of which he sells considerable quantities. I am told that about one quart of this, when put into a barrell of thirty-six shillings beer, gives it a fullness equal to that at forty-eight shillings; and thus those that like very sweet beer are imposed upon. This, therefore, is certainly a substitute for malt, and should be looked after accordingly."

MONTREAL, Jan. 3.—At the opening of the navigation in the Spring of 1835, and for some few weeks after, very little spirit was exhibited in Wheat and Flour, and prices were unusually low. Lower Canada Wheat of the crop 1834, which was upon the whole of indifferent quality, did not rate higher at the early period of last Summer, than from 4s to 4s 6d per minimot, and that of Upper Canada which was mostly of prime quality, about 3s per bushel at the shipping ports on Lake Ontario. As to Flour, best brands Upper Canada fine were dull at 22s to 23s, and the trade confined almost entirely, even at these low rates to a trifling consumptive demand. The prospect for the season was at this period most gloomy. The Wheat crop of 1834 had been, in Upper Canada particularly, unusually heavy, but the depressed state of the English market, both in Wheat and Flour, forbid the expectation of a shipment

thence of either article, except at a ruinous loss. Indeed intelligence was early received of an intention to ship large quantities of Wheat, lying in bond at home, to Quebec and Montreal, which intention was subsequently carried into execution to a considerable extent. The low price of Flour in New York at this period excited some apprehension that heavy quantities would be exported thence to Halifax, for the supply of that and the other lower ports. Under such a combination of discouraging circumstances, the millers, though their stocks of Wheat had been laid in at unusually low rates, had good ground to apprehend a disastrous season's business. In the month of July however brighter prospects began to dawn upon the trade. Flour advanced in New York; heavy contracts were made for future delivery there; the receipts of Wheat as well as Flour from Ohio, a great grain-growing and manufacturing state, began sensibly to diminish; on investigation it was discovered that of the crop of 1834, an unusual proportion had been manufactured and sent to market in the fall of that year, occasioning a sensible deficiency in the balance of that crop for the manufacture of 1835. Speculation, always rife among our enterprising neighbours, was now alive, from the Atlantic markets through the whole west and south. Bread stuffs, as also every description of coarse grains, produced in the country, reached a price in the markets of the United States, unprecedented for a long period. Up to the moment of the new harvest, and until its product in the shape of new Flour reached the markets, this state of things continued presenting a degree of activity seldom before witnessed. It was but reasonable to suppose that so much excitement in the States, would direct the attention of their millers and speculators to the fine Wheat-growing districts in Upper Canada; and such was the fact, purchasers from the United States appeared in all those districts, and large as was the quantity there for sale, it did not exceed their wishes. The number of bushels purchased in Upper Canada and transported to the United States has been estimated at 300,000, and of Lower Canada probably about 50,000 bushels, all of which, on its introduction into the United States, was chargeable with a duty of 25 cents, or 1s 3d the Winchester bush. This was not the whole of this unusual and apparently unnatural feature of the trade. Flour of Canadian

manufacture, was also sought for, and favourite brands of fine, in large quantities, were purchased, transported to the States, and a duty of 7-8ths of a dollar per bbl paid, much of which passed inspection there as superfine, and yielded a fair profit, no doubt, on the investment; we have also good ground for congratulation, that remunerating prices to the manufacturers have been generally obtained, and fair returns to the shippers to Halifax, Newfoundland, and New Brunswick markets have also been received. In July the price of fine averaged about 26s, super. 30s 3d; in August, fine, 28s, super. 32s; September, fine, 27s 6d, and super. 30s. The crop of 1835 in the Lower Province has proved considerably below an average, and both the quality and condition are generally so inferior as to render it unfit for shipment to Europe; the demand for consumption still keeps up prices, old Wheat being now worth 5s 6d, and new of tolerable quality, 5s per minot. In Upper Canada the crop is reported to have been above the average of late years, but in many districts very poor as regards quality, being sprouted and otherwise damaged. The demand, however, from the States during last Summer having nearly exhausted the stock of old Wheat there, the price of new is maintained, and 3s to 3s 3d per 60lbs is paying at the shipping ports at the head of the Lake Ontario, and 3s 6d to 3s 9d per 60lbs at Cobourg, &c. Even in the event of the state of the home markets warranting shipments from hence next season, but little Wheat would be found in either province in a fit condition to transport. It is, therefore, probable that the demand will be limited to what is required for the consumption of the provinces, and what may be exported in the shape of Flour to the Lower Ports and West Indies. The FLAXSEED produced in this province over and above what was required for the next year's seed, has, until within the two last years, been chiefly used in the crushing mills in the province. It was long the custom with the country people to barter Flaxseed for Liverpool salt, minot for minot; of late, however, an active demand has sprung up for the article for shipment to New York, and it promises to become of some importance in our commercial intercourse with that city. All offered for sale here since last Autumn, has been readily taken at prices ranging from 6s 6d to 7s 6d per minot.

COMPARATIVE TABLE,

*Shewing the relative Value of Irish Grain in London, Liverpool, and Glasgow.*

TO THE EDITOR OF THE MARK  
LANE EXPRESS.

*Lynch Court, near Leominster.  
Jun. 23, 1836.*

SIR,—In my last letter to you on the subject of Agricultural Distress, I promised at some future time to send you my opinion as to the measures which I considered most likely to relieve it. I will now endeavour to redeem my pledge; but before I do so, I must beg to say a few words upon the observations you have made at different times in your paper and endeavour to show that your views of the subject are erroneous, and that the plans you recommend will be ineffectual in producing the anticipated result. In a letter addressed to you by Mr. Knight of Downton Castle, (and which has run through the whole radical press of the kingdom, accompanied by your encomiums) he states, that the only thing necessary for the relief of the farmer is a reduction of rent. Now Sir, you stated, I think in your last paper, that some of the parties concerned in the Mark Lane Express had been practically concerned in agriculture, to them then I appeal for the truth of the following observations:—If a man occupies a farm purely arable, or two-thirds of which shall be arable, he cannot continue to cultivate it, unless he returns four rents, if therefore, you were to reduce the existing rents one-third, you would only diminish the outgoings of the farmer one *twelfth*. Now Sir, I would ask any man occupying such a farm, whether a reduction of one-twelfth of his expenditure would make the balance of his account a favourable one? Thus it appears, that a reduction of one-third of the present rents would be of no avail in redressing the grievances of the arable farmer, and even you Sir, I think, will admit that such a reduction is wholly impracticable. I am most ready to admit that Mr. Knight is a very good landlord, and I have no doubt there are hundreds of others as good as he, only they may not have trumpeted their own fame quite so loudly; but it must be borne in mind, that Mr. Knight is placed in peculiarly favourable circumstances as to his property, he received his estate late in life when his habits were formed, from an elder brother, who was a bachelor, consequently it descended to him unincumbered by jointure or by raising money to pay the fortunes of younger children, consequently he has it in his power to do more for his tenants than those landlords can, whose estates are encumbered and who have a family of younger sons to educate and put out into the world. I have no doubt that if even the ineffectual reduction I before mentioned of one-third of the rent was to take place, it would in two or three years place one-third of the landed property in the hands of money lenders; and the farmers must not expect that these men, who are total strangers to them and who have only taken their estates as security for money advanced by them, will make better landlords, than those who have been brought up with them from their infancy and whose fathers have, perhaps, sustained the relative situations of landlord and tenant for years. I am convinced that any reduction of rent, adequate to the altered price of agricultural produce, is perfectly chimerical and impracticable; but supposing for the sake of argument that it were practicable, who would be the losers by the alteration? In this case the gentlemen of landed property must lower their establishments, must discharge their servants, lay down their carriages and diminish their expenditure in every way, the loss of which would fall most heavily upon the merchant, the manufacturer, and the tradesman. If rent is to be lowered the price of every article in common use

must be lowered also, and this will so reduce every body's income, that if the interest on the national debt is to remain the same, it would absorb so large a portion of the general income as to render it impossible to collect it. I am convinced in my own mind that the only effectual mode of relieving the distresses of the farmer is either by raising the national income to something like what it was when the debt was created, or by reducing the interest of the debt so as to bear a fair proportion to the altered money value of agricultural produce. As the latter plan would probably create much opposition, and would at present be attended with much difficulty, and as I am, by no means desirous of setting up theories however fair in themselves, that are not immediately reducible to practice, I shall confine my observations to the first proposition; though I do not see any reason why the interest of the debt should not be reduced; the greater part of it was funded at or about fifty and that paid in depreciated paper, so that the public did not, in fact, receive more than thirty-five pounds in gold for every hundred for which we are now called upon to pay three per cent. or about seven per cent. interest on the money actually received. As money can now be borrowed at three and a half, I do not see why the public creditor should be better off than the rest of the monied interest. But this is by the bye; as I said before it will be better to address ourselves to the more practicable plan of raising the national income. I proposed last sessions to the members of the present government, that instead of increasing the already overgrown national debt, by raising a loan of twenty millions to pay the West India merchants for the emancipation of their slaves, the lords of the treasury should issue that amount in one pound notes which should be made a legal tender for all taxes and duties payable to government, and that country bankers should be allowed to give them in exchange for their five pound notes. If this plan had been adopted I have no doubt the situation of the farmer would already have been very different from what it now is, as it would have enabled the country banker to have made advances to the farmer by means of which he would have been empowered to withhold his produce from a glutted market, and thus have prevented that ruinous depression in price, at which, under existing circumstances, he has been obliged to dispose of it. Besides this advantage, government would have paid six hundred thousand a year interest on this twenty millions, which might have been applied to the reduction of such taxes as pressed most heavily on the farmer; such as the remainder of the county rates, the statute duty, &c. This measure was free from all the objections urged against an unlimited issue of one pound notes by country bankers, as the holders would have had the same security for them as they have for the funded property. That opportunity, however, is gone by; the Chancellor of the Exchequer did not choose to adopt my plan, nor did he condescend to assign any reason for rejecting it. The same object may yet be obtained by the treasury issuing one pound notes instead of exchequer bills, by which the interest would be saved. To explain the whole advantage of this measure, I find would extend my letter far beyond the bounds which a newspaper correspondent has any right to occupy in your columns. I will, therefore, content myself for the present with merely throwing out the hint, which others may improve upon, and conclude my letter after having made one observation on your leading article last Monday. You congratulate the Scotch farmers on their prosperity, which you attribute to their superior skill.

Do you mean to assert that the land in Scotland is better farmed than it is in Essex, Norfolk, or the Isle of Thanet? I think it would be more fair to ascribe it to the only advantage which they possess over the English farmer, namely, to a small note circulation, it is very extraordinary that if one pound notes are so prejudicial to the national welfare, that the shrewd and sagacious Scotch should have resisted their annihilation in that country so strenuously, that Sir Robert Peel dared not urge the matter further, for fear of losing his bill. As I have already trespassed too far upon your columns, I will only add that I remain,

Your obedient servant,

J. R. SMYTHIES.

### ARCHBISHOP WHATELY'S PLAN FOR SETTLING THE TITHE QUESTION.

A correspondent writing on this subject, after cautioning the Conservative party against interposing "visionary and speculative obstacles to any measure (from whatever quarter it may come) by which the substantial and tangible evils of the existing state of things may be remedied," proceeds to say—"If tithe be commuted into land-tax, and if this land tax be bought up by the state from the church, the money paid will be as much the absolute, independent, and intangible possession of the church as any other ecclesiastical property it has ever held: and if this money be afterwards expended in the purchase of land, that land will be as much the independent estate and possession of the purchasers (namely, the church, through its acting body, the commissioners), as any college estate, house, rent, manorial right, or other hereditament. The whole gist of the proposed measure is this.—Will capital be forthcoming, to realize the benefits proposed by the Archbishop's plan? If it be not, such matters will be employment for tongue and pen for half the session, and there an end. But if the resolution be evinced to cut the Gordian knot by the only possible means, viz.—money, then the Archbishop's labours may effect the redemption of the Irish clergy, and the peace of their country."

### PROPOSAL FOR ESTIMATING THE RENT OF LAND BY THE MARKET PRICE OF WHEAT.

In making this estimate, the following particulars must be accurately ascertained:—The quality of the land, and its state of cultivation. Whether it has on it all necessary buildings. Whether titheable or tithe free. The annual amount that it pays for parochial rates. The distance that the land is from the market where its produce is to be sold; and what price per bushel may reasonably be expected for wheat—which, in the long run, governs the price of all grain, and of meat too. Therefore, as the price of wheat rises or falls, so does the actual value of the rent of land. The value of rent for the different qualities of land will vary from two to six bushels per acre—the regulating price to be annually that which has been the average price of a market agreed on for the past year. Supposing it is agreed that 7s per bushel may be expected, the rent of the different qualities of land may be thus calculated:—

Very poor land.....	2 bushels..	14s. per acre
Poor.....	3 ditto....	21s. ..
Fair quality.....	4 ditto....	28s. ..
Very good .....	5 ditto....	35s. ..
Extraordinarily good	6 ditto....	42s. ..

The intermediate qualities may be raised by the corresponding fractional parts of a bushel: thus—a medium quality, between fair and very good,  $4\frac{1}{2}$  bushels, 31s. 6d. per acre; approaching nearer to very good,  $4\frac{3}{4}$  bushels, 33s. 3d. per acre. This method of estimating the rent of land may appear complicated and troublesome, and therefore I do not expect to hear that many farms will be let in this way, although I believe it to be the fairest between landlord and tenant. Some years ago, a great portion of the stewards of landed proprietors were composed of lawyers, land surveyors, and others, who knew little or nothing of the real quality of land, or the proper cultivation of it. All the object in view of such stewards was to increase the rental of their employers; on which increase it was then a common practice for them to receive a commission; so that industrious tenants under their controul, whose farms appeared neat, were liable to have their rents raised; and the crafty, or negligent, whose farms appeared unsightly, theirs not raised, but perhaps lowered, which is exactly the reverse of what just stewards between landlords and tenants ought at all times to do.

Some years ago, I proposed a commutation of tithes to be made out by the same mode as I proposed for estimating rents, and I still think that a fairer plan cannot be adopted; every farm in the parish being valued according to the quality of the land, and not according to its state of cultivation. Suppose a farm of 200 acres, 100 arable and 100 pasture, coming under the description of very good land, if tithe free, and only moderately burdened with poor, the rent should be equal to the value of five bushels of wheat per acre; if the average price was 7s. per bushel, the rent would be 35s. per acre. Take one-fifth of the arable and one-ninth of the pasture, thus:—100 acres arable, 500 bushels—one-fifth, 100 bushels; for the pasture, one ninth,  $35\frac{1}{2}$  together,  $155\frac{1}{2}$  bushels, at 7s. per bushel, £54. 8s. 6d. per ann.—about 5s. 5d. per acre. In May, 1835, I printed all the particulars of my plan for a commutation and redemption of tithes; having several copies left, one is at the service of any person interested in tithes.

I cannot refrain from inserting here a question in figures, which I have found many were not aware of. Suppose a parish, going to be enclosed, containing 2000 acres, 1000 arable, 1000 pasture, the tithe-owner claiming one-fifth of the arable, and one-ninth of the pasture; I have found that most to whom I have stated this, have thought, as the quantities were equal, that if one-seventh of the whole were taken, it would be the same as taking a fifth and a ninth; which it is not, as thus:—One-fifth of 1000 is 200; one-ninth of 1000, 111 one-ninth; together, 311 one-ninth—one-seventh of 2000, is 285 five-sevenths—difference, 24 acres and about a half.

It has often been asserted in the House of Commons, and elsewhere, that permanent low prices of corn would not affect the farmers, that landlords only would be affected by it, for they must lower their rents; this I trust I shall be able to prove by the following statement to be a most mistaken notion.

A Summary Calculation of the Value of the Produce of Farms, of different descriptions of land, with Wheat at seven, six, and five shillings per bushel; the prices of other grain in proportion; the profit arising from Cattle, Sheep, Pigs, and Poultry; the amount of Rent and Expenses; and the Occupiers' Incomes. Also supposing that each farm was tithe-

able, the amount to be paid per acre and per annum according to my mode of estimating the Value of Tithes—

2000 Same farm 2000 180	Number of Acres, tithe-free.		Quality.	Wheat at 7s. per bushel.		Wheat at 6s. per bushel.		Wheat at 5s. per bushel.		Occupiers loss of income with reduction of rent, wheat being reduced from 7s to 5s per bushel.	If the farms were titheable, and wheat 6s. per bushel, the tithe would be.			
	Arable.	Pasture.		Rent per acre.	Whole Rent.	Value of Produce & Profit of Stock.	Amount of Expense.	Occupier's Income.	Rent per acre.			Amount of Rent.	Value of Produce & Profit of Stock.	Expenses.

At present, other grain is not fallen in proportion

to the low price of wheat; but I feel convinced that it must come down to the prices in these calculations, should the average price of wheat be five shillings per bushel for two years from this time, December, 1835.

In the above statement, the whole amount of value of the produce of each farm is calculated; and therefore, if the occupiers consume in their families, corn or meat, or corn by any other horses than one to ride to market, or cart horses, the value of such corn or meat must be considered as part of their incomes; which, according to my calculations, will be on poor clay farms, (with my lowest valuation of produce,) not more than sufficient to feed, and plainly clothe, their families, or to give their children a better, if so good an education, as all charity children now have. The occupiers of good turrip, or good grazing land, need not despair of getting, with industry and good management, and good judgment of stock, a comfortable maintenance; for the demand for grain and meat must ever continue, both of which they can produce at less expense than the occupiers of poor land.

The produce of a poor clay arable land farm, and the profit of the stock kept upon it, ought to amount to seven rents, as thus:—one for the landlord; four and a quarter expenses; and one and three quarters for the tenant's maintenance. On a poor sand farm, where the expenses are less, six and a quarter will do. On fair clay land, four and a quarter: one landlord; two and a quarter expenses; one tenant. On good turnip land, three and a half: one landlord; one and three quarters expenses; three quarters tenant. There is a difference of opinion as to the size that farms ought to be: most, who consider the question as it regards the public interest, are against large farms; believing that there is not a proportionably equal number of labourers kept on large farms, as there is on moderate sized ones; besides which, it is argued that two farmers' families might be maintained where there is only one. Perhaps there are not, on the generality of farms of five hundred acres, double the number of labourers employed as there are on farms of two hundred and fifty acres. As the question regards landlords and tenants, the size of farms must depend on the nature of the soils, the parts of the country in which the farms are situated, and the competency of the tenants; for landlords cannot be expected to let large farms to tenants with small capital.

Some years ago, a talented, but over-zealous advocate, injured the agricultural cause, by proposing that there should be a duty of forty shillings per quarter on the importation of foreign wheat; this certainly was a most unreasonable proposition. I was, from the first, quite satisfied with the present scale of duties, although I felt sure it was a protection against importation, to fifty six shillings per quarter only, instead of sixty, as it was intended to be.

Taking into consideration the large supplies that must come from Ireland, even if the condition of the lower orders should be so improved that they shall consume double the quantity of wheat they now do; for whilst their condition is improving, they will so improve the cultivation of the land, as greatly to increase its produce; the increased supply from the effective draining of the fens of this country; the lessening the demand for wheat from the labourer's allotment system, which has increased the consumption of potatoes in labourers' families, and decreased the consumption of bread: under all these circumstances, without there should be in some year a general failure of the crop, or the country be involved in war, or until there is a very great increase

of the population, the average price of wheat in this country must be low, and consequently low rents must be submitted to.

Low prices for agricultural produce will certainly be beneficial to some classes; but the question is, will low prices, with our high taxation, be for the general good? I think not; for the lower the value of the produce of the soil, the higher in reality it makes the amount of the national debt, and thus adds to the weight of taxation upon that class which pays so great a portion of the interest of it. If the incomes of landlords are to be so reduced by their rents being lowered to correspond with wheat at five shillings per bushel, and tenants are not able to get more than a bare subsistence, the manufacturers must find the demand for their goods very materially lessened. Whether, with such low prices of produce, and consequently such a reduced circulation of money, a sufficient amount of taxes can be raised to continue paying, for any length of time, the full amount of interest of our enormous national debt, I leave to the consideration of those who are competent to form a more correct opinion on the subject than I am.

I attended the great agricultural meeting in London on the 15th December 1835, where, as I expected, I heard nothing satisfactory how agriculture could be relieved by any legislative enactments.

Some newspapers are continually giving statements of the comparative prices of wheat in England and on the continent. It is not the price of food in any country that proves whether it is cheap or dear, the proof is the relative value which the wages of the labouring classes bear to it. The prosperity of a country, the contentment, comfort and happiness of its labouring classes, is not to be estimated by the low price of food.

For twenty years have I continually, in different publications, been soliciting the Government to take off the burthen from the occupiers of land from duty on the turnpike roads; to reduce county rates, and to do away with the law of settlement by servitude; this having been done, and a general amendment of the poor laws, all the relief which the legislature can now give to the present agricultural distress, is, to enact laws for a commutation, or, if practical, a redemption of tithes; to establish poor laws in Ireland; and when the finances of the country will admit of it, to take off the duty on malt, but to lay an additional duty on distillation, to prevent Gin from being cheaper than it is at present. Could these things be done, rents might be lowered to correspond with wheat at six shillings per bushel, and farmers might be able to get a fair maintenance; but not at five, for situated as this country is, labour, and other expenses, cannot be reduced in proportion to such low price of wheat.

Agriculture would be benefited if landowners would live more in the country instead of living and spending the chief part of their incomes in our overgrown metropolis, or fashionable watering places, and if they would not fancy that every thing they want in the country, except bread and meat, must (to be good) come from London. Were there more of the Old English Gentlemen now in existence there would be more of the old English contented peasantry. And if landlords would request their tenants to take farming men and boys into their families as they formerly used, it would bring up the rising generation of the peasantry to more orderly habits, and in a very great degree prevent that great source of evil amongst them, improvident early marriages. The youth of agricultural parishes have of late years been under no control after six o'clock in the evening; consequently from an unrestricted intercourse

with the young females of the parish, the greater part of them have been obliged to marry; and thus, in the agricultural population, the chief part of the marriages of late years have not been of men and women, but of boys and girls. A very great portion of our National Debt was contracted by expenses incurred in a long war for the protection of property; it is not fair, therefore, that persons should evade paying by taxes their just share of those expenses by living and spending their incomes in a foreign country.

About eighteen months ago I printed and gave away one hundred and fifty copies of a Summary of Practical Farming. Having been requested by many persons to re-print my little work, I have made many additions to it, have sent it to the printer's, and expect that it will be at Ridgway and Sons, Piccadilly, London, the beginning of next month. Believing that the present agricultural distress will be brought under the consideration of Parliament immediately on its assembling, I have had some copies of the concluding part of my little pamphlet struck off to enclose to some Members of both Houses of Parliament, thinking it possible that it may afford them some useful information.

C. HILLYARD,

President of the Northamptonshire Farming and Grazing Society,

(Established 1819, for the encouragement of good ploughing, good shepherding, and for the general good conduct of farming labourers.)

*Thorpelands, near Northampton, Jan. 1836.*

## UPTON'S STEAM PLOUGH AND LOCOMOTIVE CARRIAGE.

This Steam Plough is worked by Upton's Patent Lever Steam Engine, and his Air Furnace Boiler. If a single-shared plough, the space occupied by the entire machine will be four feet by ten feet; if for trench ploughing the dimensions will be the same; if for ploughing two, three, or more parallel furrows at once, then the breadth and length will be about five feet by twelve feet.

The work done by the trenching plough will be equal to any spade husbandry; and that by the parallel shares will be found very superior to any horse ploughing; inasmuch as the ground will not be trodden and rammed down by horses' feet; and as the steerer, or ploughman, &c. will ride on the machine, the land will be left as open and light as possible, and resemble that of garden culture. To the steam plough, a harrow, drill, and seed box, can be attached when requisite, and the entire operation performed at once going, when it is for the last ploughing, without trampling the soil.

The spots left in the angles of the field by Upton's Steam Plough will be smaller than by any horse plough, as the steam plough will turn, if a single share, in thrice the breadth and length of a common wheelbarrow; and if a three shared plough, it will turn in the space of a small one-horse cart. The simplicity of construction, and small number of parts composing this steam engine and boiler, and the great safety and security of the latter, will prevent the necessity of frequent or expensive repairs, as the only parts of the apparatus most liable to wear and tear are the plough-shares, the soles, coulter, and harrow tines, which will only require the same repairs as if drawn by horses.

The engine and its boiler are calculated to last a considerable time before any repairs could be wanted, unless from accident or unfair usage; and whenever from long use, very much worn, if the boiler were to burst, it could only extinguish its own fire without injury to any person close to it.

The plough will require one steady man to direct or steer it, and a tractable boy to attend the fire and turn the steam off and on occasionally, the engine being of the most simple and efficient construction. The water tank will require replenishing now and then, and perhaps fuel will be required two or three times in the course of the day, and the boiler is admirably constructed for burning either wood, peat, or coke; or coal may be used.

The single plough is calculated to do two acres per day, and as the person will not be fatigued by walking over the rough ground, nor have any horses to rub down and feed after coming home from the field, they could remain out a longer time.

The double plough would do four acres, and the three-shared plough would do about six acres per day. The counter, or trench plough, would do about two acres per day; but as it would be equal in power to the double shared plough, it would require the same quantity of fuel and expense.

The land cultivated by this plough would doubtless be found from its efficiency to produce crops nearly, if not quite, equal to spade husbandry, and it would in such case pay for the steamer the first season.

As to the expense there would be required one good steady ploughman, who never ought to receive less than 2s 6d per day; and a tractable boy or lad, as fireman, at 1s per day, as under:—

	s d
One Man, per day...	2 6
„ Boy, do.....	1 0
	3 6

If coke is used as fuel, the single plough would require about 12 bushels per day, which at 6d, the London price, is... 6 0

Ploughing two acres per day, at 4s 9d is.. 9 6

Now it will appear manifest, that if two acres can be ploughed per day, with a single shared plough, for 9s 6d, six acres per day could be ploughed at a cheaper rate in proportion, inasmuch as there would only be the same number of people employed as before:—

Thus, Wages per day, as before.....	3 6
Fuel do do 3s per acre.....	18 0
	21 6

Ploughing six acres per day, at 3s 7d is £1 1 6

As the ground would not be trodden and rammed by horses or men in the various operations of ploughing, harrowing, sowing, &c. there can be no doubt that superior crops would be obtained; and in some soils deep ploughing is very beneficial, which could be done by steam better than by horses, for steam never tires; and as for treading the ground, it is generally very detrimental; for it is frequently observed, that in some soils, where ever a horse's foot hole is left, corn seldom thrives so well, and in many instances in retentive land and cold seasons, perishes.

The expense of ploughing with horses may be considered as under, assuming the average team of 3 horses:—

Cost per day.....	5 0
One Ploughman, per day.....	2 6
One Driver.....	1 0
	8 6
Total cost for one acre.....	8 6
By Steam.....	3 7

Difference per acre by steam, and better work done..... 4 11

The locomotive engine is so contrived, that the ploughs can be detached from it, and sent away to the fold yard, where a common dung cart ready loaded may be taken by it to the field. The steerer may then tilt this cart in the usual manner, and draw out as much manure to form one or as many heaps as he pleases, or tip and shoot the residue, or the whole load at once, if required. The steersman can then take back the empty cart at a quick pace, and fetch another loaded one if wanted.

With regard to the expense of hauling manure:—Suppose the average distance is one-third of a mile out and one-third of a mile back, and that the time taken up in tipping the load and exchanging carts would be equal to one-third of a mile more, making one mile in time and distance per load. Now as some teams do regularly twenty miles of ground per day, when hauling on the road, and twenty loads per acre are used by many at a dressing, it would amount to twenty loads or one acre per day, at only two miles per hour, average time for one team, therefore say—

	s d
Team per day.....	5 0
One man to drive and tip... 2 6	2 6

By horses per day, per acre. 7 6

The steam engine, if the ground be not very hilly, would go at four miles per hour, or forty loads per day, which at the same per day for man, boy, and fuel, comes to 9s 6d, the half of which is, per acre, as before shown, 4s 9d.

The locomotive engine would take the carts &c. loaded with produce to market, at four miles or more per hour; and might be so modified by further improvements as to be made subservient to many of the farmer's wants. It might, perhaps, be available for the cutting of roots and fodder for stall-fed, and other cattle; for threshing, winnowing, grinding corn, and pumping water, &c. &c.

In case of the last ploughing, when it is intended to sow and harrow in the seed at once going, the same power would effect the whole work, only requiring the aid of the boy, who must otherwise be engaged in driving the harrow horses, but which horse labour, and horse injury done to the soil would be done away with, and a further saving per acre effected by the steamer.

The additional boy at the steam harrow would be required to lift up the harrow occasionally, and take up the weeds, and put them in a basket hung to the machine, until arrived at the headland where a spare cart might be placed to receive them, and which the engine would take out of the field every evening, or as many times per day as necessary. As to the quantity and quality of work which such a steam engine would do when compared with animal power; assume a regular breadth for the furrow slice of eight inches, and from four to nine inches deep, according to the tenacity and stony qualities of the soil. At the above breadth, but at less depth, a horse plough would make as many bouts per acre as would amount to twelve miles and a half, exclusive of ridgings and balks. The steamer would go twice as fast, and being

more easily managed and controlled than horses, would not be so liable to get out of line, and would, I think, do the work better; besides not having the fatigue of walking.

Some idea of the saving to be effected by Upton's steam plough may be obtained by the following calculation for a farm of 200 acres:—

	s.	d.	£	s.	d.
200 acres per ann. once over			per		
at .....	3	7	acre	35	16
150 ditto and harrowing again					
2nd time .....	3	7	..	26	17
150 acres, and harrowing and seeding again, 3rd time ...	3	7	..	26	17
50 acres fallow, 3rd time ...	3	7	..	8	19
60 do. hauling manure.....	4	9	..	14	5
60 days ditto to market .....	6	10	..	20	10
30 days harvesting (long days)	10	0	..	15	0
90 half days, equal to 45 days, cutting fodder, &c.....	4	8	..	10	10

Cost for ploughing alone about  
15s 10½d per acre ..... £158 15 10

Now to compare this with horse ploughing, 200 acres, all arable land, would require ten horses for tillage, with four men and two boys per annum, if the land is to be well worked and kept going, besides other hands for occasional work.

	£	s.	d.	£	s.	d.
Therefore 10 horses kept at 20d. per day each, is per annum .....	304	3	4			
Ditto wear and tear of harness and shoeing per annum .....	45	16	8			

Four good men and two boys, as before ..... 218 8 0

By Upton's steamer, the expense of tilling 200 acres would be as before stated..... 158 15 10

To which may be added one additional man and a boy, all the year round, at same wages as before .. 57 5 0

And one pair of oxen, for furrowing, ridging, and carthing-up, and sundry other purposes, at 20s. per week the pair..... 52 0 0

Saving in the tillage of 200 acres of arable land, per annum..... } 300 7 2

Say purchase of 10 horses, for 200 acres arable land £ at £25 each....	250	Purchase of one of Upton's Locomotive steam ploughs, with 2 shares	
Do. for harness, plough-gearing, and for ploughs, harrows, &c....	100		
	£350		£350

It was stated by Dr. Parry, at Bath, that England alone contains 29,000,000 of acres of cultivated land; and for the sake of showing how steam would benefit the agriculturist, by placing him on a

par with the manufacturer, it may not be unreasonable to assume that 20,000,000 of acres are now under cultivation by the plough; and apportioning 20 acres of arable land as the labour of each horse, with the accompanying number of attendants the following calculation exhibits nearly the exact difference between horse and steam ploughing:—

20,000,000 acres ploughed by horses, at £568 8s for 200 acres, will be about £2 16s 10d per acre, or, in round numbers.....	£56,833,333
Deduct for variation of soil and circumstances, one-third .....	18,944,441

Total cost by horse-ploughing 20,000,000 acres, averaging about 37s 11d per acre ..... £37,888,889

The same ploughed by steam, at £268 0s 10d for 200 acres, will be about £1 6s 9½d per acre, without any abatement for variation as above, or for 20,000,000 acres, in round numbers, is .. 26,791,266

Total saving on 20,000,000 of acres by steam ploughing, at least..... £11,097,223

N. B.—Price of two-share plough, £350; price of three-share ditto, £450.

### TO FARMERS AND THEIR LANDLORDS.

For the *Shrewsbury Chronicle*.

MR. EDITOR,—Allow me through the medium of your paper to offer a few hints for the consideration of the committee of the Shrewsbury Agricultural Association, and the respectable body of farmers in this county. At recent meetings much was said on the causes of agricultural distress—much altercation took place as to its origin—and many remedies were suggested; but after all their talk, the force of the poet's lamentation is felt—

“Truth would they teach to save a sinking land,  
All shun, none aid you, and few understand.”

Now, farmers, you well know it is proverbial, that “actions speak louder than words.” I am about to suggest to you something to be done. Methinks in times like these, every likely means ought to be used to save those who cultivate the land from utter ruin; and I cannot help thinking that the plan I shall propose will, if carried into execution, have a beneficial effect on the agricultural interest generally.

Should not endeavours be made to establish a periodical show of Live Stock, Implements, Ploughing Matches, &c. in this county? The meetings for the above purposes may be connected with the Agricultural Association now formed, or be independent of it, as may be deemed expedient. It will be said, of what use can be Agricultural Shows to relieve the farmer? In reply, I say, they will exert a beneficial influence on the farming interests—

First—By encouraging improvements. If the breeds of Cattle were improved, and the land better cultivated, the farmer would have superior stock to bring to market, and obtain larger crops and of better

quality. It is well known GOOD ARTICLES will command purchasers, even in bad times.

Second—By rousing a spirit of emulation among the agriculturists. There is nothing like *stimulus* in furthering improvement in any art or science.

I am aware a great deal of prejudice exists in the minds of farmers, generally, as to any new plan or system; and that they are too fondly attached to the modes of farming practised by their fathers and grandfathers. But it is becoming pretty well known, OLD FASHIONED FARMING WILL NOT PAY PRESENT RENTS. Nothing, in my humble opinion, would tend so much to remove prejudice as periodical meetings, when farmers would assemble, and have an opportunity of seeing with their eyes, what they would not believe from hearsay. Here a knowledge of each other's plans may be obtained; and means which have been successful to their respective ends ought to be communicated. I recollect when the Shropshire Agricultural Show was discontinued, that it was said to be an exhibition that opened the gentlemen's eyes too much; but as I am not aware of any particular secret in farming, my deliberate conviction is (and I speak advisedly) that the gentlemen's eyes need opening YET still more. Those landlords who farm a portion of their own estate, are the most ready to meet the exigencies of the times; and others who have pursued farming for amusement or speculation, are giving up their farms, finding it to be a losing concern. At an agricultural meeting a short time since, Lord Stanley is reported to have said, "that farmers must look for the relief of the agricultural interest to their landlords, and not to anything that can be done in parliament."

Farmers! if this be true, it becomes you to look to yourselves. Let your mottos be, "Temperance, Industry, and Economy," and use every means *direct* and *indirect*, that are likely to influence Agricultural prosperity. Should this letter be responded to, and the proposed plan approved, I intend to elicit the attention of landlords and gentlemen to the subject. I have thought it best to address the farmers first, in the hope of ascertaining their feelings with regard to the measure. The landlords have professed themselves willing to assist you, and I believe their professions to be sincere, and I have no doubt, the gentlemen of Shropshire will come forward to raise a fund when the objects are fully considered. I beg to apologise, Mr. Editor, for trespassing so far on your columns, and remain,

Your obedient servant,

A WELL-WISHER TO THE FARMER.

January 11.

The *Journal du Commerce* gives a curious table of the increase of the consumption of sugar during the last few years.

	Colonial Sugar.	Beet root Sugar.	Total.
1828	61,255,232 ..	4,000,000 ..	65,255,232
1831	67,542,792 ..	10,000,000 ..	77,542,792

The average annual consumption by the French colonies of articles imported into them from France is calculated at about 50,000,000*of.*, divided as follows:—Wines and liquors, 6,000,000*of.*; oils, 2,400,000*of.*; jewellery, 500,000*of.*; paper in a variety of shapes, 500,000*of.*; pottery and glass, 500,000*of.*; skins in a variety of shapes, 2,500,000*of.*; iron ware, 1,600,000*of.*; cotton, thread, silk, woollen, and felt manufactures, 20,000,000*of.*; grain and flour, 3,000,000*of.*; and miscellaneous articles, 13,000,000*of.*—*Galvani's Messenger.*

## PALSY IN CATTLE.

LECTURE BY MR. YOUATT.

(From the *Veterinarian.*)

If, gentlemen, you should hereafter practise on the diseases of cattle as I imagine and hope is your intention, you will meet with plenty of cases of palsy: few or none of them however, will be referrible to any cerebral influence or cause, and I am not aware that the records of veterinary medicine will afford one case of hemiplegia in these animals. You will not be surprised at this, when you recollect the distinction which I endeavoured to draw, in the last lecture, between the prevalent causes of hemiplegia and paraplegia—palsy of one side and one extremity of the frame—or, in other words, disease of one or both of the motor columns: the first produced by some change in the structure or functions of the brain—the latter referrible to injury of the spinal chord.

WHY NOT HEMIPLEGIA IN CATTLE?—Comparing the average weight of the ox with that of the horse, the brain of the former is not more than one-half so large as that of the latter; but the medulla oblongata of the former is larger than this origin of the spinal chord in the latter, and the relative increase of bulk in the ox is, agreeably to the destiny of that animal, made up of evidently greater development of the lateral portions of the superior (posterior) superficies of the part—that portion of it which is devoted to the involuntary and never-ceasing movements of organic life. If we next proceed to compare the spinal chord of these two animals, we shall find that the breadth of that of the ox is somewhat smaller than in the horse; and that the difference consists in the lesser development of the motor columns on the inferior (anterior) superficies of the chord. If, then, in the horse, comparatively few cases of hemiplegia occur, we can readily imagine that they will be rarer still, or perhaps altogether absent in the ox.

THE DIFFERENT CAUSES OF PALSY IN THE OX.—The ox is comparatively little affected by the usual exciting causes of palsy in the horse. Neither the rapid nor the violent exertions of the muscular system are required from him, to which the horse is often doomed; and from mechanical injuries arising from falls or cruel blows, he is in a manner exempt; but he is liable to the influence of other causes, and of one more than all the rest,—too frequent exposure to cold and moisture.

SYMPTOMS.—I will suppose you to be hereafter settled in a low, marshy, woody country. Early in the spring, and late in the autumn, and at every sudden and considerable change of temperature, you will have palsy prevailing among the cattle in your neighbourhood. Sometimes the attack will be mild, and the progress of the disease slow. The animal will cease to feed—he will bow piteously—he will stand with his back hinged—he will stagger as he walks—he will almost drag his feet behind him, or the pastern will be flexed forward; it will bend to the ground, and the animal will walk upon it. The weakness will gradually increase during a day or two—he will struggle against the complaint as long as he can—the weakness will be referrible to the hind legs principally or altogether—it will shift from leg to leg, until at length he will fall, utterly unable to rise again.

At other times the attack will be more sudden; it will be so especially with milch cows that have been hosed in the winter and turned out too early in the spring. It is scarcely credible what mischief one cold sleety night will effect. The cows are

left, perhaps, apparently quite unaffected—at all events with nothing very serious the matter with them; and on the next morning five or six of them will be found *chilled*, palsied, and will continue helpless during several weeks. I knew one that did not get up for more than two months: she lay on her belly with her hind legs stretched out behind her, and had we not confined her, she would have sadly excoriated herself by travelling about the cow house in this position. She got up at last, very much emaciated; and being brought as soon as possible into tolerable plight, she was sold.

When they are once down, it is impossible to calculate how long they will bear up against the debilitating influence of the disease. The appetite will return—it will become as good as ever; and these miserable animals will drag themselves along many a yard on their chest and belly in search of food. There is a case upon record, in which a cow was cruelly kept in this state eighteen months. They become, as you may suppose, sadly excoriated; but they are much more so if they are slung; and he who is acquainted with cattle well knows that by this constant pressure on the abdomen—the elasticity of the belly which supports the enormous and heavy paunch being no longer called in to play—inflammation of the rumen will occasionally be produced, and the animal will perish sooner than it otherwise would do.

#### CONNEXION BETWEEN RHEUMATISM AND PALSY.

—But was not this rheumatism—lumbago? Very probably it was, in the first instance at least, for there is an intimate connexion between these diseases in cattle, and some other of our domesticated animals. I do not profess satisfactorily to account for this; I am merely stating the fact. The disease is often primarily rheumatism—inflammation of some of the joints; and that is necessarily connected with a great deal of pain, and lameness as the consequence of pain. To this rapidly succeeds structural derangement; the ligaments become thickened and rigid—the bursæ are loaded with a glairy fluid—the periosteum becomes thickened, and the perichondrium too, and the whole joint, is enlarged. It is still rheumatism essentially, of the stifle, the hip joint, or the lumbar vertebrae; but palsy soon associates itself with or succeeds to the complaint, and loss of nervous power follows the difficulty or pain of moving. If the limb is but little used, or can be but little used, the supply of nervous influence is gradually lessened. This is agreeable to an invariable law of nature, that the supply of vital energy is proportionate to the demand for it; it may be increased, or it will rapidly diminish, according to the changing circumstances of the part.

**DIFFERENCE BETWEEN THE CAUSES OF PALSY IN THE HORSE AND IN CATTLE.**—You have then gentlemen, a useful lesson here. Palsy in the horse was traced to injury or inflammation of the spinal chord, or certain portions of it, and that injury or inflammation producing congestion or disorganization. Palsy in cattle is generally attributable to such causes as weaken or destroy the irritability or the energy of the nervous system—the direct influence of cold and wet upon the spinal chord—or the propagation of the chilling debilitating effect from the fibrils distributed over the surface of the body to the centre of the nervous power—or the lessened demand of power, from the inability to flex and to use the limbs in consequence of rheumatism or other affections of the joints. You will see, then, the importance of these inquiries into comparative pathology: they

will provide you with interesting facts on which your practice may be securely based, and guard you against the false analogies by which you might otherwise be led astray. We shall have sufficient proof of this as we go on.

**FURTHER DESCRIPTION OF PALSY IN CATTLE.**—There are two periods in the life of the cow when she is more than usually subject to these paralytic attacks, and when they are, most of all, severe and likely to be fatal. The poor beast, not strong in health, is left in some exposed part of the farm until within a few days of her expected time of calving, or, perhaps, she is not taken in at all. The pains of labour come upon her—the cold blast blows over her, and she is in that state of excitation and yet of general debility which accompanies parturition. She becomes suddenly palsied—at least the parts nearest to those concerned in parturition yield to the ungenial influence to which they are exposed. I will not say that the uterus loses its power, but the animal is unable to assist its contractions by any voluntary effort; and the progress of the labour is delayed, completely arrested, and the calf or the mother, or both, are sacrificed.

Again:—she has got through her calving, but she experiences that relaxation and debility to which, to a greater or less degree, our artificial treatment has subjected our domesticated animals, and, in this state, she is left quite exposed to the pitiless blast; or she is not so well taken care of as she should be, or she has been suffered before her time of parturition, to attain a dangerous state of condition and plethora, and she too becomes suddenly palsied—“she drops after calving.” She has altogether lost the use of her hind extremities; and there she lies for ten days or a fortnight, before our remedial treatment restores to her the power of moving, or there perhaps she lies never to rise again.

Dr. Powell relates a case of palsy in the human being, which well illustrates the usual character of the same disease in cattle. “A watchman on quitting his duty after a night of severe cold, was attacked by sudden and violent general pains in his limbs, which soon departed, and left him in a state of universal palsy of the muscles of voluntary motion. He had lost all command over the muscles of his limbs or trunk. His circulation was not affected in any cognizable degree, and his mind retained its usual powers. All proper remedies were tried, but he died.”

**PALSY IN CALVES.**—Calves, if they are turned out too soon at weaning time, and young stock generally, if thoughtlessly and cruelly exposed to the inclemency of the weather, are very subject to palsy. It begins with gradual loss of appetite; stiffness of the limbs; difficulty of walking; pain at every motion, expressed by plaintive lowings; trembling of the loins and hind legs; tenderness of the loins, the animals shrinking under the least pressure on the part; at length (unless they have been removed to some comfortable shelter, and otherwise properly attended to) they fall totally helpless, or they drag their hind limbs along, and rapidly pine away and die.

**CAUSES CONTINUED. TAIL SLIP.**—Some singular causes of this disease have been assigned, and among the rest that supposed origin of almost every ailment of cattle, *tail soaked*, or *tail slip*. Professor Dick, of Edinburgh, has given a very humorous account of this. “Is there loss of appetite, of flesh, or of strength?—The tail is examined, and the disease is pronounced to be the

tail slip: is the animal hide-bound?—it is the effect of the tail slip: or has paralysis of the extremities commenced?—it is produced by the tail slip. The disease soon passes along the cow's tail to the back, and the animal loses the use of its legs."

The tail of the ox, like that of other animals, was given to him partly or principally as a defence against the attacks of the insects by which he is annoyed. It is formed like a common whip. The bones become gradually smaller towards the tip of the tail; at their termination is found a soft space, and beyond this a firm cartilaginous portion to which are attached the long hairs by means of which the flies are driven away. The bones are the handle of the whip, the soft part is the connecting medium between the handle and the thong, and the cartilaginous portion with the hairs form the lash. The country people or the country practitioners, unable to comprehend this, are frightened at the soft place which they find, and imagine that a portion of the tail has slipped from its natural situation, and that some great mischief must ensue, and, generally, loss of power in the whole spine.

**STAGNATION.**—Mr. Knowles gives a more scientific and erudite account of the matter. He calls this disease "The Crook," and says that it begins at the heart. "The heart is the cistern of the bloodvessels, and the blood being thrown too fast from the cavity of the heart into the arteries, and the arteries throwing it too fast into the veins, they become overloaded; then, when a coldness is brought on the whole frame, by cold dry winds, this disease comes on, by which the whole body is disordered, one vessel forcing another, till a stagnation is brought on." What measures these gentlemen adopt in order to remove the evil we will presently inquire; but it is time to proceed to the lesions which are found after death.

**POST-MORTEM APPEARANCES.**—We have more opportunity of observing the lesions after death in these animals than in the horse. They are mostly slaughtered while they may be of some use to the butcher, rather than left to die; but we must not say what always becomes of those to whom the disease and not the knife puts an end. There is usually inflammation both of the membranes of the spinal chord, and of the chord itself about the dorsal-lumbar, the lumbar and the sacral regions. In lingering cases I have seen decided thickening of the membranes—they have been studded with tubercles—hard concretions have been found upon them, and at some point or other the membranes of the chord have been considerably dilated, the substance of the chord has been softened. In the cow that was paralytic eighteen months the spinal marrow belonging to the four last dorsal vertebra and the whole of the lumbar ones was softened; it was mixed with bloody decomposed matter, and surrounded by a thick yellow serosity.

Generally the affection is confined to the motor surface. The difference between the inferior (anterior) and the superior (posterior) surfaces of the chord, and of the membranes covering those surfaces, is very remarkable. Perhaps the horizontal position of the chord in the quadruped may, in some measure, account for this. In some cases however, the whole of the chord will be similarly affected. I have often inquired of the butcher, when I could get him to put confidence in me with regard to these things, and the answer I have received has been, that he does not recollect a case in which the "pith" has not been more or less af-

ected, and sometimes he has been compelled to remove it, or a part of it, from the spine, before he could expose the meat for sale.

Occasionally there is much infiltration of the muscles of the loins and thighs, with effusion of bloody fluid into the abdomen; and occasionally there are bony enlargements of the vertebræ, or scirrhus tumours attached to them, which sufficiently account for the impairment or loss of voluntary motion.

**CONSULTATION.**—Here, gentlemen, you will not forget the kind of animal you have to do with, and the destiny of that animal. Sooner or later he must find his way to the butcher, and the profit of the master depends upon the condition in which the animal reaches that bourne. It will make but the difference of a few shillings whether the horse arrives at the knacker's yard covered with flesh and fat, or reduced almost to a skeleton, and, therefore, unless the manifest sufferings of the animal warn you to desist, you protract your attendance almost to the last moment, hoping for some favourable change which may enable you to restore your patient to his owner once more fit for his service. It is a very different matter here. If the beast is in tolerable condition, it will not much concern the owner if the final disposal of him is somewhat hastened; but if the disease, as in the present case, is one that interferes not with the wholesomeness or the saleableness of the meat, it will be of considerable consequence to the proprietor, whether the patient is at once disposed of, or kept lingering on until there is little flesh left upon its bones, and that little good for nothing. You will, therefore, most carefully examine the nature of the case and the probability of a successful termination of it.

After a few years practice you will probably be able to consult your own experience in the treatment of this disease: and I will tell you what that will be—that if the progress of the disease has been slow, and you have been enabled to combat it, while the animal can still toddle about you will generally succeed; but not so soon after the palsy has been perfectly established, and the animal has been down more than two or three days. Also after a case of sudden attack if the patient has not been down longer than this time, but not so surely afterwards. Therefore with the consent, or at the request of the owner, you will see what the medical treatment of a few days will effect; but you will not prolong it if rapid emaciation is coming on, or the character of the disease and the value of the meat appears to be changing: and one thing I am sure that you will not do—you will not brutally fracture a limb in order to conceal from the butcher or the public the true cause of the lameness.

**TREATMENT. BLEEDING.**—To a considerable degree the different character of the disease in the horse and in cattle will require a different mode of treatment. There has not been so much exposure to external injury, nor will there be so much inflammation of the spine and its membranes, exciting general fever, and thus destroying the patient: but if the attack is sudden and acute, or chronic rheumatism is degenerating into palsy, there will generally be fever to a certain extent, and there will be latent inflammation, which in order to procure a successful termination, it will be necessary to subdue: therefore *bleeding* will be generally indicated. The indications of debility must be of a decisive character in order to forbid this remedial measure. If you bleed at all, you will probably abstract the vital fluid somewhat copiously. You

will not forget the golden rule, in most cases—the altered character of the pulse must be your signal for stopping the bleeding. One bleeding can rarely do harm, and it may be productive of incalculable good: it will certainly do so if there has been effusion of blood or inflammation in the spinal cord. It may do good even if there has been serous effusion, for the absorbents may be roused to do their duty; they are the secondary depletions that wear down the strength of the patient.

**PURGING.**—The animal system of nerves can rarely be seriously affected without the organic ones speedily sympathizing. There is not a more constant accompaniment of paralysis in the quadruped than constipation, and even more so in cattle than in the horse. It is exceedingly difficult to remove, and until it is removed there will not be the slightest remission of any of the symptoms. It is a remark confirmed by every day's observation, that the return of the natural action of the bowels is the first symptom, and the almost certain pledge, of returning health. Still I should be loth to administer any acrid purgative. A pound of Epsom salts, with half an ounce of ginger, should be administered after the bleeding, and with the important precaution of pouring it, by means of a long-necked bottle, or Read's patent syringe, slowly down the throat, in order that it may not acquire sufficient momentum to break through the floor of the œsophagean canal, and fall into the rumen and be lost. Smaller doses consisting of half a pound of Epsom salts and four ounces of sulphur, should after this be administered once every six hours until the bowels are opened; and the purgative effect should be for a while kept up by a repetition of the sulphur.

**AROMATICS WITH THE PURGATIVE.**—I have recommended a large dose of the aromatic with the purgative—no less than half an ounce of the powdered ginger—the best aromatic and tonic that can be administered to cattle, and here peculiarly applicable from its influence on the muscular coat of the intestines, while the power of the purgative is, perhaps, principally exhausted on the mouths of the excretory ducts, while the impulse of the aromatic is often speedily diffused over other and distant parts of the frame. In addition to this is the fact, that when the medicine from being carelessly administered, has for a while, been lost in the rumen, that half insensible viscous has at length been roused to action by the aromatic and its contents, in an unusual and unnatural way, have been propelled through the maniplus and into the abomasum, and so purgation has at length been established, and the animal saved.

I am glad that, with a little difference in the minutæ of practice, I am corroborated here by the opinion of my friend Mr. Sewell, of Brighton. He refers to the sudden chills from exposure to cold. "I have found," said he, "they laboured under great prostration of strength, with constipated bowels and fever; my practice was to give opening medicine, with, in the intervals between the physic, cordials to stimulate the stomach and induce the animal to feed, as there appeared great indifference to take food. Thick gruel was frequently given with the horn with ginger and aniseed combined. From what I have seen of cattle under disease, I think they require and will do better with cordial than the horse, when given in certain and appropriate stages of disease." These are valuable hints, and they are founded on the peculiar temperament of cattle, and the structure of

their stomachs. We should neither of us, however, go quite so far as Mr. Knowles, who gives in one dose four ounces of mithridate, two of grains of Paradise, two of flour of mustard, two of turmeric, a quart of ale, and half a pound of treacle, and all this "in order to bring heat into the small pores, and give motion to the whole of the blood vessels."

**PALSY OF THE SPHINCTERS.**—One caution, however, I would give you. I have spoken of constipation being the usual accompaniment of palsy, and the removal of that constipation the signal of the commencement of recovery: if, however, at the first attack, or during the progress of the disease, the sphincter of the rectum or the bladder should become paralyzed, and the fœces or the urine, or both, should be discharged involuntarily, the chances of recovery will be so materially lessened, that it will become your duty to advise your employer to have the patient slaughtered without delay, and while her carcass may be of any value.

You will cause a sufficient quantity of warm gruel to be frequently offered to your patient, and to be forced upon her if she will not voluntarily drink it. You will likewise cause injections of warm gruel to be frequently administered, in each of which a few ounces of Epsom salts have been dissolved, and to which a little ginger has been added. They may be useful, but from the peculiar construction of the lower and larger intestines in cattle, they cannot be so generally or so extensively serviceable as in the horse.

**APERIENTS (continued).**—Well, gentlemen, you have bled, and you have physicked, and you are continuing to stimulate the mucous coat of the intestines by the exhibition of sulphur combined with an aromatic. You will do this with much propriety during the whole course of the disease; you will possibly promote the absorption of any effused fluid either in the cerebral or spinal mass; and you will keep up a gentle and manageable counter-irritation, which cannot fail of being, to a certain degree, useful; and the action which you are exciting and keeping up in the muscular fibre of the intestines and absorbents may contribute to or prepare the way for the return of healthy action to other parts. Sulphur in cattle is like castor oil in the human being, its employment will generally be beneficial, and rarely and almost never prejudicial.

**DERIVATIVES.**—Palsy in cattle is in many instances connected with, or consequent on, or still essentially identified with rheumatism. This indicates a course of treatment which I cannot say would be altogether useless, but which would be much less efficient in the horse. Can we stimulate extensively and safely any other tissue or system? The integumental at once presents itself: it is extensive enough, and a sympathy seems to exist between it and every other system. Can we increase the insensible perspiration? If we can, we are combating the disease with powerful weapons. We are calling into action a derivative which in extent and degree of influence is unequalled. Is there any diaphoretic as it regards cattle? I believe that there is, and one on which considerable dependence may be placed. The white antimonial powder (I so designate it in distinction from the black sulphuret of antimony so much used in horse-practice,) the pulvis antimoniæ of the human practitioner, I do regard as a valuable diaphoretic in cattle:—I have generally used it in combination with opium and ginger. I have, or fancied that I have, both soothed and

roused my patient—I have lessened the morbid irritation and the pain which existed in the spinal chord or its membranes, or the muscles nearest the affected part—I have accomplished this by the influence of the sedative, while by increasing the energy of the capillary vessels of the skin, I have given an outward direction to the mischief, and have disposed the parts and the system generally to return to a state of healthy action.

**WARMTH, CLOTHING.**—There is one auxiliary here, without whose co-operation all other appliances would be powerless, and of whose influence, and almost of whose name we seem to be in a manner ignorant in the greater part of our practice on all our quadruped patients—I mean *Comfort*. I am as ardent an advocate for proper ventilation as any one can be; I want no close confined cow-house or stable, or kennel; no stationary empoisoned atmosphere: but I do want, and I demand for our patients, comfort; a comfortable habitation, a comfortable bed, comfortable clothing, and comfortable food; and from the peculiar temperament of cattle, I particularly demand it for them. I believe that, with the exception of the rot in sheep, more than half the losses of the farmer are attributable, directly or indirectly, to a neglect of this. The palsied cow—place her if it be possible on a somewhat inclined surface that her urine and her fæces may be as little as possible sources of annoyance; bed her up warmly; cloth her warmly; supply her with warm gruel; give her, but not in too great quantities, the food she likes best; turn her once or twice in the day; admit the external air in sufficient quantity to carry away every unpleasant or unwholesome effluvia, but suffer no current to blow upon her: thus you will adopt the best means to insure the effect of your internal remedies.

**EXTERNAL APPLICATIONS.**—Little dependence can be placed on most, perhaps I may more properly say on any of these, except in the early and curable stage of the disease; and then they must be thoroughly rubbed in, or they will not penetrate through the thick skin of the ox; and many a hearty rubbing with a brush or a wisp of straw, must take place over the whole of the lumbar region. Turpentine and hartshorn, and tincture of cantharides, must form the basis of your liniments. From setons I have never derived service: blisters have seldom risen well. A mustard poultice has done more good than either of them: but that on which the chief dependence is to be placed is a charge, covering completely the loins, containing the full proportion of cantharides, and from its adhesive quality continuing, for many a week, gentle and constant stimulous and warmth, and much mechanical support to the part.

**STRYCHNINE.**—The *nux vomica* and the essential principle of it have been celebrated for their power in the cure of palsy.

We should expect much from them, and especially from the strychnine; for it seems to be a point established by experiments on animals, that it exerts its especial and principal influence on the spinal marrow, acting as a stimulous: and when it has produced death, effecting it by means of inflammation and congestion of the spinal chord. Now, in affections like palsy in cattle, which would appear to proceed oftener than otherwise from the debilitating effects of cold suddenly or too habitually applied, this would be the medicine to which, probably, we should first and with the greatest confidence resort. Our continental brethren have done so, and they were successful. I will give you

the first recorded case of it: this is but common justice to M. Taiche:—

**SUCCESSFUL CASE OF THE USE OF STRYCHNINE.**—“On the 22nd of October, 1824,” says he, “a working ox lay down several times while at work, and was with considerable difficulty induced to get up again.

“On the 23d, the difficulty of rising was still greater, and he was left at home.

“On the 25th he was unable to rise.”

“On the 26th I was requested to see him. He was five years old, and of moderate size and condition. He was lying down, and it was impossible to raise him; his skin had a dry harsh feeling, and stuck to the ribs; his loins, of the ordinary temperature, were tender when pressed upon; his hind limbs retained their natural sensibility and feeling, but the power of moving them was in a manner gone. The other functions did not seem to be affected. No fracture or dislocation of the spine could be detected after the most careful examination. Three drachms of the spirit of sal ammoniac (*lipor ammoniac*) were administered, and a stimulating liniment was ordered to be rubbed into the loins. This was repeated on the 27th and 28th.

“On the 28th he was raised with great difficulty; he supported himself for a little while on his fetlocks, and when he was forced to move he went on his fetlocks. He presently fell down, and made some ineffectual attempts to rise again. The same treatment was pursued.

“*Nov. 2d.*—He was nearly in the same state. I then prepared a decoction of seven drachms of the *nux vomica*, boiled in a quart of water, and administered it to the animal.

“*3d.*—Nine drachms were given in the same way. He got up twice in the course of the day, and staggered a pace or two.

“*4th.*—He lifted himself on his hind limbs, his fore ones appearing to be weaker than ever.

“*6th.*—The countenance and appetite were good; the pulse was weak and slow; the general temperature moderate, and the sensibility of the skin natural: he made few efforts to get up but lay quietly on his litter.

“*8th.*—He got up without assistance several times, but he found that he could not walk, and quietly lay down again.

“*10th.*—He could walk a few steps, and was evidently improving.

“*15th.*—He was apparently well. I advised that he should be fattened and sold as soon as possible. He did fatten quickly and satisfactorily, and was driven to Paris.”

**UNSUCCESSFUL ONES.**—This case was imposing, and yet marvellous. Two doses only of the medicine were given, but they were enormous ones, and what we should have thought would have destroyed the patient at once.

I had a case of palsy in a cow some little time afterwards. I bled her and purged her, and then gave a decoction of six drachms of *nux vomica*. I gave it with some degree of fear and trembling, although I had read, in Orfila, that the same quantity had been given to a goat without inconvenience. It had no effect on the cow. On the next day but one I repeated the dose; that had no effect; it neither alleviated nor increased a single symptom; and the animal died two days afterwards.

I had another opportunity afterwards of putting the power of the *nux vomica* to the test. I gave three successive doses, on alternate days of an ounce

of the nut, but likewise without effect. We have not many of these cases in the vicinity of the metropolis, and therefore I have had no chance since of putting the power of the *strychnine* to the trial; and I do not know that I should attempt it had I the opportunity, unless, after a fair confession of the truth, I had the full permission of my employer, or he would sell me the animal at such a price as I could afford to give. We want some experimental farm, with a veterinary school attached to it, where these experiments, and many others on the diseases that destroy so many valuable animals, might be fully and fairly made. The private individual can scarcely be expected to consent that his property should be risked in this way; and the practitioner would not be justified in thus risking it without the consent of the owner.

**THE CURE OF TAIL-SLIP.**—I promised to tell you what means of cure were adopted by the believers in *tail-slip*. The lower part of the tail has slipped out of its place; there has been great derangement of the parts, and the mischief is extending over the whole of the spine. Well, what is done? "Why," says Professor Dick, "they cut off the cow's tail, to be sure, and thus get rid at once of the disease and the cause of it. Some, however, less cruel or more scientific, make an incision into the under surface, allow the wound to bleed freely, and then bind up the part, filling the wound with a mixture of tar and salt. But does not this often effect a cure? Why, the stimulus of the knife and the salt and the tar are no trifling matters; and if only a little is wrong with the animal, the cow at once springs upon her feet; or if much blood is allowed to escape, relief is given, as it would have been by blood drawn from any other part."

I cannot help admiring how profoundly Mr. Parkinson treats this disease. "If you take hold of the tail and turn it upwards, the end will drop down, or with your fingers you may perceive a separation of the bone. The remedy is, to cut a piece off the tail end, and let it bleed. Farriers open the tail and put in some kind of salve through ignorance, and by way of making a bill; there being no necessity for this, as I have made a cure by cutting the tail only: but ever since I have discovered the great efficacy of *chamber-lie*, in all cases I have given that, for it is a security against any farther complaint."

Well, but neither the operation nor the chamber-lie are always effectual. The extremity of the tail has not only slipped out of its place, but the animal is *bewitched*. Why, then a small piece of the rowan-tree is bound round the tail, and the cow is got up and held up by main strength; and a black cat is procured and made to pass three times round the cow's body, over her back, and under her belly. The cat mews and scratches might and main; and after having sufficiently mauled the poor patient, and frightened her out of her wits, and out of the disease too, contrives to make its escape, carrying away every ailment, real and imaginary.

Gentlemen, I will not detain you longer with this nonsense.

**REDUCTION OF BURTHENS NO RELIEF TO THE TENANT.**—It appears from a letter addressed to the Editor of the *Bucks Gazette* of Saturday last that a person of the name of Jones stated at the late meeting of the Bucks Agricultural Society that in consequence of the reduction in the poor-rate, effected by the New Law, a *certain* landlord

in a *certain* village in that county has raised his rents. We commend this to the notice of Mr. Cayley, who said a short time since, that "if prices were raised, landlords would not be so wicked as to increase their rents."

#### TO THE EDITOR OF THE MAIDSTONE GAZETTE.

Sir,—In reading your valuable paper, I was much gratified in seeing that T. Rider Esq., had deducted 20 per cent. from his tithes in Boughton, which already were exceedingly low. If you deem a striking contrast worthy a space in your next, I will furnish it. The Rev. Isaac Mossop, rector of the poor parish of Smarden, advanced his tithes for the last year, 10 per cent., and demands a further advance of 20 per cent. for the present year, whereas our late rector, at different times, deducted 25 per cent., making a difference of 55 per cent. The parish, of course, respectfully declined to comply with his ungracious demand; and the Rev. Gentleman is now taking his tenth of milk, &c. I should like to ask, Sir, which is most likely to pull the church down!

I am, Sir, your obedient servant,  
Smarden, Jan. 14, 1836. AN OLD TITHES PAYER.

#### BIRMINGHAM, 1st MONTH, 27th.

In taking a review of the Corn Trade for the past year, it will be observed that the progressive decrease in the value of Wheat (which we noticed at the end of 1834, as a remarkable feature of the preceding four years,) continued to the close of 1835, the average for December, 1834, being 41s 1d, but for the same month in 1835 only 36s 5d. From 1830 they stand as follows:—1830, 66s 6d; 1831, 61s 3d; 1832, 55s 2d; 1833, 48s 5d; 1834, 41s 1d; 1835, 36s 5d. The last is considerably below the general average of France for the seventeen years terminating with 1835, which was 40s 6d, the lowest during the period being 33s 8d for the past year, while ours is far lower than it has been for half a century, notwithstanding the general admission that the last year's crop in England does not exceed an average, whilst in Ireland it was decidedly deficient; indeed, the almost universal accounts appear to indicate that the surplus growth of that country this season (beyond what is required for their own consumption), will be but small,—an impression that derives confirmation from the inconsiderable import of Irish Wheat since harvest: the same remarks apply in some degree to Scotland, where the greater portion of the grain was secured in bad condition; and an expectation prevails in both countries, that their principal cities will require an importation from England, before another harvest. The additional consumption, consequent on the increase of population, the relatively low price of Wheat compared with other grain, and the general trade of the country being in a state of prosperity, must be great. The English grower has for the last four or five years, been almost wholly protected from foreign competition, yet the price in London is 8s per quarter lower than in New York. This state of things affords a striking illustration, not only of the inefficiency of a selfish attempt at monopoly, in conferring benefit on its promoters, but that it increases to them the evils intended to be remedied, at the same time inflicting incalculable loss and injury on the rest of the community.

We have to note a decided improvement in our rates the last few weeks,—say 6d per bushel, our present prices being,—for good English, 5s 4d to 5s 10d; Irish, 4s 10d to 5s per 62 lbs at Birming-

J. & C. STURGE, CORN-FACTORS.

## ECONOMIZING FOOD FOR HORSES.

(From the Irish Farmer's Magazine.)

It is a most mistaken notion that horses, kept for laborious purposes, can only be supported in strength and condition by corn and hay—for the result of many experiments has proved otherwise. The late Mr Curwen, the Irish tourist and eminent agriculturist, fed his horses chiefly on steamed potatoes, and cut straw also steamed, mixed together, and given warm. No doubt, this root is more nutritious when prepared in this manner; but it certainly is too windy and bloating without the addition of hay and corn. Many farmers in Scotland steam all sorts of food given to horses, and find it economical, notwithstanding the expense of fire and extra labour, which is a strong fact in favour of the system. Oats are steamed also to make them more nutritious; but, except in cases of sickness of the animal, or not being able to masticate hard grain, the practice is not advisable. It is necessary to keep horses for labour in good working condition, and too much soft food, be it ever so nutritious, will not effect this object. As a remedy also, to bring unhealthy and poor horses into flesh, steamed food is admirable; but to keep them so, and to enable them to pay for their keep, corn and hay, in its natural state, is necessary.

There are, however, many roots and vegetables besides potatoes which, if given in proper proportions, will be found both beneficial and economical in feeding horses; viz.:—Swedish turnips, carrots, parsnips, and mangel wurtzel, all of which may be given washed and sliced. The tops of French furze bruised, and a small proportion of oats added, is extremely strengthening to these animals, and will make their skins sleek and healthy. The last year's shoots are used for this purpose, which may be passed through the straw-cutter, and cut very small; then mixed with corn, which will induce the horses to masticate all altogether. Horses that have been badly treated and hard worked will not recover their condition without the assistance of some green vegetable or steamed food, even should they be served with sufficient corn and hay, and these to keep them so are occasionally necessary. Straw or red clover cut should be always given with corn; but there is a difference of opinion whether oats should be broken before being mixed with the chaff. Beans certainly should, otherwise these animals would suffer much injury, both in their eyes and teeth, in masticating such hard food; but it is said, and we think justly, that chaff being mixed with the oats is sufficient to prevent the horses from swallowing the latter too quickly, and that a certain degree of mastication is necessary, in order to promote the gastric juices so necessary for digestion.

We consider Swedes by far the cheapest food for horses, and, although not quite so valuable for the purpose as carrots, yet the facility for raising the former crop, and their moderate cost, makes them generally preferable. Potatoes, if steamed, are a more nutritious food, but, if given raw, are by no means so, and in this state often cause cholick and other internal complaints; and it even appears that the water from boiled potatoes is injurious to horses—besides, Swedes can be raised at two-thirds less expense than potatoes, taking the extra quantity of produce of the former, and their less expense of culture into consideration. The chaff from wheat after winnowing is good food for horses, mixed with sliced roots or with corn; and it may be generally observed that chaff, either of hay or straw, is necessary when on dry food, to promote the health of those useful animals; and, if on green roots, to counteract any bad consequences from too much succulent food.

Peas or vetches are not good food for horses, but may be given in small quantities with advantage, if broken, with Swedes or carrots. In a green state, however, vetches are the best horse food yet discovered, provided it is given when it has formed the blossom and not let to ripen its seed—it is, therefore, necessary that crops should succeed each other, that a continuation of this valuable food may be obtained. When horses are soiled it is better they should be housed at night in an airy stable, for the grass they pick up in the early part of the spring will do them but little service, and the pasture much injury, and some hay occasionally will materially benefit them. If at severe work, some oats or beans will likewise be necessary. Red clover should not be given to horses till in full blossom, and by soiling them with it one acre will feed more than two would do by permitting it to be pastured; the valuable manure made under this system is also a matter of the utmost importance to the farmer. B.

## ON RECLAIMING WASTE LAND.

BY MR. WILLIAM AITON, HAMILTON.

(From the Quarterly Journal of Agriculture.)

Having always considered agriculture to be the most important branch of industry in which a nation can be engaged, in so far as to raise from its own soil a due supply of food for its own population, I have often endeavoured to draw attention to the subject, by detailing what seemed to me best calculated to promote the interest of that science. It is for that purpose I now try, through the medium of this Journal, to call attention to what seems to me one of the most interesting branches of husbandry which is far from being yet duly attended to, namely, the general melioration of the soil, and in particular the reclaiming of a still greater portion of waste land, so as to render the nation independent of foreign states for the supply of grain, roots, and dairy produce, which every person conversant in rural matters, or in true political economy, must see to be a matter of primary importance. Every man will, no doubt, pursue the line of business that he thinks best calculated to secure his own interest in the circumstances in which he is placed, without much regard to national prosperity; but when any branch of national industry of such importance as the raising of grain from the soil is overlooked, the government ought to take measures to protect, encourage, or even to enforce, due attention to the raising of every possible species of food at home, to all the extent of national supply.

I am aware that speculative economists have recommended not only the neglect of waste land, but proposed that the cultivation and cropping of all land of an inferior or medium quality should be abandoned, and such land turned into pasture; and that we should trust to foreign markets for such grain as we may need, beyond what can be raised from land of the best quality. But a moment's reflection may serve to convince every man that is not led astray by whim or party feelings, that an advice so absurd as that offered by these economists, was never given by men of sound minds; for if their directions on that subject were to be acted upon, some hundreds of thousands of the most industrious and virtuous of our farmers, with their children, servants, and others whom they employ, and who are depending on the cultivation and cropping of inferior land, would

all be thrown out of their present employment, and have their courses in life to commence anew; and where, I would ask, could these people find employment or subsistence? not in the cotton factories nor on the loom, for these are already overstocked with hands; and no poor-rates that could be raised could keep so many people alive, or carry them over the Atlantic.

Every person capable of ordinary reflection must see, that if the cultivation and cropping of inferior land, and that of a medium quality (which comprehend more than two-third parts of all the arable land,) were to be abandoned, *that* land could be occupied with nothing but a sheep stock, or with cows of the worst description. Dairy cows, or those of an improved breed, and horses, cannot be supported without fodder in winter and spring; and that cannot be raised from such land, unless it is manured and cropped as at present. We might get a precarious supply of grain from the Baltic, and some butter and cheese from Holland, but we could not procure milk without keeping a dairy stock. We could not grow potatoes without dung, or have dung without straw, or straw without cultivating and cropping the land. If the land in question were turned into sheep-walks, a shepherd and his dog might manage all the land that now gives employment and support to thirty or forty families; while the herbage would, after seven years or so, decline in value, and ultimately be covered with moss, which would reduce the rent so as to ruin the proprietors, and of course deprive the manufacturer and merchant of their best and surest customers. In a word, the abandonment of inferior lands seems to me to savour more of bedlam, than even the ravings of the late Mr. Cobbett against the use of potatoes, which exposed him to so much ridicule.

The clamour raised by the economists, and so loudly reiterated by town and village demagogues, against the corn-laws, so necessary to protect agriculture, and induce the farmers to improve the soil, displays great ignorance and want of patriotism; for it is very uncertain if we could find anywhere grain to the extent we would need if their advice were followed. But if we could procure the grain, the price, which has always been paid in specie, or bills on London, would soon drain the precious metals from Britain, and place her in the mercy of foreign states, not only as to price, but they might enact something like the Berlin and Milan decrees, or Jonathan's non-intercourse act, and thereby compel us, in the hour of necessity, to sell our birthright and best interests for a mess of pottage.

That we may easily raise, to great advantage, from our own soil, all the grain, roots, &c. necessary for even a greatly increased population, must be evident to every one who has paid due attention to that subject; and which I shall endeavour to shew in a few short paragraphs.

It has been ascertained, by parliamentary inquiries, that on an average of twenty years, the grain raised from our own soil has fallen short of national supply, to the extent of *four weeks consumption* every year; or, in other words, our grain falls short one-thirteenth part of what is required to supply the population. But if we could so improve the soil as to make it yield one quarter in addition to every twelve quarters now raised, we would become independent of the foreign market for all the necessaries of life, that our soil and climate are capable of producing. And surely no man at all conversant in husbandry can doubt,

that it would be easy to raise far more than would supply that deficiency.

Every person who has reached the age of fifty years, and that has paid the least attention to the progress of agriculture, will admit, that the produce of land has been far more than doubled within that period; and every intelligent farmer will also admit, that our arable land is capable of producing double its present produce in the course of twenty years. If so, we certainly err greatly in purchasing, in a foreign market, any part of the grain we need.

But besides what might be raised to advantage from the land now under cultivation, it is well known that we have in Britain and Ireland several millions of acres of waste land that are capable of being rendered profitably productive of much grain, roots, and rich herbage, but which are still neglected. I need not point out such land, as it abounds in almost every rural district in the three kingdoms. It is therefore surprising that when we have such treasures in every county, and so many people complaining for want of employment, and going to America to find it, that we should allow our waste land to remain *in statu quo*, and send our money to foreign markets for the grain such land would produce, and the cultivation of which would give bread to many people, mend the climate, and enrich the proprietors. A reasonable attention to this subject would more become our legislators, than the party squabbles they have been so much engaged in for some years past.

Fortunately the possibility of reclaiming waste land to advantage, is no longer merely a matter of opinion, but has in many instances been carried into effect with profit. I could easily point out many instances of successful cultivation of such land, but shall at present only mention a few cases of spirited exertions, that I have lately witnessed on the borders of the counties of Peebles and Lanark, where the land is from 700 to 800 feet of altitude, and from whence coal and lime are rather distant.

A very spirited and well-arranged improvement of waste land has been begun on the muirish part of the farm of South Slipperfield, in the parish of West-Linton, by Mr. William Forbes, advocate, under the direction of Mr. Alexander Goldie, W. S., Edinburgh. The land there selected for improvement extends to 1000 acres, which had been till now occupied as a sheep-walk, and into which neither spade nor plough had ever entered. The native soil is dry and sandy, but covered with a thin stratum of moss, and which is deeper where the ground is level and moisture detained: the whole yielding much heath and coarse herbage, but mostly so smooth on the surface, and the acclivity so moderate, as easily to admit of being ploughed. This muir has been laid off into five farms, of about 150 acres each, with two cottage settlements of about 10 acres each; and above 150 acres have been formed into broad belts of planting between the farms, and these well inclosed with substantial stone-fences. Four excellent and suitable steadings and a cottage have been built on the four farms already let, and excellent roads have been made to each. The proprietor makes subdivision fences when required, on the tenants laying down the stones, and pays the price at the kiln of 25 bolls of lime to each acre of the land. The tenants pay no rent for the first three years of their leases, and only the interest of the proprietor's outlay on the farm (say 1*l.* or 2*0*l.** each) for the fourth and fifth years; and a rent which may

average about 7s 6d per acre, from that to the end of the leases of nineteen years. But each tenant is bound to break up and crop ten acres every year, till he go over the whole land he occupies. Three of the tenants and the cottager, who are only in the first year of their respective leases, have each a few acres in crop; and where they had limed the land, and given it two ploughings, their oats are medium crops, of six or seven bolls per acre; but where the land was not limed and twice ploughed, the seed sown will not be reaped. One tenant had obtained leave from his predecessor to lime, plough, and sow two acres the spring previous to his entry, and his first crop on these two acres yielded him 12 bolls of oatmeal; and his crop of this year, now reaping (16th September 1833,) extends to eighteen acres, one-half of which will average six bolls, and the other half nine or ten bolls per acre. All these tenants have excellent crops of potatoes and turnips. One of the five farms is retained by the proprietor.

As the highest rent offered for the whole 1000 acres, to be occupied as a store-farm, was only 80*l.* per annum; as all the improvements executed by the proprietor will not cost more than 2000*l.*; and as the whole land will (if rates do not vary from what they are now) yield from 10s to 15s per acre of rent, after the expiry of the present leases, besides 200 acres of planting, the improvement cannot fail to be profitable; while the reflection of having turned a desert into a fruitful field, ornamented a district, and improved its climate, given employment to many people at first, and to several families permanently, must yield the learned proprietor lasting satisfaction.

Another interesting improvement was a few years ago made by the late Sir Charles Lockhart of Lee, and Mr. Charles Cunningham of Newholm, near Dunsyre, which falls to be described. The water of Medwyn, having a very irregular course through an extensive haugh, had rendered it a marsh so much overflowed with water in winter, that it was of very little value, and some places of it could not be gone through with safety. But by opening a proper channel for the water for nearly four miles, the whole haugh has been, or can now, by making a few side-cuts, be rendered dry, and capable of being cultivated with ease, and to great advantage. Some of the occupiers of part of that haugh have not, it is true, from their leases being near an end, proceeded in bringing part of the haugh into crop. But Mr. Cunningham has brought his part of it (about forty acres) into a state of complete improvement, and rendered it productive of the very best of all sorts of grain crops, roots, and grass. And Mr. Hamilton in Boreland has, during this and last year, broke up about fifty acres of the same haugh, and it has yielded him luxuriant returns of oats. He is preparing to break up twenty acres more next year; and some other tenants are beginning to follow his example. The haugh altogether extends to between three and four hundred acres; and what has already been cropped, has yielded ten times the produce it did formerly.

Mr. John Allan Woddrop of Ellsrickle has, on his estate of Garvald, in the parish of Linton, converted several fields of marshy land into dry ground, from which he is reaping crops of oats, barley, hay, potatoes, and turnip, all of the best quality.

Mr. Daniel Brown, one of Mr. Woddrop's tenants, has, within the last five years, broken up about sixty acres of waste land, part of which had

been formerly cropped, but had since been allowed to become wild, and part of it is new land, and he has reaped excellent crops of grain and roots from every part of what he has broken up.

Mr. William Bowie, in a new farm in that neighbourhood, the property of Mr. Richard Mackenzie of Dolphinton, has begun to break up some fields of waste land, from which he is reaping valuable crops. Some others of Mr. Mackenzie's tenants have improved, and are now improving, patches of waste land, which has amply repaid their labour, as well as ornamented and enriched that estate.

Mr. David Brown, in Easton of Dunsyre, is now reaping an excellent crop of oats from about forty acres of waste land, that had either never come under the plough, or that had been neglected for about fifty years, and had become waste, yielding little but heath.

These spirited and generally successful improvements, all situated near to each other, and near to the extensive improvements on the estate of Sir Thomas Carmichael of Skirling, those of Mr. William Aitchison of Boreland, and others, afford altogether an agreeable specimen of the culture of waste land, which, if persevered in as begun, will soon render large tracts of bleak and poor lands productive of the food of man, and ornaments of the district in which they are situated, as well as serve to stimulate other proprietors of such waste lands to fulfil a duty to themselves and to the nation, by turning deserts into productive soil.

## TIMBER.

The following observations are extracted from a work lately published by Mr. Smeaton, civil engineer, entitled "The Builder's Pocket Manual":—

**FELLING TIMBER.**—Something may be done towards the prevention of decay, by felling the timber at a proper season. A tree may be felled too soon or too late, in relation to its age, and to the period of the year. A tree may be so young that no part of it shall have the proper degree of hardness, and even its heart wood may be no better than sap wood, or a tree may be felled when it is so old, that the wood, if not decayed, may become brittle, losing all the elasticity of maturity. The timber grower is more likely to adopt, from interested motives, the former of these errors, and fell his timber too young. His object is to obtain as much timber as possible, but a tree is not in its maturity when it ceases to grow, for after this period its fibres gain firmness and density. The time required to bring the several kinds of trees to maturity varies according to the nature of the tree and the situation in which it may be growing. Authors differ a century as to the age at which oak should be felled, some say 100 and others 200 years, it must then be regulated according to circumstances.

But it is necessary to say that the timber trees should be felled at a proper season of the year, that is to say, when their vessels are least loaded with those juices which are ready for the production of sapwood and foliage. The timber of a tree felled in spring, or in autumn, would be especially liable to decay; for it would contain the element of decomposition. Midsummer and midwinter are the proper times for cutting, as the vegetative powers are then expended.

There are some trees, the bark of which is valuable, as well as the timber, and as the best time for felling is not the best for stripping the bark, it is customary to perform these labours at different pe-

rieds. The oak bark for instance is generally taken off in early spring, and the timber is felled as soon as the foliage is dead, and this method is found to be highly advantageous to the durability of the timber. The sapwood is hardened, and all the available vegetable juices expended in the production of foliage. Could this plan be adopted with other trees, it would be desirable, but the barks are not sufficiently valuable to pay the expense of stripping.

SEASONING TIMBER.—As soon as the timber is felled it should be removed to some dry place, and being piled in such a manner as to admit a circulation of air, remain in log for some time, as it has the tendency to prevent warping. The next process is to cut the timber into scantlings, and to place those upright in some dry situation, where there is a good current of air, avoiding the direct rays of the sun. The more gradually the process of seasoning is carried on, the better will be the wood for all the purposes of building. Mr. Tredgold says, "it is well known to chymists that slow drying will render many bodies less easy to dissolve, while rapid drying, on the contrary, renders the same bodies more soluble. Besides all wood in drying loses a portion of its carbon, and the more in proportion as the temperature is higher. There is in wood that has been properly seasoned, a toughness, an elasticity, which is not to be found in rapidly dried wood. This is an evident proof that firm cohesion does not take place when the moisture is dissipated in a high heat. Also seasoning by heat alone, produces a hard crust on the surface, which will scarcely permit the moisture to evaporate from the internal part, and is very injurious to the wood. For the general purposes of carpentry, timber should not be used in less than two years after it is felled, and this is the least time that ought to be allowed for seasoning. For joiner's work it requires four years, unless other methods be used, but for carpentry natural seasoning should have the preference, unless the pressure of the air be removed."

WASTE LANDS.

Subjoined will be found a statement of the quantity of waste lands, or uncultivated soil, which still exists throughout various parts of the country. The document has been furnished to us by a society for the encouragement of industry, which meets somewhere in the City, and one of whose objects is to persuade the Government and the public that it is much better to employ the people in cultivating waste lands in England, than to send them to New South Wales or the Canadas. On this subject there are two points for consideration:—the interests of the emigrant, and the interests of the country. That the condition of the emigrant would be greatly bettered by his being set down in either of the countries alluded to, and bettered far beyond what it could be in this country, we think there can be no doubt; for in both there is every encouragement to the emigrant, while here taxation is daily grinding the faces of the poor, and extracting from them almost every penny, which the exertion of honest industry can procure for them. With regard to the interests of the country, again, the question is more doubtful, or rather becomes a selection of difficulties: for that the cultivation of waste lands is not profitable may easily be guessed from the capital of the country being diverted to different objects, while on the other hand, nothing is more self-evident than that every able-bodied man who emigrates to a foreign clime carries along with him, not only a certain portion of labour which is lost to the country, but a considerable portion of capital also, and that the

country is in consequence a loser to such extent by the transaction. Which of the losses incurred by it is the greater—that of furnishing means for the support of those who can find no work, and are in consequence unable to maintain themselves, or that which arises from the direct loss of capital and labour incurred by emigration, we leave to others to determine:—

1825.

Table of the larger Quantities of Waste Land, and Counties containing the same, in the United Kingdom; about two-thirds of which are convertible into arable, gardens, meadows, and pasture, and one-third for planting young trees; and the future procuracy of turf, peat, etc. for fuel:—

N.B. The unprofitable land in the United Kingdom, of which Scotland contains 8,523,930 acres, comprehending the surface occupied by roads of every class, lakes, rivers, canals, rivulets, brooks, &c. towns and villages, farm-yards, and all other vacant spots, as quarries, ponds, and ditches, hedges and fences of all kinds, cliffs, craggy declivities, stony places, barren spots, woods and plantations, are 15,301,994 acres.

\* The greater part of this county belongs to companies in the City of London. We trust that we shall be able to count on the aid of these bodies.

† The other counties, which we have not included in this estimate, contain, notwithstanding, in the aggregate, a very considerable quantity of waste land; and while we observe Yorkshire, Mayo, Sutherland, &c., with such gigantic proportions, let it be recollected that even the diminutive Rutland, though smallest of English counties, contains of this portion of national asset 1,000 acres!

## TITHES.

The following statement has been handed to us by a gentleman who requested its insertion, as a rare occurrence, and well worthy the general attention. The names of the parties, which are given in the original, we shall omit for obvious reasons. The writer says "You no doubt recollect that in the year 1830, the tithic composition in our parish was valued and fixed by ———— and ———— (the latter gentleman the noted parson's man.) At that time, wheat was selling at from 30s to 34s per coomb, and every one but our rector thought it was set at its full value, and it is known to be higher than any in our neighborhood of the same quality of land. What must be your surprise when I tell you that on Monday, the 7th December last, the farmers met at the ———— Inn, for the purpose of paying their money, in the great hope, if not in the great expectation of an abatement of 20 or 30 per cent. The term of valuation having expired at Michaelmas, 1834, the last year they were under no bargain. At the meeting they were told by the lawyer, (———) that he had no authority to offer any abatement, but on the contrary, they would find that the rector was not satisfied with the tithe they were now paying. The rector, though he did not choose to receive the money of the farmers themselves, came and dined with them, and when some attempted to remonstrate with him on the exorbitant tithe they were paying, he said he did not wish to interfere with the harmony of the evening by going into the subject, but would appoint a day for the purpose." Accordingly, the farmers were summoned for a particular day, each at a different hour, when the rector demanded—"now wheat is selling at the miserable and ruinous price of 18s. per coomb, an increase of from 10 to 15 per cent. (according to circumstances) upon the valuation of 1830, and not satisfied even with that, he would not agree with us for that advance, if we were disposed to give it, unless we would submit to the following scale, which he proposed." It was this:—

"If a coomb of wheat and a coomb of barley together drop to 28s. the two coombs, mind you, he would be satisfied with the present advanced tithe, and if the two coombs dropped below 26s he would then reduce 5 per cent. and if below 24s 10 per cent. and so on. But on the other hand, if the coomb of wheat and coomb of barley rose to more than 33s value, he should advance 5½ per cent. and if to more than 36s 10 per cent. and so on—the reduction to be for every 2s the two coombs may fall, and the advance to be for every 3s they may advance. So here are the major part of us larger occupiers thrown upon the casting system again. Let the sticklers for supporting the dignity of the church establishment look at this, and think whether it is not high time that the land of this nation should be relieved from such a curse as this—and a very great curse it is, that when it shall have pleased Providence to reward the industry of the producers with good crops, that the clergy should continue to be allowed by the laws of this country to tear from them the tenth of their skill, capital, and industry; throwing the labourers out of employ, to be maintained out of the poor's rate. I believe nearly every other clergyman around here has made some abatement, such as 10, 15, 20, and one 30 per cent.—*Norwich Mercury.*

## TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—In your valuable paper I read an account of the Central Agricultural Society's meeting, held at the Freemason's Tavern, Dec. 15th. I am happy to find something is going to be done to relieve the farmer. I beg leave to suggest a few plans, which I have no doubt, if put into operation, would tend materially towards it, and which is, the better cultivation of the soil; though it might not be in the power of many farmers to do it at present, but it

might be done between landlord and tenant. I am sorry to see that many farmers do not put more than one-third of the manure on their farms now, which they did a few years back, and the result will be, that in a few years we must have recourse to foreigners for corn, though plentiful at present. I have made this remark to many of the farmers, and the reply is with one and all, that they cannot afford to manure well now, the times are so bad. Where that is the case, I should say it would be better for the landlord to allow so much per acre for manure, than to let their farms be run out. There is another great error prevailing with many farmers; that is, not paying more attention to the breeding of good stock. It is often to be seen in market that one farmer sells his three-year old cattle for almost double the price that his neighbour can get for his, where the land of both farms is equally good, or would be with good management. I have always noticed that a farmer that breeds prime stock is also a good cultivator of the soil; while, on the other hand, he that is deficient in one, is so in both. There are many estates much neglected by the landlord in the way of drainage, for no land that stands in need of it can be brought into a high state of cultivation. There are many instances to be met with where one farmer is getting 35 bushels of wheat per acre, and his next neighbour only getting 15, with only the fence between the fields; and in two cases out of three, the land of the latter could be made to produce equal to the former, with proper management. There is much land to be met with, where several improvements might be made in the same field—as drainage, more manure and working the soil better, and not let it get full of couch-grass and other noxious weeds, occupying by far the greater part of the land. The grass land on many farms is more neglected than the ploughed land, from the want of drainage, manure, and letting off the surface water; and in dry soils, from want of irrigation, where it might be done with little expense. Perhaps it will be said, that every one has a right to do what he likes with his own; but my opinion is, that it is as much the landlord's duty as his interest to see that his land is made the most of, as it is his right to call on parliament for relief.

## A SHROPSHIRE FARMING SERVANT.

3rd February.

PRESERVING GRAIN.—A discovery of considerable importance has been announced with regard to preserving grain. To preserve Rye and secure it from insects and rats, nothing more is necessary than to fan it after it is thrashed, and then to stow it in the granaries mixed with chaff. In this state it has been kept more than three years without experiencing the smallest alteration, and even without the necessity of being turned to preserve it from humidity and fermentation. The experiment has not yet been made with wheat and other kinds of grain, and they may probably be preserved in chaff with equal advantage.

IMPORTANT TO BAKERS.—A mechanical kneading trough has lately been invented by a baker of the name of M. Fontaine, at Paris, for which he has obtained a patent from the French Government. The chief advantages derived from this new invention are, that from 30 to 800 pounds of dough can be kneaded in the small space of time of 15 minutes, with the labour of only one man, and that without the least fatigue. It also causes the dough to be much better kneaded, consequently the bread is much better made than by the process usually adopted. This invention is the fruit of long experience.

## AUSTRALIAN AGRICULTURAL COMPANY.

On Tuesday, the twelfth annual general meeting of the proprietors of shares in this undertaking was held at the company's house, King's Arms-yard, Coleman-street, to receive a report from the directors, and on other affairs.

John Smith, Esq., in the chair.

The Secretary read the report. It stated that the company's commissioner in Australia had reported very favourably with respect to the land granted to the company. The locations at Liverpool Plains and in Peel's River possessed every advantage which was to be met with in the colony of New South Wales for pasturage, &c. The report stated that the number of sheep on the company's lands, including fine-woolled and other descriptions, amounted to 47,270, of horses to 370, and 2,340 head of cattle. The stock of sheep on the lands consisted wholly of young, fine, improved woolled sheep. There was an increasing demand for horses for the Indian cavalry, and the company had a considerable quantity of land under cultivation, with crops of wheat, hay, maize, tobacco, &c. The colony had suffered from drought, but rains had fallen abundantly, and the crops of wheat when the last accounts left looked well. The operations at the coal-mines were going on actively, and there had been sold in the last year 8,490 tons. The sales of wool from the company's flock had realized, including six bales of skin wool, 5,350*l.* The remainder of the last clip, amounting to 156 bales, had just arrived. One circumstance, the report stated, had operated injuriously—the want of an adequate supply of convict labour. The directors had obtained the consent of Lord Glenelg to assign 150 convicts to the company, in addition to those already employed on their lands.

The Chairman, in moving the adoption of the report, said a great advantage had been obtained by the assignment of a number of convicts to the company. This was the more important as Gen. Bourke was compelled to assign convicts to those who bought lands in the colony, and the company had in consequence been left without an adequate number. It was perhaps not generally known that when convicts were allotted to individuals, and behaved well for some time, they were entitled to tickets of leave, which gave them liberty to work wherever they pleased. The supply now given by Lord Glenelg would enable the company to prosecute with vigour the works of the coal-mines and other objects. Although coal had been discovered in Van Diemen's Land, still a preference was given to that raised in Australia. The flocks and cattle on the company's land were in a healthy state at the date of the last advices.

The report was adopted, and directors and auditors were re-elected to fill those offices which had become vacant by rotation.

Thanks were returned to the governor, the deputy, and the Court of Directors and the meeting adjourned.

## THE FARMER'S CREED.

BY SIR JOHN SINCLAIR.

Let this be the farmer's creed;  
Of stock secure the choicest breed,  
In peace and plenty let them feed,  
Your land sow with the best of seed,  
Let not it dung or dressing need,  
Inclose and draw it with all speed  
And you will soon be rich indeed.

## COMMUNICATION FROM MR. WIL- LIAM BLACKER.

TO THE EDITOR OF THE IRISH FARMER'S AND  
GARDENER'S MAGAZINE.

Sir—I perceive in your article, "On Leasing and Cottage Holdings," in your present Number, (January, 1836,) you make allusion to a letter I addressed to the Editor of *The Highland Society's Journal*, and published by him in the Number for September last, from which you quote an opinion of mine (in which, however, you do not agree), "that the reduction of rents had been made with a sparing and very reluctant hand;" and you argue, from my having stated at the Markethill Dinner, "that I had often felt myself called on to stand up in defence of the landlords of the North of Ireland, and to oppose the indiscriminate abuse which the Press in England makes it almost a practice to apply, without reserve, to the landlords of Ireland generally—and which, so far as regards the principal landed proprietors of the northern parts of the kingdom, I know to be quite undeserved," &c. Now, I beg to assure you I am fully sensible of the friendly spirit of all your comments in regard to me, and therefore am quite certain your observation as to the latter statement being indicative of a change of mind, was not meant to accuse me of any *inconsistency*; but as some of your readers may take the matter up in that point of view, I beg to state that any apparent disagreement which may have struck you, between the two declarations, is most easily explained; and if you refer to my letter, or publish it entirely, for the perusal of your readers, you and they will both plainly see that the *first* declaration was applied to the landlords of the empire *generally*; and the *last* declaration was limited to the landlords of the *North of Ireland only*, and but to a *portion* of that limitation. Therefore, there is *no inconsistency whatever* in excepting any *small portion* from a *general charge*. Again, as to the correctness of the fact as regards the landlords of the empire—Will you or any other person assert, that rents have been reduced at *all equal* to the fall in price of agricultural produce? If this is not the case, (as every one must admit, speaking generally in regard to the rents of the empire,) *then* the abatements certainly cannot have been made with a *free and liberal* hand—and I cannot be much blamed for applying the epithets *sparing* and *reluctant*, if the abatement that has been made is certainly *under the mark*.

I should not wish to be led into a controversy which I really have not time for; but I think you will see, on referring to my letter, that you do not deal fairly with my statements. You assume it to be *evident* that, by increasing the number of small farms, a proportion of the working classes would be thrown out of employment. Now, the very reverse is the case. Large farms are almost exclusively worked by horses. The allowance of human labour to the hundred acres, in Scotland, is four men and a boy. Now, divide the hundred acres into twenty farms, of five acres each, and, if they go on the house-feeding system, they (the small farms) will have sufficient and well-remunerated employment for themselves, twenty in number, with their wives and families, according to the average of five to a family. No man without considerable assistance from his family, can cultivate five acres without the help of horse work. Thus, you may safely say, there is six times the quantity of human labour employed by the small farms than is employed in the large.\* I

\* From this, it appears evidently, that if the entire kingdom was divided into five acre farms, there

must further remark, that your argument, as to the state of agriculture in France—or in Kildare and Kilkenny—has no reference whatever to what I have written. In order to guard, as I thought, sufficiently against any possibility of mistake, I distinctly state in the letter alluded to—"I, however, wish it to be understood that, in arguing for the small farmer, I always suppose him to have the skill and the means to crop his land properly. If he has not these he must be supplied with both one and the other, which the plan I advocate is calculated to furnish;" and as you charge your example with both ignorance and inability, all my arguments remain untouched by your remarks. I beg to repeat that, in this reply, I merely mean to set myself right with yourself and your readers, and feel certain, if you read over my letter more particularly, you will find I am not liable to the conclusions you have drawn.

I am, Sir, yours, &c.,  
WILLIAM BLACKER.

### STATE OF AGRICULTURE.

[The subjoined article is from the last number of the *Edinburgh Review*. We are aware that it may not be approved of by all parties, but it contains so much valuable information that we do not scruple to give it.—ED. FARMER'S MAG.]

The increase of manufactures and commerce in Great Britain since 1760 has been so very extraordinary—so unprecedented in the history of industry—that it has engrossed the almost undivided attention of most inquirers into our progress in wealth and civilization. But, how paradoxical soever the assertion may at first sight appear, we are not sure that the improvement and extension of manufactures can, all things considered, be truly said to have materially exceeded the advances made in agriculture. The results of manufacturing and commercial improvement—the great towns, the factories, warehouses, docks, and other vast establishments, and the increase of population and of wealth to which they gave birth—arrest the attention of every one, and impress the mind with the most exalted ideas of their productive powers and capacities. Compared with them, the results of the most improved and skillful agriculture escape the public attention. They are spread over a wide surface; they have nothing striking or imposing about them; a crop of three quarters an acre does not appear very different from one of four quarters; and a country imperfectly cultivated, especially if it be well wooded, may

would not be anything like population to occupy them; and though you seem to assume, that I would wish spontaneously to cut up all the large farms to this extent, I am not aware that any thing I have said or done, can justify such an opinion. I have merely advocated it as a measure of necessity, to give employment where employment could not otherwise be had; and so far from wishing for it, I describe as one of the advantages which the allotment of un-reclaimed lands would occasion, would be, "that the farms instead of being subdivided, would by degrees be enlarged, and the comforts and independence of the whole community would be gradually increased by the operation of natural causes, without constraint or violence," viz: by the small holders going of themselves to the new allotments, and leaving their respective holdings to be divided among those they left behind.

seem, to a common observer, to be little inferior to, if it do not surpass, one that is cultivated in the most approved and efficient manner. It is only when we survey them in the aggregate, when we bring the scattered and singly inappreciable results of agricultural industry into a collected mass, that we become duly sensible of their magnitude and extreme importance; and that the panegyrics of the ancients on agricultural industry seem to be almost as correct as they are eloquent.

The insular situation of Great Britain, and the rigidly enforced regulations under which the trade in corn and other agricultural products has long been conducted, afford the means of establishing some most important conclusions as to the progress of agriculture. If the population has been greatly increased, if all classes be at present better and more liberally fed than at any former period, if the consumption of corn by horses be at least three or four times as great as about the middle of last century; if, we say, all these things have been accomplished, not only without any increase, but with an actual cessation of importation, is it not a clear proof that agriculture has been wonderfully improved? It may not be possible to point out the different modes in which the grand result has been brought about, or to measure the exact influence of each, but of the result itself there cannot, under the circumstances supposed, be the shadow of a doubt. We shall briefly show that such has been the case.

As to the increase of population in England and Wales, since 1700, it is exhibited in the following table, calculated by Mr. Finlaison of the National Debt Office.

Population of England and Wales, from the year 1700 to the year 1830, including the Army, Navy, and Merchant Seamen:—

Years.	Population	Years.	Population	Years.	Popula.
1700	5134516	1750	6039684	1800	9187176
1710	5066337	1760	6479730	1810	10407556
1720	5345351	1770	7227586	1820	11957565
1730	5687993	1780	7814827	1830	13840751
1740	5829705	1790	8540738		

We regret we have no similar account of the population of Scotland since 1700 to lay before the reader. Its population at the period of the Union in 1707 is generally supposed to have been about 1,050,000: but it was not till 1755 that it was estimated with sufficient accuracy. At that epoch the population was ascertained, from returns communicated from the different parishes to Dr. Wedster, to be 1,265,380. In 1801 it was found by the census of that year to be 1,599,068; and in 1831 it had increased to 2,365,114, or to nearly double its amount in 1755.

Taking the population of England and Wales in 1755 at 6,259,707 (the mean between that of 1750 and 1760), and adding to it the then population of Scotland, we get 7,525,180 for the population of Great Britain in 1755. But the population in 1831 was 16,539,318, showing that in the interval there had been added to it the prodigious number of 9,014,139 individuals, or that it had increased in the ratio of nearly 220 per cent! An increase of this sort is unparalleled in any other European country, and is to be matched only by the increase that has taken place in the United States.

Now, we affirm that the improvements that have been made in the agriculture of Great Britain since 1755 have sufficed to provide an ample supply of food for this additional *nine millions* of inhabitants;

and if we suppose, which is certainly a moderate estimate, that they consume, one with another, to the value of 8*l* a-year of raw produce, it will follow that the progress made in agriculture, since the middle of last century, has added the enormous sum of 72,000,000*l*, a-year, or more than twice the total value of the cotton manufacture, and nearly three times the interest of the national debt, to the free disposable income of the country. It will not be difficult to show that such is undoubtedly the fact.

Mr. Charles Smith, the well-informed author of the tracts on the corn trade, estimated the population of England and Wales in 1760 at six millions, which the previous statements show was very near the truth. He then estimated the consumers of each sort of grain, the quantity consumed by each individual, and, consequently, the whole consumed by man, as follows:—

Estimated Population of England and Wales,	Average consumption of each Person,	Consumed by Man.
3,750,000 consumers of wheat, at 1 quarter each,		3,750,000 quarters.
739,000 do. of barley, at 1½ do.		1,016,125 do.
888,000 do. of rye, at 1¼ do.		999,000 do.
623,000 do. of oats, at 2½ do.		1,791,225 do.
		7,556,350 do.
In addition to this, Mr. Smith estimated the wheat distilled, made into starch, &c. . . . .		90,000 do.
Barley used in Malting, &c. . . . .		3,417,000 do.
Rye for hogs, &c. . . . .		31,000 do.
Oats for horses, &c. . . . .		2,461,500 do.
Total of home consumption, . . . . .		13,555,850 do.
Add excess of exports over imports, . . . . .		398,624 do.
Add seed (one tenth), . . . . .		13,954,474 do.
Total growth of all kinds of grain in England and Wales, in 1760, . . . . .		15,349,921 do.

These estimates are believed to have come pretty near the mark; and they are interesting as showing the variations that have taken place in the food of the people. But whether accurate or not is of little importance to our argument. There is, at all events, no doubt about the fact that the average annual excess of the exports of corn over the imports, did not then amount to 400,000 quarters. This is a matter that does not depend upon estimate or conjecture of any kind; but upon the official returns rendered by the custom-house. But we have imported no foreign corn, or next to none, for the last four years; so that it necessarily follows, that all the vast numbers that have been added since 1760 to the population of Great Britain, must be exclusively indebted for their subsistence to the subsequent improvement and extension of agriculture; except in so far as we may suppose this result to be modified by the absorption of the 400,000 quarters referred to above, and by importations from Ireland.

The imports from Ireland amount at present to about 2,500,000 or 2,600,000 quarters of all sorts of

grain, from 1,600,000 to 1,800,000 quarters being oats. And, adding to the imports from Ireland the 400,000 quarters exported in 1760, the total extra supply, exclusive of that derived from the improvement of the agriculture of Great Britain, may be taken at nearly 3,000,000 quarters, of which about two-thirds are oats. Now, supposing this quantity were altogether used as food for man, it would not provide for more than 1,200,000, or at most 1,500,000 of the 9,000,000 added to our population since 1755 or 1760. In point of fact, however, not a single bushel of it can be fairly regarded as being so used. The horses at present in Great Britain, over and above those kept in 1760, certainly require at least from eight to ten, instead of three millions of quarters of corn, for their consumption: and, in addition to the vast increase of population there has been a material increase in the consumption of each individual. Hence, in measuring the progress of agriculture in Great Britain, as we have done, by the mere increase of population, we are very considerably, indeed, within the mark.

To attempt to prove by argument the fact that there has been a wonderful increase in the number of horses since 1760, is, perhaps, presuming too much on the patience of the reader. For every single horse used in posting, in stage coaches, in the conveyance of waggons, vans, &c., along the high-roads in 1760, there are now from twelve to twenty, or more. In some districts there has been a decrease in the number of horses employed in teams; but even in these the total number of horses has been much increased. In Lancashire, the West Riding of Yorkshire, and all the manufacturing districts, the increase in the number of horses has been almost as great as the increase of manufactures; and this also has been the case in London and in all the large towns. We are quite sure that we are within the mark when we say that there are at this moment in Edinburgh, Glasgow, and Dundee, upwards of *twenty-five* horses for every one that belonged to them in 1760. And the improvement in the keeping of horses has been quite as great as the increase of their number.

Mr. Charles Smith estimated the consumption of oats by horses in 1760 at 2,461,500 quarters. But no one can be so ill informed as to suppose that this estimate is in any degree applicable to the present times. On the contrary, we are well satisfied, from extensive inquiries made amongst those best informed as to such matters, that the consumption of oats by horses in Great Britain at this moment is certainly above ten if it do not exceed twelve millions of quarters. But taking it at ten millions only, it follows, that about five millions of quarters more of British corn, after allowing for the entire imports from Ireland, and for the cessation of the exports, are now appropriated to the feeding of horses than in 1760. Hence it appears that the improvement and extension of the agriculture of Great Britain since the middle of last century, independently altogether of any extrinsic supplies from Ireland or any where else, has been so very great, that besides enabling the country to appropriate an additional five, but more probably, seven millions of quarters to the feeding of horses, it supplies food for very considerably more than double its former population, and those too living in comparative ease and affluence. The history of the world may be ransacked in vain for a parallel instance of improvement in any old settled country.

But though there had not been a single bushel of corn expended on the feeding of horses in 1835 more than in 1760, nor an additional individual added to

the population, the improvement that has taken place in the interval in the style of living of all classes, would have a good deal more than sufficed to swallow up the entire imports from Ireland, and to account for the cessation of exports. The proofs of this improvement are abundantly obvious. Out of the 6,000,000 of people in England and Wales in 1760, Mr. Charles Smith tells us that 883,000 were fed on rye. But at present we are quite sure there are not 50,000 who use that species of grain. The rye eaters have universally almost been changed into wheat eaters; and except in the county of Durham, where a mixture of wheat and rye, called *maslin*, is grown, the culture of rye is almost unknown. Nearly the same may be said of the consumption of barley. In the northern counties of England, at the middle of last century, and for long after, very little wheat was used. In Cumberland, the principal families used only a small quantity about Christmas. The crust of the goose pie, with which every table of the county is then supplied, was, at the period referred to, almost uniformly made of barleymeal.\* But no such thing is now ever heard of even in the poorest houses. Almost all individuals use wheaten bread, at all times of the year. It is, in fact, the only bread ever tasted by those who live in towns and villages, and mostly, also, by those who live in the country.

It has been the same every where throughout the kingdom. In Cornwall, from thirty to forty years ago, the small farmers, with the agricultural labourers, and those employed in the mines, almost invariably used barley; but at present they do not use it to any thing like the same extent as formerly, and in many extensive districts it has been entirely abandoned.† The same thing has happened in Somersetshire, and in every other county where either barley or oats was formerly made use of. Wheat is now the all but universal bread-corn of England; and in some of the manufacturing towns, within the last few years, the use of the inferior sorts of wheaten bread has been a good deal restricted; and is rejected, indeed, by all but the very lowest and poorest classes.

But great as has been the change in the quality of the food made use of in England during the last thirty or forty years, it is inconsiderable compared with the change that has taken place, during the same period, in Scotland. At the end of the American war, no wheaten bread was to be seen in the farm-houses, country villages, and minor towns of Scotland, and but little even in the largest towns. Oat cakes and barley bannocks were then universally made use of, but, at present, the case is widely different. The upper, and also the middle and lower classes in towns and villages, use only wheaten bread; and even in farm-houses, it is very extensively consumed. It is stated in the first of the works mentioned at the head of this article, that a field of eight acres sown with wheat, in the vicinity of Edinburgh, in 1727, was reckoned so great a curiosity, that it excited the attention of the whole neighbourhood, and that numbers of persons came from a great distance to see it! Even so late as the American War, the wheat raised in the Lothians and Berwickshire did not amount to a third part of what is now grown in them; and we shall certainly be within the mark, if we affirm that the wheat culture has increased in Scotland, generally, in a *tenfold* proportion since 1730.

But the change that has taken place during the last half century, in the consumption of butcher's

meat, is still more extraordinary than that which has taken place in the consumption of corn. The quantity made use of has been wonderfully increased, and its quality signally improved. From 1740 to about 1750, the population of the metropolis fluctuated very little; amounting, during the whole of that period, to about 670,000, or 675,000. Now, during the ten years ending with 1750, there were, at an average, about 74,000 head of cattle, and about 570,000 head of sheep sold annually in Smithfield market. In 1831, the population had increased to 1,472,000, or in the ratio of about 218 per cent.; and at an average of the three years ending with 1831, 156,000 head of cattle, and 1,238,000 head of sheep, were annually sold in Smithfield; being an increase of 212 per cent. on the cattle, and of 217 per cent. on the sheep, as compared with the numbers sold in 1740-50. It consequently appears that the number of cattle and sheep consumed in London has increased, since 1740, about in the same proportion as the population. The weight of the animals has, however, a good deal more than doubled in the interval. In the earlier part of last century, the gross weight of the cattle sold at Smithfield did not, at an average, exceed 370lbs., and that of the sheep did not exceed 23lbs.: whereas, at present, the average weight of the cattle is estimated at about 800lbs., and that of the sheep at about 80lbs.‡ Hence, on the most moderate computation, it may be affirmed that the consumption of butcher's meat in the metropolis, as compared with the population, is twice as great at this moment as in 1740 or 1750.

In most other parts of the country, the increase in the consumption of butchers' meat has been even greater. In thinly peopled agricultural districts very little is consumed, but in manufacturing and commercial towns it is quite the reverse; and their vast increase during the last half century more than justifies the inference, that there has been, at least, a corresponding increase in the consumption of butcher's meat.

In this respect, too, the change in Scotland has been quite as great as that with respect to bread. So late as 1763, the slaughter of bullocks for the supply of the public markets was a thing wholly unknown even in Glasgow, though the city had then a population of nearly 30,000†. Previously to 1773, or perhaps later, it was customary in Edinburgh, Glasgow, and the principal Scotch towns, for families to purchase in November, what would now be reckoned a small, miserable, half-fed cow or ox, the salted carcass of which was the only butchers' meat they tasted throughout the year. In the smaller towns and country districts, this practice prevailed till the present century, but it is now almost everywhere abandoned. The consumption of butchers' meat in Glasgow, as compared with the population, does not at present differ materially from that of the metropolis. We do not, indeed, believe that the command of the people of any country over food and all sorts of conveniences, ever increased, in any equal period, half so rapidly as that of the people of Scotland has done since 1770.

A portion of the increased supply of butchers' meat has been derived from Ireland; but being mostly thrown on a single market, that of Liverpool, this portion appears much larger than it really is. If we estimate the imports of butchers' meat into

Great Britain from Ireland, at a tenth part of the increased quantity produced in this country since 1760, we shall not be within, but decidedly beyond the mark.

It results from the previous statements,—1st, That the population of Great Britain has been considerably more than doubled—that the prodigious number of *nine millions* of individuals have been added to it, in the interval between 1755, or 1760 and 1831. 2d, That the supplies of corn, and other raw produce obtained from Ireland, are quite insufficient to provide for the increased number of horses kept in the country at present, over and above those that were kept in 1760. 3d, That the population is now, and has been for some years past, incomparably better fed, consuming a much greater quantity of wheat bread and of butchers' meat, in proportion to its amount, than in 1760, or at any other period of our history. And, 4th, That the ports have been shut during the last four years: and that, consequently, the vast additions made to the population, and the signally improved mode of living, have both been provided for by the extension and improvement of British agriculture. There is not one of these propositions liable to either cavil or dispute—they are all bottomed upon unquestionable evidence. And, having established them, we shall now briefly enquire into the nature and influence of the more prominent of those agricultural improvements, the result of which is, in the aggregate, so astonishingly great.

1. Enclosures are, probably, entitled to rank amongst the first of these. The extent of land occupied by wastes, commons, and common fields, about the middle of last century, was surprisingly great, and was, indeed, a standing reproach to the country. So late as 1770, fully three-fourths of the surface of Bedfordshire consisted of common fields, and of common or waste land; and yet it was not, in this respect, at all in a worse condition than many other counties. Wastes and commons are not cultivated; common fields are, it is true, subjected to the plough, but property in them is so much subdivided and intermixed, that it is altogether impossible to cultivate them to any good purpose. But, since the conclusion of the treaty of Paris in 1763, a wonderful progress has been made in wiping off this stain on the rural economy of the country; and in nothing, indeed, has the progress of improvement been more remarkable than in this particular. The first enclosure act was passed in the reign of Charles II. From the Revolution to 1797, the progress was as follows:—

	Acts passed.	Acres enclosed.
Queen Anne's reign...	2	1,439
George I.....	16	17,660
George II.....	226	318,778
George III. to 1797..	1532	2,804,197

It appears from this statement, which is taken from the Report of the 'Commons Committee of 1798, on Waste Lands,' that each enclosure act that passed during that period of the reign of George III., which terminated with 1797, enclosed, at an average, 1830 acres. Now, the official returns show, that from 1798 to 1832, both inclusive, 2103 enclosure acts were passed; and supposing each to have enclosed, as before, 1834 acres, the total would amount to 3,848,490 acres; making, when added to the quantity enclosed previously to 1798, an aggregate of no less than 6,652,687 acres enclosed since the accession of George III. in 1760. But as it seems probable that the earlier acts applied to a larger extent of land than the later ones, we may, perhaps, estimate the total extent of land enclosed and subdivided

by act of Parliament, from 1760 to 1832, at 6,000,000 acres. And it may be safely affirmed that, in consequence of its enclosure, the produce of this immense extent of land has been increased at least from *eight to tenfold!*

2. The introduction of fallows between successive corn crops, was a very great improvement on the previous practice; but the substitution of green crops for fallow, on all but stiff clay lands, has been the greatest of all improvements ever made in agriculture; and has effected as great and beneficial a revolution in it as the introduction of the steam-engine and of the spinning-frame has done in manufactures. There is abundant evidence to show, that the culture of turnip, as a field crop, was carried on to some extent in several English counties in the latter part of the 17th century. But the practice spread only by very slow degrees; and it was not till its introduction into the county of Norfolk, in the reigns of George I. and George II., when it was prosecuted on a large scale by Lord Viscount Townshend and others, that its signal importance became obvious. At the period referred to, the whole northwestern part of that county, which has long been one of the best cultivated districts of the empire, consisted of mere sandy wastes, sheep-walks, and warrens, worth little or nothing. These were converted into highly-productive arable land, by enclosing, marling, and the aid of the turnip-husbandry, which is, as it were, the corner-stone of the Norfolk, or improved system of husbandry. The same practices that had produced such splendid results in Norfolk—that had made sandy wastes yield the most luxuriant crops of wheat and barley—have been gradually extended, with similar effects, to many other parts of the kingdom. The produce in corn of the light soils, in all the moderately well-cultivated districts of the empire has, in consequence, been more than trebled; at the same time that a vast supply of green-food has been obtained for the feeding of cattle and sheep, and the production of the most valuable manure.

3. But, signal as has been the improvement in arable husbandry since 1760, the improvements made in stock husbandry, or in the breeding and fattening of cattle, have been still more considerable. No efforts for this purpose seem to have been made with judgment, and proper perseverance, till after 1750, when Mr. Bakewell, of Dishley, in Leicestershire, began his career. Mr. Culley, of Northumberland, soon after entered on the same course; and the signal success by which their efforts were attended, roused a spirit of emulation in a host of others. But the rapid increase of manufactures and commerce, and, consequently, of the town population, after the Peace of Paris, in 1763, by creating a corresponding demand for butchers' meat, gave the principal stimulus to the improvements that have since been made in stock-husbandry. It is not easy to over-rate their importance. We have already seen that, at an average, the weight of cattle and sheep has been a good deal more than doubled since about 1750; so that a stock of 5,000,000 head of cattle, at present, would be more than equal to one of 10,000,000 at that epoch. But the number, as well as the weight of cattle, having been very materially increased in the interval, the supply of butchers' meat must have increased in a corresponding proportion, or been at least trebled. There has also, owing to the same cause, been a very great increase in the product of wool. The supply of the latter article, produced in England and Wales, in 1800, was estimated at about 348,000 packs, of 240lbs. each. But, owing to the increased size of

the animal, and the greater weight of the fleece, the same number of sheep that produced 384,000 packs in 1800, were estimated by the best informed wool-growers and wool-staplers, to produce 463,000 in 1830, being an increase, in the interval, of no less than 20 per cent.\* It is true that the quality of the wool has rather deteriorated, for it seems to be impossible to procure both a heavy and a fine fleece. Taking, however, the increased weight of the carcass, and the increased weight of the fleece into account, sheep are believed to be more profitable at present, than at any former period; and, for the last three or four years, they have been the most productive species of stock kept in the kingdom.

It would be curious to trace how, in husbandry, as in other things, one improvement grows out of, and is dependent on, another. The grand improvement in modern agriculture—that by which it is mainly distinguished from the old—the universal introduction and superior management of green crops, may be in no inconsiderable degree ascribed to the anxiety of the farmers to procure an abundant and suitable supply of food for their stock; the increased demand for the latter being, as already stated, occasioned by the wonderful growth of commerce and manufactures.

The superior attention paid to stock-husbandry in England may, also, it is probable, be to some extent ascribable to the circumstance of the Tithe pressing, with comparative lightness, on pasture land; whilst it falls, with its full weight, on arable land, and operates powerfully to prevent the outlay of capital upon it. But, however accounted for, there can be no doubt, that in all that belongs to the breeding and rearing of cattle, horses, sheep, and pigs, the English are, at present, superior to the Scotch, and to every other people.

It may be worth while to remark, that much injury has arisen from injudicious attempts to improve native breeds of cattle. This has generally been occasioned by prematurely endeavouring to increase their size, which is always determined by external causes, such as the climate, the quantity and species of food the animals can readily obtain, &c. It is to the immensely increased supply, and better quality of food, that the increased weight of our cattle is principally to be ascribed. An improved system of breeding would have improved the symmetry of the cattle, and increased their aptitude to fatten; but, without an increase of food it would not have materially added to their size. In point of fact, too, the latter is an inferior consideration. The grand object that the prudent agriculturist should keep steadily in view, is the obtaining of the greatest possible return for his outlay; and he will prefer that kind of stock, and that breed, of any kind, that will pay him best for the food consumed. The value to which an animal may ultimately be brought, is a subordinate consideration; the profits of breeding, as of every thing else, being determined, not by the absolute price of the produce, but by its price as compared with the expenses incurred in bringing it to market. Mr. Culley's opinion is, that 'of all animals, of whatever kind those which have the smallest, cleanest, and finest bones, are in general the best proportioned, and covered with the best and finest grained meat; I believe they are, also, the hardiest and healthiest, and most inclinable to feed;—able to bear the most fatigue, while living; and worth the most per pound, when dead.† It is certain that animals, whether too

large or too small, will gradually accommodate themselves to the size best adapted to their pastures; but while the larger animal becomes unhealthy, and degenerates in its form and valuable properties, the smaller animal increases in size, and improves in every respect.

The preceding remarks apply exclusively to England and Wales. But though the progress of agriculture there, since the middle of last century, has been exceedingly rapid, it has been slow compared to its progress in Scotland. Previously to the peace of Paris, in 1763, agriculture, almost every where in Scotland, was in the most barbarous and depressed state imaginable. There was no rotation of crops; fallows were unknown, except in one or two counties; the processes and implements were alike wretched; great numbers of cattle perished every spring; the occupiers were in extreme poverty; and famines were every now and then occurring, that sometimes laid waste extensive districts. At the beginning of last century, and for long after, lands, even in the Lothians, were uniformly divided into *infield* and *outfield*. The whole manure made on the farm was laid on the former, which was ploughed and cropped without intermission, so long, at least, as it would bear any thing. Neither turnips, clover, nor potatoes had been so much as heard of; but corn followed corn in an unbroken series. In the *Countryman's Rudiments*, written by Lord Bellhaven, and published in 1723, we are told that the infield of East Lothian, where wheat is sown, is generally divided by the tenant into four divisions, or breaks, as they call them, viz., one of wheat, one of barley, one of peas, and one of oats; so that the wheat is sown after the peas, the barley after the wheat, and the oats after the barley.† Here we have a rotation with three consecutive corn crops, and a crop of peas once every four years. As might be expected, the returns were about *three times the seed*. It is of importance too, to observe, that this trifling return, was obtained at a great comparative expense. At this period, and for about half a century after, there was no instance in Scotland of a plough being drawn by fewer than four horses. Most commonly it was wrought either by six horses, or by four horses and two oxen; and in some of the more backward districts, a still greater number of animals, sometimes as many as ten or twelve, were yoked to it. This was ascribable partly to the awkward and clumsy form of the implement itself; partly to the weakness of the cattle, their diminutive size, and the improper manner in which they were yoked; and partly, and principally perhaps, to the ignorance of the cultivators. On the whole, however, the work was at once very expensive and very ill performed; the ridges were crooked and twisted, and so much heaped up in the middle, that a great deal of land in the hollows between them was lost to any useful purpose.‡

About the middle of the century we begin to find symptoms of amendment. In Maxwell's *Practical Husbandry*, published in 1756, an improved system is laid down and inculcated. He pronounces it to be bad husbandry to take two consecutive corn crops; and he further informs us, that the best farmers in East Lothian after fallow take a crop of wheat, after the wheat, peas, then barley, and after that oats. This is still very bad; though a material improvement on the practice described by Lord Bellhaven. It shows, too, that down to 1757, neither turnips, potatoes, nor any sort of cultivated herbage, formed any part of the system even of the best far-

\* Mr. Luccock's Tables, revised by Mr. Hubbard. See the Report of 1829, on the Wool Trade.

\* Rural Recollections, p. 196.

mers in East Lothian. The famous Lord Stair is said to have been the first who introduced the turnip culture into Scotland; having raised turnips on his estate of New Liston, near Edinburgh, about the middle of last century. But Mr. William Dawson, tenant of Frogden, in Roxburghshire, has an unquestionable title to be considered as the real father of the improved Scotch husbandry. Being a farmer, and cultivating for profit only, his example had infinitely more influence over his neighbours than it would have had, had he been a landlord. He commenced raising turnips at Frogden, in 1759. They were at first sown broad-cast, but he set about drilling on a large scale in 1763, and his success stimulated others to adopt the same system. Mr. Dawson was also the first who introduced, not long after 1760, the practice of ploughing with two horses abreast without a driver; nor is it easy to exaggerate the obligations the agriculture of Scotland owes to his sagacity and enterprise.\* But even in the Lothians, the four horse plough continued in general use till about 1780; and it was not finally superseded by the two horse plough for several years after. In the other parts of the country the former kept its footing still longer than in the Lothians. Nothing contributed more to pave the way for this important revolution in the method of ploughing, than the signal improvements made upon the construction of the plough by Small, about 1770.

From the close of the American war, the progress of improvement in Scotland has been rapid beyond all previous example. This has been owing to a variety of causes, but principally to the extraordinary progress made in commerce and manufactures, since that period. In the distracted state in which Scotland was formerly placed, there could be no considerable progress; but, after the battle of Culloden had extinguished the hopes of the Jacobites, and the abolition of hereditary jurisdictions had paved the way for the introduction of a regular system of government, a spirit of industry and enterprise began to be diffused on all sides. A good many branches of trade and manufacture carried on in England were introduced into Scotland soon after the peace of 1763; and not a few of them were prosecuted with much success. Their progress was checked for a while by the American war; but after the treaty of Paris, in 1783, they acquired more than their former vigour; others were introduced, and all of them have since continued, with few, and those but transient, interruptions, to advance with a rapidity that could not previously have been supposed possible.

This unprecedented extension of manufacturing and commercial industry, occasioned a corresponding increase of wealth and population, particularly in towns and villages. Improved accommodations of all sorts began to be in universal demand; and, besides the greater quantity of the inferior sorts of food required to supply the increasing population, a novel, or at least a vastly increased market was open for wheat and butcher meat. These circumstances had the most astonishing influence over agriculture. The new, and constantly increasing markets, established at their very doors, stimulated the farmers to put forth all their energies, and to avail themselves of discoveries and practices to which they had hitherto been total strangers. In a few years the face of the country was completely changed; and its productive capacities increased in a degree that the most sanguine projector of any previous period could not have conceived possible.

The following statement of the comparative weight

of the produce annually afforded under the system of farming followed in East Lothian, as described by Lord Belhaven, and that which is now followed, is taken from a paper by Mr. Oliver of Lochend, near Edinburgh, one of the most intelligent practical farmers in the empire.

‘The mode of cropping at the former period (1723) was first, peas; second, wheat; third, barley; fourth, oats; the produce being about three seeds, but to prevent all cavil, say four seeds. This, taking the seed for each acre\* at one boll,† over a farm of 100 acres, is 400 bolls. The quantity of straw for each boll of such a crop could not exceed fifteen stones; which, on 400 bolls, gives 6000 stones, or forty-two tons, fifteen and one-fourth cwt. of straw to be consumed by the stock, and returned to the land in the shape of manure. But, upon a farm of 100 acres, cultivated as at present, viz. a fourth turnips, a fourth wheat or barley, a fourth clover or rye-grass, pastured or made into hay, and consumed on the spot, and a fourth oats or wheat, the account would stand thus:—fifty acres of wheat, barley, and oats, at eight bolls an acre, which is not above the average of the crops of the best district of East Lothian, and such only was cultivated when Lord Belhaven wrote; this, allowing, as before, fifteen stones of straw for each boll, gives 120 stones per acre, which, over fifty acres, makes in all 6000 stones of straw, being equal to the quantity produced by the whole 100 acres under the old system. Now, suppose that the twenty-five acres of clover and rye-grass are made into hay, which, however, is not the best mode, nor that usually followed, and that each acre yields 200 stones, the total quantity will be 5000 stones, or thirty-five tons, fourteen and one-tenth cwt., and add to this 500 tons turnip, being the produce of twenty-five acres at twenty tons per acre which is by no means above a fair average crop. Upon these data, the weight of the materials produced annually, as food for cattle and manure, under the old and new systems, will be as follows:—

Old System,	Straw,	6,000 st. or 42 tons	15½ cwt.
New System,	Straw,	6,000	42 15½
	Hay,	5,000	35 14 1-10th,
	Turnips,	70,000	500 —

‘Thus making the weight of materials for food and manure under the new system in round numbers 577 tons, while, under the old system, the quantity is only 42 tons, leaving a balance in favour of the new of 535 tons per annum, being more than *twelve times* the whole quantity produced under the old! Nothing more is necessary to show the superiority of the new system, in so far as keeping up the fertility of the soil is concerned; and upon this depends the progress of agriculture. As to the question of comparative profit, it would be easy to show, from unquestionable data, that the new system is as superior to the old in this respect, as it is in the supply of manure; but this must be abundantly obvious to every one who contrasts the almost imperceptible advances made in agriculture, and in the accumulation of agricultural capital, for many centuries, with the extraordinary progress during the last fifty or sixty years, or since the new system began to be introduced.’

We have thus endeavoured, first, to show, by the increase of population and otherwise, that there must have been a very extraordinary increase in the produce of the soil since 1760; and, in the second place, we have endeavoured to point out the more

\* The Scotch acre, equal to 1,261 imp. acres, is here referred to.

† An East Lothian boll of wheat is equal to near four bushels; a boll of barley to near six bushels.

\* Survey of Roxburgh, pp. 69 and 90.

prominent of the modes in which this increase has been brought about. But, before noticing the present state of agriculture, it may be right to say a few words in reference to a statement often made, though really destitute of any good foundation;—that is, that the wonderful improvements to which we have adverted, were almost wholly owing to the high prices of the late war. But these improvements began both in England and Scotland about 1755 or 1760, and they had been generally introduced, and had made a great progress, before prices sustained the smallest advance. Thus, we have already seen, that no fewer than 2,804,000 acres were enclosed in England and Wales between 1760 and 1797; that that also was the era of the great improvements made in stock husbandry by Bakewell, Culley, &c.; and that during the lapse of the same period, the culture of turnips, potatoes, clover, and artificial grasses was introduced into Scotland, four-horse ploughs discarded, and the most signal revolution effected in the rural economy of this part of the empire, of which history has preserved any account. Now, it is of the utmost importance to bear in mind, that, while all this was going on, from 1760 down to 1795, prices continued almost stationary. Thus, taking the Eton market for a standard, the price of wheat, per Winchester quarter, from 1755 to 1795, was as follows:—

At an average of the ten years, from			
1755 to 1765, wheat,	£1 19	3 $\frac{1}{4}$	per qr.
1765 to 1775, .....	2 11	3 $\frac{3}{4}$	do.
1775 to 1785, .....	2 7	8 $\frac{1}{2}$	do.
1785 to 1795, .....	2 14	3 $\frac{3}{4}$ *	do.

And had 1795, which was an extremely bad and dear year, been excepted from the average of the last decennial period, prices in it would have been as low as in the preceding. It appears, therefore, from evidence, which is beyond all question, that there was no rise of prices during the thirty years ending with 1795; and yet, during that period, above 2,200,000 individuals were added to the population, and agriculture made an astonishing progress. This would have proved conclusively, even though it had not been corroborated by the experience of the last twenty years, that an increasing price of corn is not in any respect indispensable to ensure the continued and rapid advance of agriculture. All that is required to ensure this is a regularly increasing demand for the products of the soil; and this was afforded between 1760 and 1795 by the growth of population, especially in towns and villages. It should also be remembered that, towards the middle of last century, there was, owing to the miserable state of the roads, and the difficulty of communication, a great difference in the prices of corn and other farm produce in different parts of the country. But the construction of new and comparatively smooth and level roads, canals, &c., did much to annihilate this difference in the rate of prices; and conferred on the more distant parts of the country advantages that had been hitherto engrossed by the districts in the immediate vicinity of large towns. A spirit of emulation and improvement was in consequence universally diffused; routine practices were thrown aside; and all classes began to make the most astonishing efforts to outstrip each other in the career of improvement.

It is unnecessary for our purpose to enter into any statements with respect to the causes of the high prices that prevailed during the greater part of the late war; and, particularly during the half-dozen

years ending with 1814. They no doubt gave a powerful stimulus to agriculture; its previous progress being not merely maintained, but considerably accelerated.

The heavy fall of prices that took place consequently to the opening of a renewed intercourse with the Continent in the autumn of 1814, was as sudden and severe as it was unlooked-for by most persons. In the first instance, it was productive of much distress, of the ruin of many landlords in embarrassed circumstances, and of multitudes of tenants paying money rents, calculated on the footing, that the prices that had been realized during the preceding six years would be permanent. This, however, was not the situation of the great body of the agriculturists, by whom the fall was comparatively little felt. It was indeed, supposed by many, that agriculture would certainly retrograde: that a great deal of inferior land would be thrown out of cultivation; and that, unless prices rose again to something like the war level, we should be dependent on the Continent and America for a large portion of our supplies. We question whether any individual had sagacity at the outset to foresee what has actually taken place. There is an elasticity about the industry of a great nation that enables it to recover from the rudest shocks. No inconsiderable portion—we believe we may safely say the greater part—of the wonderful progress made in manufactures and commerce since 1814, is clearly ascribable to the subsequent fall in the price of corn and other articles of food. But it is quite impossible that agriculture can be long depressed, where manufactures and commerce are flourishing; and in no very lengthened period, it began to revive. The property tax, which pressed heavily on the land, was struck off; rents were reduced; and the farmers exerted themselves to meet the new order of things by fresh efforts of skill and industry, and by proscribing useless expense. We do not pretend to say that this has been the case in all districts: but there is incontestable evidence to prove, that, taking Great Britain generally, agriculture has been astonishingly improved since 1814. How else could the extraordinary increase of population that has taken place in the interval be provided for? We shewed, in an article on the 'Report of the Agricultural Committee of 1833' (No. 118, Art 1), that there was either no increase, or none worth mentioning, in the quantity of foreign corn retained for home consumption during the ten years ending with 1830, as compared with the previous ten years; and yet the population increased during that interval from 14,391,000 to 16,539,000. Now, it is impossible that a result of this sort could have taken place without either a very great increase of agricultural produce or a striking and almost unprecedented falling off in the demand for corn. But the latter supposition is out of the question. Instead of there being any decline in the consumption, the statements previously made show, that the fact is completely the reverse; and that the consumption of wheat and butchers' meat is decidedly greater at this moment than at any former period—a result inexplicable on any other hypothesis, save that of a vast improvement having taken place between 1820 and 1830.

Still, however, the Agricultural Committee of 1833, and by far the greater number of the witnesses examined before it, laboured hard to prove that agriculture was in a depressed and declining state; that the capital applied to the soil was rapidly diminishing; and that a great diminution of supply might be confidently expected. We endeavoured to show in the article referred to, that the complaints in question

\* See Table of Prices at Eton, in M'Culloch's Com. Dict.—Art. Corn.

were certainly very much exaggerated, if not altogether unfounded. The experience of the two additional years that have since elapsed has more than verified our statements. The increase of population in Great Britain from 1800 down to 1830, has been at the rate of about 15 per cent. each ten years; or of  $1\frac{1}{2}$  per cent. per annum. A ratio of this sort is not easily changed, and there is no reason to think that it has been sensibly affected since 1830. Now,  $1\frac{1}{2}$  per cent. on a population of 16,539,000 (population of Great Britain at last census), gives an annual increase of no less than 248,000 individuals; so that it may be concluded that there are at present (Jan. 1836) about 1,200,000 persons in Great Britain more than were in it when the late census was taken; and about 500,000 more than when the Committee of 1833 framed their Report. And yet very little foreign corn was imported in 1832, whilst in 1833, 1834, and 1835, the ports were all but hermetically sealed to the foreigner. It is of importance, too, to observe, that, notwithstanding the sinister auguries of the Committee, and notwithstanding the greatly increased demand for corn, evinced by the rapid increase of population, the supply has been increased in a still greater ratio. This is evident from the decline of prices, which have sunk from 53s 3d in 1832, to less than 38s at present!

This wonderful result, so different from what was expected, is partially, no doubt, a consequence of the unusually productive harvests of the last two years; but it is ascribable, in a far greater degree to the influence of improvements, with the exception of some counties in the south and west of England, which continue in a comparatively stationary state, improvements have been every where carried on with extraordinary spirit. Among the principal of these may be specified improved drainage, a better rotation of crops, the general use of bone manure, and the opening of new channels of communication by steam boats and otherwise. Drainage lies at the bottom of almost every amelioration; and it is prosecuted to an extraordinary extent, and with surprising success. The practice of furrow draining is now widely diffused over the north and east of England; and it has been introduced, within the last half-dozen years, into this part of the country, and is carried on upon a scale that will hardly be believed by those not acquainted with the facts.—Landlords and tenants are every where availing themselves of this new discovery. Perhaps, however, Ayrshire is at present, in this respect, at the head of every county in the empire. It has a great deal of wet clayey soil, suitable for this improvement; and so well is its value understood, that many millions of drain tiles are now annually manufactured in the neighbourhood of Kilmarnock and other parts of the county, though the supply be still unequal to the demand. The Duke of Portland and some other landlords drain for their tenants on their paying an extra rent of 4s and 5s an acre; and this is said to be decidedly under the additional value given by the drainage to the land. The practice is rapidly extending in Lanarkshire, Dumfriesshire, and other Scotch counties, and has already had, and, no doubt will continue to have, an astonishing influence over their productive capacities.

A better rotation of crops is also every where in the course of being adopted. The high prices of the war tempted the farmers to sow wheat too frequently, and without proper preparation; the fertility of the soil being in consequence materially impaired in many districts. This was particularly the case in the Lothians. But this defect in the management is now nearly obviated. Clover and artificial grasses are kept longer down; barley is sometimes substituted for wheat. The

fertility of the soil is preserved; and taking even the best of the old improved land, it now produces, at an average, a larger amount of food.

But, of all the recent improvements in agriculture, the introduction and general use of bone manure is perhaps the most important. It first began to be employed on a large scale in Yorkshire and Lincolnshire: and, in the latter particularly, its influence has been all but miraculous. Most part of the Wolds of Lincolnshire, an extensive tract of country, stretching from Spilsbury north to Barton on the Humber, consisted, when Arthur Young wrote his survey of the county, of mere wastes, occupied by rabbit warrens. Could he now revisit the Wolds, he would hardly recognise a single feature of their former state. The warrens have disappeared, and in their stead we find some of the finest farms and best managed land in England. This signal improvement, though it did not begin, has been carried to its present pitch of perfection by the use of bone manure. We are informed, in the late elaborate report of the Doncaster Agricultural Association on this manure that, 'before bones were generally used with turnip seed, many thousand acres (in the wolds of Lincolnshire and Yorkshire) were annually sown for that crop without any manure whatever, from the impossibility of getting fold manure for more than a third or a fourth part of their fallows. The turnips upon such unmanured land were consequently very indifferent; and the benefit of such feeding upon their tops, for bottoms they seldom had any, was very trifling. Since the use of bones has, however, become general, the turnip crop has been in many instances *tenfold*, and in few, less than *four* or *five*-fold its former bulk. All the succeeding crops of grain and seeds have been amazingly increased; and, upon the four or five shift system, there is no doubt, the land will go on progressively improving, requiring a less quantity of bones annually, from its increased fertility and power.'

This, be it observed, is the testimony of practical men, well acquainted with all the circumstances; and it is decisive as to the extraordinary value and importance of bone manure on light chalky soils. A single farmer in the Wolds of Lincolnshire (Mr. Dawson of Withcall, near Louth), has generally about 600 acres of turnip, dressed almost entirely with bone manure. They are excellent, and furnish a vast supply of food for cattle, and of manure for other land, besides preparing and fitting the ground for bearing the most luxuriant crops of wheat and barley.\*

In Scotland, the introduction of bone manure is more recent; but here, too, it has already had a surprising influence. It is every where in fact—in the Lothians and Berwickshire, as well as in the most backward districts—working wonders. From the comparative facility with which it is conveyed to rugged hilly tracts, it enables estates to be improved and fertilised that must otherwise have remained in a state of nature. Besides large quantities of bone dust imported, bone mills are now constructed in the vicinity of every considerable town in Scotland, for the preparation of this most valuable manure.

We have previously noticed the influence of new roads, and other improved means of communication, on the progress of improvement during the first 35 years of the reign of George III. But during the last few years, there has been, in this respect, a still more astonishing change. The application of steam to navigation, has given to a voyage by sea the expedition, and almost the certainty, of mail coach travel—

\* Kennedy and Grainger on the Tenancy of Land, vol. i. p. 269.

ling, at comparatively little cost: and steam packets for the conveyance of bulky and heavy articles, as well as passengers, are now established all along the coast. The markets of London and Liverpool are thus brought, as it were, almost to the door of the occupier in the remotest districts. Formerly, it was the practice for farmers in Scotland to send up cattle and sheep half-fed to the Norfolk fairs, where they were bought by graziers to fatten for the metropolis. But this practice is already much fallen off, and will, at no distant period, be known only by report. Cattle and sheep are now fattened at home, and are sent up from the eastern ports, either alive or slaughtered, to London by steam. The advantages of this are great. The crops of turnips acquire a new and greatly increased value, and their culture is, in consequence, much extended. Nor does the cost of conveying the full-fed animal to its destination amount to a fourth-part of what it formerly took to convey the half-fed animal to Norfolk. All the ports of any consequence on the western coast of Scotland are now almost weekly visited by steamers from Liverpool; and such has been the influence of this newly opened intercourse, that we are well assured that, in the extensive tract of country stretching from Greenock round by the Mull of Galloway to the Cumberland border, to the distance of 10 or 15 miles inland, the turnip culture has been increased in a ten-fold proportion since 1820. This stimulus will, it is probable, be still farther augmented by the formation of railroads. It is clear, indeed, that contiguity to market has already become of comparatively little importance. At no distant period means will be afforded for bringing the most remote and secluded districts fairly into competition with those that are most favourably situated. The productive energies of both will, in consequence, be more fully developed; nor is it easy to conjecture what the result may be.

It is, notwithstanding, supposed by several, that if prices should decline still further, or even if they continue at their present level, production will be seriously checked. But the previous statements show that there is really nothing to warrant any such conclusion. Hitherto despite the heavy fall of prices, improvements have been prosecuted on the most stupendous scale; and the fair presumption is, speaking generally, that they will continue to be prosecuted even though prices should fall still lower. It is difficult to estimate the influence that necessity and a desire to preserve one's place in society have in making men inventive and economical; or to specify the point at which production will be contracted by a lowering of prices. In 1823 and 1824, when Upland or Bowed Georgia cotton brought in Liverpool from 6½d to 10½d per lb., many of the most intelligent persons, both in this country and in America, were firmly of opinion that the price would not indemnify the planter, and that the production of cotton would certainly decline. This notion was in fact, at the bottom of the great cotton speculation in 1825. Experience has since shown the utter groundlessness of the opinion; for though the price of cotton has not risen, except now and then, for a short time, during the interval, the exports of cotton wool from the United States, which, in 1824, amounted to 142,369,665 pounds, had increased, in 1834, to 384,717,907 pounds, exclusive of a greatly increased quantity used at home.

Of course we do not mean to say that the price may not fall so low as to check improvement; but certainly there is no evidence to show that we have already touched that point, or even come very near it. It should also be recollected that, notwithstand-

ing all that has been done, there is still a vast field for agricultural improvement in Britain. We showed in a former article (No 120, Art. 6,) that it was the opinion of practical men of the highest respectability, and intimately acquainted with the state of agriculture, that the raw produce of the island might be well nigh doubled without any greater proportional expense being incurred in its production. And any one who has ever travelled through the country, or has compared the state of the Lothians, Northumberland, Lincoln, Norfolk, and other well farmed counties, with very extensive districts in the south and west of England, and with Wales, will be satisfied that the above is anything but an exaggerated statement. It is singular, indeed, how very backward many districts are, as compared with others. In numerous counties, four and five horses and two men are still employed to do that which is better done in others by two horses and one man; and in many parts the drill husbandry can hardly be said to be introduced. This shows that we are possessed of vast capacities not yet brought into activity, and that the career of improvement may be continued for an almost indefinite period.

It is not, however, to be doubted that there is at present considerable distress amongst landlords whose estates are embarrassed, and amongst tenants holding under leases commencing when prices were higher, and whose rents have not been sufficiently reduced. But admitting all this, still the extraordinary progress of agriculture proves beyond the possibility of doubt, that, speaking generally, the capital applied to the land has not been diminished, whilst it has gained immensely in productive efficacy. The distressed classes, however, are sufficiently numerous and important to entitle their representations and petitions to the favourable consideration of Parliament; and to whatever relief may be given them consistently with a due regard to the rights and welfare of others. But this, we are afraid, will not amount to much; and we are sure that its amount will not be increased by the formation of local or general Associations. Ministers needed no such stimulus to induce them to do all in their power to benefit agriculture. But by forming Associations, and affecting to dictate to Parliament, the attention of all classes is made alive to the proceedings of the agriculturists—every thing they may propose, even though it were not really objectionable, will create suspicions in the public mind, and be exposed to a severe scrutiny; at the same time that an unfounded prejudice is excited against the whole class. This is the more to be regretted, seeing that the vast majority of the agriculturists have nothing whatever to do with these Associations. They are got up by a few jobbing individuals anxious to burrow in the snug situations they may be made to afford; and are principally patronized by embarrassed landlords, who are much more anxious to discover a mode by which they may evade payment of a part of their debts, than of alleviating what they are pleased to call the distress of the agriculturists.

The reduction or repeal of the malt tax, and the degradation of the standard, seem to be the principal measures recommended by the agricultural agitators as specifics for the distress of the farmers. But it cannot surely be necessary for us to enter into any lengthened statements to show that neither the one nor the other can be entertained by any government. The malt tax is one of the most productive and least exceptionable of our taxes. It is impossible indeed to specify any tax against which some plausible objections may not be urged; but we defy any one to show how FIVE MILLIONS a-year may be raised with

so little injury either to the agriculturists, or to any other class, as by the malt tax. The question, it will be observed, is not between the malt duty and no duty. In the present state of things it is impossible to repeal, or even materially to reduce the malt duty, without imposing some other duty in its stead; and no substitute has been, or can be pointed out, that would be so little injurious. It is said that no efficient reduction has been made in the malt tax for a very long series of years; but there is not, we take leave to say, the shadow of a foundation for any such statement. The beer tax was to all intents and purposes a malt tax; as completely so in fact as if it had been laid on malt. Now this tax, which produced annually about *three millions*, has been repealed; and, adding to it the 8s a-quarter deducted from the direct duty on malt in 1823, it may be truly affirmed that the malt duty has been reduced at least *sixty* per cent within the last few years. The duty, besides being moderate, is fair and equal. It is paid by the consumers of beer, and by none else, and no one can say that it interferes in any degree with the proceedings of the barley growers. The case is very different indeed with the duties on glass, on paper, and on various other articles. If the situation of the revenue will admit of taxes being taken off, it is clear that those ought to be selected, in preference, for repeal or modification that are most injurious to industry; and if so, the duties on glass, on paper, on timber, and a dozen more, will be repealed before any one thinks of interfering with the malt tax.

Something might have been found to say in favour of the proposed repeal or modification of the duties on malt had the price of barley been depressed, as compared with that of wheat or of any other species of grain. But every one knows that it is quite otherwise. Barley bears at present, and has borne for several years past, a higher price, relatively to wheat, than it did formerly; and is consequently, where the soil is suitable for both crops, the most advantageous. This shows that it is not injuriously affected by the duty. The barley growers have, in truth, no reason whatever to complain. If there be any class more depressed than another it is the cultivators of wheat on clayey lands. The comparatively high price of barley, and the high prices obtained for sheep and wool, of which the barley growers furnish the largest supplies, render their situation the most prosperous of any class of cultivators. And it would be preposterous to think of relieving the pressure on the wheat growers by giving a bonus, not to them, but to their more prosperous rivals.

We shall not practice on the patience of our readers by dwelling on the folly and flagitiousness of the proposal for enfeebling the standard, or, which is the same thing, for tampering with the currency. No government, that has the smallest respect for either public or private honesty, will ever give the least countenance to any such project. A degradation of the standard would, we admit, be beneficial to landlords whose estates are encumbered—but how? By enabling them, with the connivance of the state, to cheat their creditors; that is to pay a debt of 1,000l, with 750l or 500l. Any legislature which should sanction such a scandalous breach of faith, which should vitiate the measure of value—the standard relied on in all contracts—that one class of its subjects might be benefited at the expence of another, would basely betray its duty, and would deserve to be suppressed as a nuisance. It is to no purpose to say that the value of money was enhanced by the return to cash payments in 1819. That return took no person, or at least, it ought to have taken no person

by surprise. It had been declared in fifty acts of Parliaments, that cash payments were to be resumed within six months after a definitive treaty of peace. Every loan had been contracted under this condition; and the legislature might as well have declared that it was not bound to pay the interest of the debt, as that it was not bound to pay it in coin of the standard weight and purity.

It was impossible, therefore, for the legislature to have refused returning to cash payments; and, whatever may have been the influence of that measure at the time, is now matter of history, and is beyond the reach of human power to obviate or repair. Supposing that it raised the value of money, that money has been the standard during sixteen years. Nineteen out of every twenty of the existing contracts, obligations, and estimates, have been framed and entered into with reference to it; so that, whether enhanced or not at the outset, to interfere with it now would not be to repair injustice, but to commit it afresh—it would be to rob and plunder the present race of creditors, on pretence that the individuals who happened to be creditors sixteen years ago, had gained an undue advantage!

But we take leave totally to deny that the return to cash payments made any sensible addition to the value of money. If we ask where are the proofs of its having done so? we are referred to the fall that has since taken place in the price of most articles. But this is plainly no proof at all. Prices may no doubt be reduced by a rise in the value of money; but they may also be reduced by a decline in the cost of production; and we contend that this has been the sole cause of the entire fall that has taken place since the resumption of cash payments. We defy the advocates of the opposite opinion to specify a single article, either of domestic or foreign growth or manufacture, that has fallen in price since 1819, the fall of which may not be satisfactorily and completely accounted for by circumstances peculiar to its production or supply, or both, independently altogether of variations in the value of money. We unhesitatingly affirm, there is no such article. The fall that has taken place in agricultural and in colonial products, in manufactured goods, &c., is entirely ascribable to improved and cheaper methods of production; to the abolition of monopolies, the reduction of taxes, the opening of new and more abundant sources of supply, or to some such cause. Not a tittle of evidence has been or can be brought to show, that the fall of prices has been owing, even in a solitary instance, or in any degree, to a rise in the value of money. This is an opinion for which there is no foundation whatever—a phantom conjured up, that a wholesale robbery might be perpetrated, under cover of the speculation and alarm caused by its appearance.

It is needless to say anything about legislative protection. In this respect, the omnipotence of Parliament has been exhausted in behalf of the agriculturists. Protection cannot be carried farther than monopoly—and that they have enjoyed for these four years past. We have always said, that even the absolute exclusion of foreign corn could do the agriculturists no real service—that it was merely amusing them with hopes of advantages never to be realized; and if they be not now convinced of the truth of this, they must be as impervious to the evidence of fact as they have hitherto been to argument.

It is not, therefore, in the power of any government, however disposed, materially to relieve the pressure on the agricultural classes. But whatever it can do will no doubt be done. A commutation of tithes, effected once for all on a fair principle, would

be an important and a valuable measure; but, assuredly, its tendency would be to reduce, not to raise the price of corn. We incline also to think that the duty on the sale of landed property by auction ought to be repealed. Its amount is not very considerable; but, as Dr. Smith truly stated, it comes entirely out of the pockets of those who are least able to bear it,—that is, of those who are obliged to sell. But it is upon arrangements amongst themselves, that the agriculturists must mainly depend for relief from any real grievances under which they may at present suffer. Where necessary, rents ought to be reduced and they ought in all cases to be rated in corn or other farm produce, and made convertible into money, at the current prices of the day. But we protest against all indiscriminate plans of reduction. No two occupiers of any estate are in exactly the same condition; and in reducing rent, care ought always to be had that industry, skill, and economy be not discouraged to pamper sloth, routine, and extravagance. The statements we formerly laid before the public (No. 120, Art. 6) are more than sufficient to show, that, in many parts of the kingdom, the landlords ought, before reducing rents, to try what may be done by enforcing improved and more economical modes of management. In the southern counties, especially, there is great room for this. No farmer who employs teams of three, four, or five horses, where two would suffice, is entitled to have one farthing taken from his rent. If he ask it, his landlord may reply, 'Do as the farmers do in other parts of the country—employ two horses instead of four—do more work by the piece—cut down every superfluous expense—endeavour to introduce the improved systems of other counties—and if, after you have done this, the farm be still too dear, I shall willingly make the necessary abatement.' No landlord ought to go farther than this. If he do, he will act injuriously for himself and the public interests, and will be justly responsible for the continuance of practices that are a reproach to the agriculturists of the present day. Something of this sort *must* be done, otherwise the rental of all unimproved and expensively managed farms must come down to the level of 1792. The agriculturists need not cry out for help to others. No stranger can render them any material assistance; but they may help themselves. And, till they have put forth all their energies, reformed whatever experience has proved to be defective in their practice, and pared down all unnecessary expence, they have no right to expect that their complaints should meet with much either of attention or of sympathy.

Should the next, or any succeeding harvest be a bad, or an indifferent one, the prices of corn would rise, it might be, to double their present elevation. That, however, would no way invalidate any of the previous statements as to the extraordinary improvement of agriculture. We believe, too, that it would make an end of the Corn Laws. At present they are virtually suspended by the wonderful increase of our home supplies. But, if they ever again become efficient, assuredly they will not long survive. The manufacturing and commercial classes have become too numerous, intelligent, and powerful to submit to pay a heavy tax on their food, not for any purpose of public or national utility, but for behoof of the agriculturists.

#### HOW TO DESTROY THE RED WORM.

An intelligent farmer has informed us that he has tried many ways to destroy the red worm, but none has proved so effectual as *salt*. Lime, he observes, does not mix sufficiently with the soil when first ap-

plied, and it is only when in a caustic state that it will destroy these worms. One ton of salt per acre is necessary for this purpose, and should be sown on the land a month at least before the crop that is to follow. If on old ley, it is better not to apply the salt on the first year of being broken up, for the worms do not leave the sod until the vegetable matter it contains, and on which they feed, is decomposed; therefore, they do but little injury to the corn crop the first year. However, on the land being pulverized the second year, the salt will have full power to act, as it will mix through the soil and corrode both vegetable and animal matter.

We have heard of some experiments made with salt for this purpose, which have not succeeded; but we must suppose the quantity applied was not sufficient. We also think lime may be advantageously used for the destruction of the red worm, if laid on the land fresh slacked and in dry weather, after being well fallowed for late turnips or wheat. The application of salt is, however, cheaper; and on land on which lime would not be beneficial as a manure, the former might act better in this respect also. On soils that will admit of a light paring and burning, this operation will tend much to destroy the red worm; but the land should be well pulverized afterwards, in order to mix the ashes produced with the part not scorched. Potatoes or turnips should follow this preparation, and there is little risk of the corn crop afterwards. On spongy or porous soils, an admixture of marl, limestone, gravel, or chalk, will be found advantageous, as they will consolidate the land, and make an application either of lime or salt more efficacious.—*Irish Farmer's Magazine.*

#### A MARE STARVED TO DEATH FROM DISEASED JAW-BONES.

BY MR. W. A. CARTWRIGHT, WHITCHURCH.

(From the *Veterinarian*.)

A cart mare, between twenty and thirty years of age, the property of Messrs. Cross and Jagger, in this town, began to quill her food when out at grass; she would nip it off very well, but, when she began to grind it, she dropped it from her mouth. She continued to do so for about a fortnight, until the field was nearly covered with quids, when she died from sheer want. Whilst she was alive there was the peculiar smell from her mouth that indicated diseased bone; but, after carefully examining her mouth, I could only detect two ulcers of the cheek opposite the last of the grinders, one on each side. These ulcers were dressed with a solution of nit. of silver, and the teeth rasped.

POST-MORTEM APPEARANCES.—The ulcers on the cheeks were of little consequence; but, for about an inch beyond the posterior molar tooth, on each side of the inferior jaw, the upper surface of the continuation of the last alveolar cavity was quite ulcerated through, and the bone carious for an inch down each surface: the evil was evidently produced originally by the upper jaw-bone rubbing against it. The teeth were worn down almost to a level with the jaw; but the ulcerated parts did not come in contact so much when the jaws were opposed to each other as when they were moved from one side or the other in the act of grinding. There was no other disease to account for her death, for every part was perfectly sound, except much attenuated. She was starved to death.

## BONDED WHEAT AND FLOUR.

TO THE RIGHT HON. THE LORDS COMMISSIONERS OF HIS MAJESTY'S TREASURY.

THE MEMORIAL OF THE CHAMBER OF COMMERCE, IN THE PORT OF PLYMOUTH, respectfully SHEWETH,

That there are at the present time about five hundred and sixty thousand quarters of foreign wheat, and one hundred and thirty-four thousand barrels of foreign flour under the king's lock, which were imported in expectation that it might be required in aid of the growth of this kingdom. Contrary, however, to former experience, the produce of the United Kingdom, for the last four years, has been more than equal to the consumption, and chiefly from this cause, and the restrictive enactments which exist, this foreign wheat and flour have been lying, most of it for several years, in warehouses, involving consequences most ruinous to the importers, by granary rent, labour, deterioration of quality, and decrease in price, which, with interest of money, amount in some instances, nearly to the value.

That those results are mainly to be attributed to the above causes, which prevent the manufacture in the United Kingdom of foreign wheat into flour and biscuit, for the purposes of exportation only, the duty thereon being prohibitory, (although it is permitted to be done in the islands of Guernsey and Jersey, &c. and in the British Colonies,) thereby driving a profitable and legitimate branch of manufacture and of commerce, out of the hands of the people of this country, who have to bear the taxes and burthens.

That for several years past, there has been a large trade carried on from the ports of Dantzic, Hamburgh, &c. from the United States of North America, and from the British Channel islands, for supplying the British West Indies, Newfoundland, and South America, with flour and biscuit, and at the present moment, encouraged by the prohibitory operation of our laws, large additional steam-power mills are erecting in those countries, for increasing the supply of those articles for exportation.

That it may be presumed those injurious restrictions to which we have adverted, originated, and are continued, from the opinion, that the permission to grind foreign wheat in this country, may operate prejudicially to the agricultural interest: but your memorialists believe this is entirely a mistake, and that the contrary is the fact, as will appear from the following considerations:—

*First.*—As there is a large capital locked up in bonded wheat and flour, there is no doubt, but were it liberated, a great proportion of it would be laid out in the purchase of English grain; to which the present low prices would be a strong inducement, and thus, by taking the surplus out of the market, tend to increase the price of English wheat.

*Secondly.*—The knowledge that there is such a large stock of foreign corn in hand, induces the farmer at times, to push his produce prematurely on the market, from the fear that in the event of a rise in price, from any disaster happening to the crops, or other contingency, the heavy stock of foreign wheat, &c. will be brought forward, and depress prices.

*Thirdly.*—It is well known, that when British ships go to Hamburgh and other ports for flour and biscuit for the supply of our colonies, they, at the same time, take considerable quantities of beef, pork, butter, and other agricultural produce, and articles of foreign manufacture, from the same places, thus depriving the British agriculturists and manufacturers, of their accustomed demand for these articles.

That it appears to your memorialists the remedy for these evils is simple, and easy to be carried into practice, and for which there is a precedent in the Grinding Act of one thousand eight hundred and twenty-four, (5th Geo. 4th, cap. 70,) the outline of which is as follows:—For every specified quantity of foreign wheat delivered out of bonded warehouses, there shall be a commensurate quantity of flour returned in a limited specified time, into bond, for the purpose of being exported. To effect this object it is not necessary that the produce of the identical parcel of wheat taken out, should be returned, but flour made from English wheat might be substituted for it. The quality to be equal to fine flour. The operation to be under the superintendence of the customs, and confined to the principal sea ports. The whole to be subject to such checks and regulations, and protected by penalties, as will effectually prevent any fraud.

That a similar provision should extend to the flour now in bond, which not being fit for bread by reason of its being out of condition, might be advantageously used in paste and starch, for our manufacturers, and other purposes, and the same quantity of British flour replaced in bond for exportation.

Thus, not only without injury to the British agriculturists, but with positive benefit to them, might the holders of foreign wheat and flour, be relieved from the pressure of a burthen, which, in many instances, threatens to deprive them of its whole value; and if a permanent measure, facilitating the manufacture of foreign wheat and flour were found to be desirable, after the result of the experiment on that now in bond were ascertained, it might become an important public benefit.

That the United States of America export annually, upwards of a million barrels of flour, much of it to British dependencies, and to places that would take these articles from Great Britain if we could supply them on equal terms;—also that at the present moment, bonded wheat is thirty-five to forty per cent. lower in England, than wheat of the same quality in the United States,—and that freights from hence to the West Indies, and Brazils, where ships go mostly in ballast, are always at a less rate than from America:—all which evidently shews that England could not only supply those colonies on equal, but on considerably lower terms than is now done.

The circumstances at the present moment are particularly favourable for having this legitimate branch of business restored to this country; and whilst benefitting its colonies, and its shipping, would be adding to the employment of capital, and of productive labour.

Your memorialists therefore, respectfully, but most earnestly request, that your lordships will be pleased, immediately, to take this important subject into your consideration; and by introducing a bill into parliament, sanctioned by his Majesty's Government, facilitate its passing into a law;—thereby relieving your memorialists, and others from a heavy loss arising from the circumstances herein stated, and allowing this nation to participate in a branch of commerce, from which they are, at present, as your memorialists conceive, unjustly and unwisely excluded.

MORLEY,

Dated Plymouth, 29th of Jan., 1836. CHAIRMAN,

In transmitting the annexed copy of a Memorial which has been presented to the Lords of the Treasury, the Committee of the Chamber of

Commerce at Plymouth, respectfully submit to all interested in the question, the following additional observations:—

That the measure sought for, being confined to the Wheat and Flour now in Bond, it would serve as an experiment, by which the working of such a system would be ascertained without danger to any interest; and if not found to answer, it need not be carried further; but if it succeed, it might put this Country in permanent and successful competition with the Americans and other Foreigners, and the Merchants of the Islands of Jersey and Guernsey.

A strong argument in favour of the measure is, that it is strictly analogous to that which has been a considerable time in operation, with the most beneficial results, for refining sugar, smelting of Foreign Copper Ore, and sawing of Foreign Timber.

The manufacture of Foreign Wheat in Bond for exportation is allowed in France, and now proceeding there with considerable activity; and if the prohibition should be continued in this country, the Wheat in Bond here will probably be sent abroad to be manufactured, and we shall exhibit the singular anomaly of throwing into the hands of Foreigners an advantageous branch of business, which might be carried on by ourselves with manifest advantage to many classes of the community, and with injury to none.

The principal, but as it appears to us, very weak objection to the measure, is, that it would be liable to fraud, by the passing of Flour for export, of a quality inferior to that prescribed by the regulation but it is submitted, that there is no foundation for this apprehension.

The very circumstance which gave rise to it, was, we believe, a single attempt to pass inferior Flour, which was instantly detected, and it served to shew, that detection was inevitable, and that there could be no prospect of advantage proportioned to the risk.

Besides, the bare possibility of fraud is no argument against the enactment of a just and necessary law,—the laws of the Customs and Excise are very liable to evasion, as proved by daily experience, but the legislature does not, therefore, cease to enact them. Let the penalties, as regard corn, be severe and rigidly enforced, and there will be no frauds of importance.

An argument has been put forth in opposition to the plan, that it would interfere with the Irish wheat growers and millers, who might otherwise derive benefit from an export flour trade. Now, to say nothing of the selfish character of this opposition, its absurdity is conspicuous. For how can the Irish miller, with the average cost of his Wheat at 40s to 50s per qr, ever hope to compete, successfully, with the millers on the continent and in the Channel Islands, with their wheat at 25s to 30s per qr? Is it not obvious that the Irish millers could carry on a lucrative export trade by grinding Foreign wheat while there is no chance for them with wheat of their own Country? In short, this opposition seems to be calculated to embarrass and injure the holders of Foreign wheat in Bond, without any prospect of advantage to the classes whose interests are pretended to be advocated: and if any advantage had been to be derived by Irish millers from an export trade, why have they not availed themselves of it in times past, particularly of late, when the prices have been so low?

It is a strong fact in confirmation of what has been stated in the Memorial, that in the course of last year, about 25,000 barrels of flour, in addition to a considerable quantity of biscuit, were sent from

Dantzic alone to Britain, which was doubtless, re-exported to our Colonies; and preparations are now in active operation for greatly extending this branch of commerce in Dantzic, as well as in Hamburg and the Channel Islands. Thus we are supinely allowing the Inhabitants of other Countries to enjoy a lucrative trade, which might be easily carried on by ourselves, with manifest advantage.

*Plymouth, 10th February, 1836.*

## TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—As one of the most important measures that ever occupied the attention of the Legislature, as regards not only the interests of the owners and occupiers of land, but also the interests of those who consume its produce, is now about to occupy the attention of Parliament, having been introduced by Lord John Russell to the House of Commons on Tuesday last, by a Bill for the Commutation of Tithes in England and Wales, I beg leave to offer a few observations on some of its leading features, as far at least as can be gathered, of the nature of its provisions, from the public prints.

It may, perhaps, be considered somewhat premature to enter on a discussion of its merits before the Bill is printed and its provisions known, but as my observations will apply chiefly to the principle and machinery of the measure, and not to its detail, I feel the less hesitation in stating thus early my opinions, which if they only have the effect of calling forth, from the better judgment of others, their own refutation may not prove entirely useless; and I shall be most glad to find that the volume of the Bill when published, turns out to be more generally satisfactory than its preface appears to warrant.

I freely confess myself to be an enemy to the whole system of tithes, as an ecclesiastical demand; I disown all authority of civil government in matters of religion, and I submit to the payment of tithes and every other ecclesiastical impost, not as a moral obligation, as in the case of rent or any other voluntary contract, or contribution levied by the state for the benefits of civil government, in which all participate; but precisely as I would surrender my purse to a well-armed highwayman, as the least of the two evils. Civil government I take to be, the condensation of the public will by a systematic delegation for public good—to govern the *actions*, and not the *thoughts*, or *consciences* of men—to regulate the affairs between *man and man*, not between man and his *Maker*—to legislate for *this* world, not for the next. Religion is not an affair to be managed by proxy, as there can exist no relation between the proxy and the principal. The utmost duty of the state in this respect is to afford *equal protection*: all beyond this is impious and unwarrantable usurpation; neither can it be defended on the ground of *expediency*, as it will only tend to defeat what it affects to defend, the best interests of religion. The present state of both England and Ireland at this moment is, I think, strong evidence of the truth of this position.

Under these impressions I can never feel fully satisfied with any measure which has not for its *ultimate* object the *entire and unqualified extinction of tithes*. But, nevertheless, I should be inclined to hail as a great boon any intermediate plan, which appeared at all calculated to put an end to the evils of the present system, which are so ruinous to the interests of agriculture and injurious to the cause of religion;

particularly if it appeared at all calculated to facilitate a fair and final settlement of this great question.

As Lord John Russell appears to have confined himself to the question of tithes, simply as tithes apart from any consideration of appropriation or other ecclesiastical or political views, it presents itself chiefly as an agricultural question; or, in other words, an adjustment between the land-owner and the tithe-owner—between the *one-tenth* and the *nine-tenths*.

Now, although I have always looked up to Lord John Russell as being honestly anxious for a considerable reform both in church and state, and should have been glad to have seen his popularity increased by a satisfactory measure respecting tithes, yet I must confess that his plan of commutation appears to me to be defective both in principle and machinery, not calculated to afford the relief it promises, in many respects utterly impracticable, and will leave many of the objections to the system just where it found them.

I dare say we (the tithe-payers) shall be likened to the soldier at the halberds, very difficult to please: so said Lord Althorp when the Deputation from the Central Tithe Association pointed out what they considered to be the defects of his Commutation Bill. "Three or four different measures," said his Lordship, "have been proposed, all of which have been rejected." And, why is it? For this plain reason; that, like the cat-o'-nine-tails, let the drummer hit how and where he would, we feel the tithe as a most galling and intolerable scourge, and which neither of the measures proposed was calculated to mitigate, much less remove.

Some tithe-payers say, "Let us not be over nice lest we get nothing; let us take what we can get, and be satisfied." What! are we then asking some great favours? By no means. Tithes are a grievous wrong; the public voice *demand*s that the wrong shall be redressed. Then why do right by halves? It ought not to be forgotten that this is to be a final measure. As an abolitionist, I should say, the longer commutation is delayed the better. The continued depression in the prices of the production of the land, and the accumulation of public animosity towards the injustice of tithes, will in a very short time render any scheme of commutation unnecessary, by settling the whole question at once.

Lord John Russell is reported to have said, "There are two things to be borne in mind: the one is, the principle upon which we propose the settlement of this question; the other, the machinery by which it is intended to carry it into effect." His Lordship, however, immediately turns his matters the other way foremost, and sets his machinery before his principle. "I propose," continues his Lordship, "in the first place, that a Board of three Commissioners be appointed, two to be nominated by the Crown, and one by the Archbishop of Canterbury." Now, this brings me to one of my great objections:—

This professes to be altogether a *temporal* measure; every consideration of any thing, even approaching to the spiritual interests of the church is studiously avoided; then what shadow of pretence can there be to trouble the archbishop in this matter, particularly with the lay tithes? Is not the king the proper and ostensible temporal head of the church? or, to speak more literally, "the only temporal head under Christ." I should have thought a sufficiently powerful representative. Now it does not appear to me that out of this trinity of commissioners, the church will, at any rate, have the best two in three.

Many of the worst political evils with which nations have ever been afflicted, have arisen from the superstitious weakness of kings, operated upon by the subtlety of designing priests; take the origin of tithes in England as an instance, and as this is to be a permanent measure, although there is not the slightest danger from present parties, it may be well to be on our guard for the future. If I am not greatly deceived in my ideas of the mechanism of the measure, this great defect in the first motion will be likely to run through the whole gear, and render it not at all calculated for the manufacture of measures of justice.

Next comes the principle; and here lies my principal objection. If this is to be an adjustment between the landowner and tithe-owner—between the one-tenth and the nine-tenths, as a *permanent* measure, (mind this,) what can form so correct a basis as the inherent *value*, the fee-simple, the rental of the land. Oh, but, says Lord John Russell, "It is our intention to interfere as little as possible with existing interests. It seems obvious," continues his lordship, "that the principle should be, to take the annual value of tithes, and have it commuted for an equivalent in some other species of property less objectionable in its manner of payment. Tithe is a claim on the *produce*, and bears no relative proportion to *rent*, and therefore it would be unjust to change the claim into another which was never contracted for nor calculated upon."

If I rightly understand this part of the proposed measure, the prospect of relief is very obscure. If "equivalent" means *equal value*, the relief will be from paying in money to that of paying in meal. As a tenant I should consider the measure scarcely worth a straw; and the landowners would be better off without it.

Let us just apply it to the parish of East Church, in this county, where the tithe-owner has virtually ousted the landowner of his inheritance. The overgrown claim to tithes has rendered the land not worth a shilling to rent. The one tenth has swallowed up the other nine. The bill will *relieve* the tenant by allowing him to pay—just the same. And not only so, but it will leave his goods and chattels liable to the distress warrant of the tithe man; no very desirable equivalent for the tithe-waggon. It will indeed *relieve* the owner of the land in such cases of all his earthly troubles and incumbrances for ever, except the possession of the title-deeds.

I cannot see the weight of Lord John Russell's objections to taking rent as a basis of commutation; and as to taking a retrospective estimate of value for seven years past, I am quite satisfied it is altogether impracticable. Tithe will still be a tax on capital. To use his lordship's own words, it will still be "a penalty upon capital and industry, and the greatest punishment upon those who lay out the greatest capital and employ the most labour; and according to the spirit of the tithe-law which appears to suppose cultivation a crime, it will go still further, as it will be an infinite punishment for a finite offence. It ought to be borne in mind that this measure proposes to give a *certainty* for an *uncertainty*. Tithes are no inheritance any more than a milk-walk, or a deputation to fish or kill game; a sort of indefinite nondescript privilege, to "have and to hold" a tenth of such produce as the will of the cultivator allows them to get hold of; a claim which has been encroaching from time to time from the tenth of the *increase*, to the tenth of the gross produce; and, after having shifted the burden of supporting the poor, repairing the churches, and the whole weight of taxation on the nine-tenths, till the string has been strained too tight even for its own purpose, like the toad in the fable, it has been

swelling and swelling, till there was great danger of bursting, and then is to be settled by an "equivalent!"

Lord John Russell observed, that it would be unjust for the law to convert the claim which was now on the produce, into a claim on the rent; but this would go far towards upsetting his principle if applied to it; for here is a precarious, undefinable claim which has become so universally unpopular that its future existence is in a state of jeopardy, converted into a permanent claim, which is to have precedence of all others, with power to seize and enter on the land; so that, in future, the claims on the land are to stand:—Church, No. 1; Poor, No. 2; and, if there is any thing left, (which there would not in such cases as that of East Church) the Owner will come in No. 3.

I do not think with Mr. D. W. Harvey, that it would prove any concession to the landed interest, because 25 to 40 per cent. off the gross amount of tithes for the last seven years, is not more than adequate to the depreciation at the present time, with little probability of an advance, except from short crops; but I agree with him that it promises no relief to the consumer, on the present scale of cultivation, but there are thousands of acres now lying comparatively fallow, which would spring into cultivation directly it became released from tithes as a claim on its produce. The additional charge on hop land, gardens, and orchards, is an evident tax on what is put into the land, rather than on the land itself. A great proportion of hop land is very little, if any, more profitable to cultivate, on an average of years, than land used as sheep-walk, on account of the great outlay required, and the uncertainty of the crop; and market garden and other cultivation requiring a great portion of labour, is just what the legislature ought to encourage. It ought to be at a premium instead of a discount.

Levisham,  
Feb. 18, 1836.

Your's respectfully,  
GEO. COLGATE.

### TO THE EDITOR OF THE FARMER'S MAGAZINE.

MR. EDITOR,—I beg through the medium of your very useful and widely circulated miscellany, to seek for information on a subject of general interest; although it may not be strictly speaking of an agricultural character. I mean the valuation of property, with a view to its assessment, for the relief of the poor &c.

As my present application arises out of a particular case, I will beg leave to state the circumstances of it, and trust that some of your intelligent correspondents will be kind enough to favour me with replies to the following questions in your April number.

The Parish I have in view is principally agricultural, and contains about 4000 acres. Its population is nearly 2000, and includes all the professions,—the different kinds of tradespeople, &c., &c. There are Inns and Public Houses in the place, and Fairs and Markets are periodically held there. There is consequently a demand for the land immediately contiguous to the town, particularly the small inclosures which let for a much higher rent than that occupied for farming purposes only.

The first question I would beg to propose is, whether this land usually called accommodation land, should be valued at its actual rental, supposing the same to be done with the farmer's land, or only at the same rate as that of a similar quality occupied by the latter?

It will happen that land which might be let as accommodation land is included in farms, and of no more value to the occupier than the rest of his farm, would it in that case be proper to value it as if so let, or should it be assessed only at the same rate as his other land?

My next enquiry respects the houses, and taking them at their clear annual value, after allowing what may be necessary to keep them in repair, I would beg to ask what allowance or deduction should be made from such annual value in consequence of their being perishable property?

I apprehend that there are no statutory directions for the valuation of property for the above purposes? If that should be the case I should be glad to be informed of it.

I am, Mr. Editor, with much respect, one of your constant readers from the commencement of your Publication, and  
A RATE PAYER.

Lincolnshire, Feb. 19, 1836.

### ON ROT IN SHEEP.

MR. EDITOR,—In your Journal of last week, I observed a quotation of a very clever article upon this subject; and it is greatly to be regretted that the country press does not more frequently devote a column to such decidedly useful information. It is not in order to find fault with the learning and research which that article displays, or to smile at the simple remedy of the Lammermuir farmer, that I have ventured on these few remarks; but because I am convinced of the great justness of them, and that if judiciously carried into effect, in a short time we should hear nothing of rot. Drugs, I am convinced, from a fair experience, and by repeated trials which many respectable farmers in this county have kindly undertaken, are of no avail—or, if any, very little; because, when the disease is observable to us, it has attained a stage scarcely admitting of arrest; and if arrested, is generally effected by a change of pasture, and a return to dry food, which can receive very little assistance from medicine. With the idea of the writer of that admirable article to which I have alluded, that the rot has its cause in the butter cup (*ranunculus*), which is described as being excessively acrid, producing in some animals, soreness of the mouth and even capable of raising blisters, I am as little satisfied: for we often find sheep attacked with rot when feeding in pastures in which they by no means prevailed, but are absolutely scarce. The remedy of the Lammermuir farmer will furnish, I think, a better solution; and even its occasional failure assist us to a better, and perhaps, the right mode of application. He states that common salt is a decided cure. "The dose, an ounce and a half, given in three-fourths of an English pint of water, to a sheep with an empty stomach, for three or four mornings." The writer of the article above referred to says "Lime-water is also good; I have seen both given." Now putting aside the question of how flukes in sheep are generated, and worms in the animal frame universally, (which has hitherto puzzled, and will probably puzzle, the inquirer to the end of time,) let us rather pay attention to the method which Nature, in her unrestrained state adopts, to keep under this evil in the animal economy. Every observant individual must have been struck with the predisposition of animals, at certain times, to eat earth; but if they had observed more closely they would have discovered that they would not eat *any* kinds of earth, and that those they did eat, were in their nature ab-

sorbents, and capable, with the union of the acids of the stomach, of becoming salts, or such as in themselves contained alkali, which, in similar combination, would produce a still more active medicinal effect upon the system. This instinctive action must, at one time or other, have been observed by us all; but if these animals were left to themselves, and not confined by hedge row or dike, but were at liberty to select what and where they pleased, can we imagine, that that instinct which directs them to this substitute, should fail to lead them to some spot where the proper remedy might be found scattered with a more liberal hand and purer? Such an omission in nature we never find. Such a compelling to unnatural appetite is adverse to her rules. Look to those immense interminable pastures of Western America, out of which, in the course of a season, it would be almost impossible for the herds they feed to escape, were they so disposed. They are provided, here and there, with extensive salt licks, to which the animals repair, and around which they generally subsist, and the shores of lakes (salt lakes), in America, Africa, and India, attest to the periodical visits of all kinds of graminivorous animals who have no salt licks scattered amidst their native plains and forests, and if carnivorous animals are also found, shall they not also follow the instinct of their nature, and where the prey is, be collected together? That these are facts, no one doubts, and are closely connected with the instinct of animals, to eat earth, which we find to be the case at home. Now the question we have next to do with, is, the cause of this instinctive habit! and here it is the researches of chemistry will greatly avail us. It has been remarked, by a close observer, that "in some countries which are not blessed with mines of salt or salt waters, the necessities of the inhabitants have forced them to invent a method of extracting their common salt from the ashes of vegetables; and the ingenious Dr. Fothergill extracted plenty of it from the ashes of fern—a custom now commonly practised by the poor in many parts of this country, who use it as ash balls as a substitute for soap. But the experiments of Kirwan and Dr. John, of Berlin, have most satisfactorily assured us of the presence of alkali in grasses, to an extent that perfectly astonishes us: and were it not that it would be out of place here, many quotations of their labours and of others might be made with much interest and profit. One thing may be noticed, that vegetables contain most alkali just before they seed. Hence it seems to follow, that much of the nourishment of vegetables, as food for animals, depends on the presence of alkali or salts: and that such should be the case, is in perfect agreement with modern discoveries. Mr. Boyle discovered common salt in blood and urine, and "I have observed it," says Dr. Brownrigg, "not only in human urine, but also in that of cattle;" and he further remarks, "the dung of such animals, as feed on grass or grain, doth also contain plenty of common salt." It therefore may be concluded, that if it is necessary to the animal economy, we should find it in animal food, and this we find to be the case. And how necessary it is to the animal economy, we scarcely need the discoveries of modern science to tell us, when we reflect on the instinctive efforts which the whole of the graminivorous portion of the animal creation make to obtain it. But why, you ask, is this effort made? This was the original question, and the answer to me appears to be this:—1st. We find the rot prevail at those times and places where vegetation is most rapid and luxuriant. 2d. We find that a very rapid growth of vegetation is unfavourable to the formation of the salts necessary for graminivorous life. 3d. That

lacking it in their daily food, unless a substitute is found, the stomach, for want of a corrective, produces a depraved state of health favourable to the development of the disease, of which the appearance of flukes is but one, and probably one of the last stages. The method nature adopts to guard against this tendency to decay, by impregnating vegetation with salt, has been interrupted: and if the substitute instinctively sought for be denied, the consequence which we witness, I apprehend, must follow as cause and effect.

This view, I think, does not militate against the simple recipe of the Lammermuir farmer, nor is it opposed to the advantages we find in removing sheep from a rich, luxuriant pasturage, to dry food, gathered at the proper season, and naturally impregnated with salt, nor to their removal to drier land, where the growth of vegetation is slower, but the saline properties better prepared, all of which we know are among the best methods of cure. But cannot some more efficient method of giving salt be found than directed above. Sheep are naturally fond of it, will lick it readily, and as I conceive the entire success of the remedy depends on its use in the earliest stage, at a period of disease when the best informed grazer could detect nothing amiss, I would suggest to place in each field a lump of rock salt, the larger the better, that sheep, with the first impulse, may run to it; or if rock salt cannot be had, the Spanish method, mentioned in your quotation of last week, will answer just as well. In another part of the field I would throw down a heap of chalk, and with these two remedies at hand, the instinct of the animal will correct the faults of nature, and oftentimes the thoughtlessness of man. I may be allowed to add, that there are some gentlemen in this county who have adopted this suggestion, and some have told me, with a success far surpassing their expectations; while others have gone so far to think that, if uniformly adopted, we might hear nothing more of rot.

Should these remarks draw further attention to the subject, or induce any to try the remedy, so cheap and of little trouble, they will have answered their end. Your obedient servant, B.

### THE CATTLE MARKETS OF FRANCE COMPARED WITH THE LONDON SMITHFIELD.

The Beef of the first quality at Sceaux sells for 53 centimes the  $\frac{1}{2}$  kilogramme, equal to about 3s 8d the stone of 8lbs. sinking the offal; the second quality at 48 centimes, corresponding to 3s 2d the stone. Cow Beef sells for 47 centimes, equal to about 3s 1d the stone of 8lbs.

Veal is sold at 74 centimes, equal to 4s 10d the stone, and Mutton for 69 centimes the  $\frac{1}{2}$  kilogramme, equal to 4s 6d the stone.

At Ruffee, Beef of the first description fetches 52 centimes the  $\frac{1}{2}$  kilogramme, equal to about 3s 7d the stone, sinking the offal; and the second description 47 centimes, corresponding to 3s 2d the stone.

Veal is sold for 72 centimes, equal to 4s 10d the stone. Mutton at 70 centimes the  $\frac{1}{2}$  kilogramme, equal to 4s 9d the stone; and Pork at 28 centimes the  $\frac{1}{2}$  kilogramme, equal to 1s 10d the stone.

The market of Maison Blanche quotes Beef of the finest quality at 54 centimes the  $\frac{1}{2}$  kilogramme, equal to about 3s 8d the stone of 8lbs. sinking the offal; and the second description at 50 centimes the  $\frac{1}{2}$  kilogramme, corresponding to 3s 4d the stone.

Mutton sells for 68 centimes the  $\frac{1}{2}$  kilogramme, about equal to 4s 6d the stone of 8lbs. sinking the offal; Veal at 72 centimes, corresponding to 4s 9d the

stone; and Pork at 26 centimes the  $\frac{1}{2}$  kilogramme, equal to about 1s 8d the stone.

From the foregoing facts, the following results are deduced, viz.—that

First—the extreme price of Beef, at Secaux, of the first description, being 3s 8d the stone, the currency and weight of France being reduced to that of England, which compared with the extreme price of Beef of the first quality at Smithfield on Friday last, which was 4s 8d the stone, shews a difference of exactly 1s per stone between the price of Beef at Secaux and at Smithfield; the price of Veal being equal to 4s 10d the stone, which as compared with that of London, which is sold for 5s 8d, shews a difference of 1s 2d per stone; and Mutton being sold for 4s 6d per stone, when compared with that of Smithfield, sold for 4s 10d, gives a difference of 4d per stone.

Secondly—Beef at Ruffee being sold for 3s 7d the stone, when compared with the Beef sold at Smithfield on Friday last, which obtained 4s 8d the stone extreme price, gives a difference of 1s 1d per stone; Veal selling for 4s 10d the stone, and that at Smithfield realizing 5s 8d, gives a difference of 1s 2d per stone; the Mutton fetching 4s 9d the stone, and the meat of the same denomination at Smithfield being sold for 4s 10d extreme price, gives the difference of only 1d per stone; and Pork selling for 1s 10d the stone, and that at Smithfield fetching 3s 4d per stone, gives a difference of 1s 6d per stone.

Thirdly—the Beef at the market of Maison Blanche being sold for 3s 8d the stone, when compared with that sold in London, gives a difference of 1s 2d per stone; Mutton being quoted at 4s 6d the stone, when compared with that of London, gives a difference of 4d per stone; Veal selling for 4s 9d per stone, when compared with that sold at Smithfield, gives a difference of 11d per stone; and the Pork fetching 1s 1d the stone, and that at Smithfield selling for 3s 4d the stone, gives a difference of 1s 8d per stone.

### A CASE OF ACUTE FOUNDER IN BOTH FORE FEET.

BY MR. GEORGE CLELAND, ROSEWELL, MIDLOTHIAN, N. B.

(From the Veterinarian.)

On the 2nd of August, 1831, I was called on to attend a black mare, of great value, that had been ill for about three weeks, the property of Sir John Hay, Bart. I found her pulse above 70 per minute, and her breathing was very laborious. Both soles of her fore feet were burst, and there was an oozing from the coronets. I was informed that she had been bled often, and poultices applied to her feet; her body was all covered with sores, particularly about her elbow, occasioned by striking with hind feet; her head and hock joints were also much cut and bruised. I dressed these parts with a mixture of oil and tinc-benzoin, made into a liniment with Armenian bole, in order to keep off the flies.

It was supposed, by every person that saw her, that she would never recover, but must die from her wounds and dreadfully emaciated state; but her owner being anxious, if possible, to save her as a breeding mare, she was, with difficulty, got into a loose box, lined or almost filled with straw: laxative and fever medicines were administered; and she was ordered to have little food besides mashes and gruel, and occasional clysters. I carefully detached both soles, and also the side walls of both fore feet, and every portion of the diseased laminae was well cleaned; and then, being washed

with a lotion of sulphate of copper, the whole was dressed with a digestive ointment, and large poultices of linseed meal applied, which were changed twice every day. She was attended by a son of mine (a pupil of Mr. Dick) for the first fourteen days and then delivered over to the care of a blacksmith, as we were at a distance of nearly eighteen miles from her.

January 1832.—I visited her for the last time: her feet were looking well, almost of their natural size, and having their proper concavity. She had not yet been out of the box. I measured both forefeet, and went to the blacksmith's shop, and had two fore shoes made for her, and shod her in the box; and when I led her out I was pleased and surprised to see how well she went. I was not content with this, but had her put into harness, and was still more pleased with her action and way of going. She is still living and doing well as a breeding mare; but she has a little of, what you gentlemen in the south call, navicular disease.

INCENDIARISM.—A placard, showing the loss of wages to labourers and others by the wilful destruction by fire of a stack, containing fifteen loads of wheat, has been circulated in the neighbourhood of Hedingham, and is well calculated to convince the unthinking incendiary—if a creature so dead to every human feeling be not impervious to common sense—that in making the midnight attack on his master's property, he is raising his hand against himself, and adding to the misery of his family, whose wants he would probably plead in mitigation of his cowardice and crime. The following is given as the probable loss of wages in the destruction of the stack containing the quantity above stated:—

	£ s. d.
Taking Stack into Barn .....	1 0 0
Threshing, at 2s 2d per quarter .....	8 2 6
Dressing, at 2d per quarter .....	0 12 6
Loading, carrying out, and unloading ..	1 17 6
Grinding and Dressing at the Mill, at 7½d per bushel of 5s the quarter.....	18 15 0
Making into Bread and baking 450 bushels of Flour, or 7,500 loaves of bread ....	15 0 0
Probable loss of labour to Thatcher on three loads of Straw .....	0 18 0
Attendance of Cattle in making the Straw into muck .....	1 10 0
Carting muck on to Land including stirring over and spreading .....	1 7 0
Total loss of Labour.....	49 2 6

This 49l, if circulated, as it would otherwise have been, amongst the labourers and tradesmen of a small rural parish, would have supplied many a comfort to the poor, who, when gazing on the rising flames, must necessarily have cursed the miscreant whose folly had deprived them of a meal. And what does the owner of the stack lose? Absolutely nothing. He is insured to the full amount; and the loss of the 7,500 loaves, together with the value of the bran and pollard, falls, as the placard observes, exclusively upon the poor. This simple statement, independent of the fears and apprehensions which ever track the steps of the guilty, ought to convince the incendiary that his crime admits of no palliation, and that its effects, however secretly the act may be perpetrated, will fall upon the heads of his own friends and family.

## COURT OF EXCHEQUER.

LANG F. SPICER.

This was a case under the bastardy clauses of the new Poor Law Amendment Act, the 57th section of which enacts, "That every man who, from and after the passing of the Act, shall marry a woman having a child or children at the time of such marriage, whether such child or children be legitimate or illegitimate, shall be liable to maintain such child or children as part of his family, and shall be chargeable with all relief, or the cost price thereof, granted or on account of such child or children, until the time shall respectively attain the age of sixteen, or until the death of the mother of such child or children, and such child or children shall, for the purposes of this Act, be deemed a part of the husband's family accordingly." The facts had been drawn up in the form of a special case, in order to save both parties unnecessary expense, and now came under the consideration of the Court in the special paper. The facts set forth in the case, were as follow:—That the plaintiff in 1832 had an affiliation order made upon him for the maintenance of a bastard child at the rate of 2s. a week. That sum he had continued to pay to the parish officer of Portsea, near Portsmouth, until March, 1835, some time after the passing of the new Poor Law Act. He was then advised not to pay any more, the mother of the child having married to a labourer in November, 1834. The plaintiff was summoned before the Mayor of Portsmouth, who decided that he was still liable to pay upon the order of affiliation. The plaintiff refusing to pay, the mayor issued a warrant for his apprehension, upon the execution of which, the money was paid, and an action for assault and false imprisonment was commenced against the mayor. The damages were laid at 10*l.* in the special case. It was admitted that the husband of the woman by whom the plaintiff was alleged to have had the illegitimate child, received 15s. wages, out of which he maintained his wife and his own child. The mother regularly received the 2s. weekly from the parish for the child born before marriage.

Mr. THESIGER argued the case for the plaintiff, and contended that the words of the act were too clear to admit of any doubt as to the meaning of the Legislature. By the 57th section of the act, the husband of a woman who had an illegitimate child at the time of her marriage was to be "liable to maintain such child as part of his family." That provision was clearly exclusive of all extrinsic aid towards maintenance. The act in question showed that the object of the legislature throughout was, to make the woman a more rigid guardian of her own chastity, by multiplying the pains of immorality. If they were to construe the 57th section to mean that the child should have a step-father and the putative father both liable for its maintenance, it would operate as a premium upon bastardy.

Mr. DAMPER, for the defendant, submitted that the 57th section of the act was not intended to have a retrospective operation. The order of affiliation made upon the plaintiff in 1832 was to last during the life of the child to a certain age, and the statute could not weaken the force of that order without express words to that effect. The husband of the woman was to be "liable to maintain," &c.; but the statute said nothing as to when that liability was to commence. It might be upon the death of the putative father, or, in case the woman had not been able to fix upon a father, or the father fixed upon had become insolvent.

The Court were unanimously of opinion that

under the act in question the putative father of a bastard child was not liable to be called on for any payment for the maintenance of the child, where the mother had, as in the present case, married, and her husband was in a condition to support it. The business of the Court was to interpret strictly according to the words and the legal meaning of the provisions of acts of Parliament. The mother's marriage to a man able to maintain her child, suspended the order as regarded the parish, which became exonerated, at least during the life of the husband, or until the child became chargeable to the parish.

Judgment was given for the plaintiff, with 10*l.* damages.

GREAT AGRICULTURAL MEETING AT FARINGDON.—A meeting of the landholders in the neighbourhood of Faringdon was held at the Crown Inn, in that town, on Tuesday, at three o'clock, T. M. Goodlake, Esq., in the chair, to draw up petitions to both houses of Parliament, praying that they would be pleased to appoint a Committee to inquire into the best means of relieving the distresses of the agricultural interest. The Hon. Chairman addressed the meeting, at considerable length, in a speech replete with eloquence and good old English feeling. After stating that he had considerable doubt whether the Corn Laws had ever been of any real advantage to the agricultural, whilst it was certain that they did materially retard the commercial interests of the country, he gave it as his decided opinion that *the remedy lay rather with the landlord than with the Legislature; and that a liberal reduction of rents would do more to bring back prosperity to the farmer than all the Parliamentary enactments in the world.* (This sentiment was most enthusiastically received by the meeting.) The hon. Genl. added, that *any landlord, who affecting to compassionate the distresses of his tenants, advised them to petition Parliament, and at the same time withheld from them the effectual remedy which he had in his power to bestow, did so merely to promote his own interests,* and reminded him of the monkey in the fable, who, under the pretence of benefiting the cat, thrust poor Grimalkin's paw into the fire in order to procure the chestnuts for himself.—Thanks were voted by acclamation to the Chairman, and the meeting, after signing the petitions, separated much gratified with the proceedings of the day.

"MONEY MAKES MONEY."—This homely, though most true adage, was never more clearly exemplified than in the late great advance in cask butter. The hilly farmers, without capital, were compelled to sell their salt butter in November, and early in December, to meet their Christmas rents. The price then was from 8*l.* to 9*l.*—very little so high as 9*l.*, and some lower than 8*l.* Within the last three weeks it has advanced to 13*l.* by the cask, and it is retailed at 14*l.*; so that they who have been able to hold their stock will gain about 5*l.* a pound. A hilly farmer, renting 25*l.* or 30*l.* a year, will often sell four casks of butter weighing from 80*l.*s to 100*l.*s; so that the monied farmer will have an advantage of 7*l.* or 8*l.* over the poor one. The great advance in this article is not only attributable to the unusually dry summer of 1835, but to the very great heat which occasionally prevailed, at which time no butter could be made at all. We have heard of several large farms where scarcely any butter was made for three weeks successively. At Carmarthen, the beginning of the week, they were shipping butter busily for the English market.—*Merthyr Guardian.*

Bets are pending in Exeter, that wheat will be 7s per bushel, by the 1st of May. And in the same way, that it will attain that price by the 1st of June.

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

At DORCHESTER CANDLEMAS FAIR there was an unusually large supply of cow cattle. The following is a statement of the state of business in general at this fair:—cows and calves were in demand, and sold well. Barreners from 15 to 20 per cent. higher than at the neighbouring markets a fortnight or three weeks ago. Fat bullocks fetched on the average about 10s per core. Mutton and lamb were in short supply—the former 7d the latter 8d per lb. Pigs were in great abundance, many from the west country, as low down as Bodmin—the sale was brisk at higher prices. Horses were a poor show and met with a dull sale. Cheese and butter were on the advance—the demand was good. The wool sellers stood up for 22d. per lb, some few small lots only were sold from 8d to 20d per lb. Wheat trade on the advance, say 6d per bushel higher. Barley rather flat, from 28s to 32s per qr. Oats from 22s to 26s per qr. Peas and beans rising, the former from 21s to 23s per sack of 4 bushels; the latter from 18s to 20s ditto. Red clover seed high, from 56s to 70s per cwt. Trefoil from 18s to 21s per qr. Rye-grass from 34s to 48s per qr. Hop and rye from 24s to 30s per qr. On the whole this was a selling fair, there being a great demand for almost everything.

DEVIZES CANDLEMAS FAIR, happening on the same day as Bath Fair and Melksham market, there was not so good a show of stock, &c., as is usually exhibited; and the sale was dull in consequence of the stock of hay in hand being in many quarters small. Of horses there were a great many, but very few good ones; those that were good for any thing were eagerly sought after, and maintained good prices. The greater number of beasts and horses exhibited, were of a very inferior description. Heifers sold at from 7l. to 11l. a-head; oxen, from 10l. to 17l. There has been an advance on horned cattle of 10s each, since this time twelvemonth.

BATH FAIR was attended by a considerable number of dealers. The supply of fat cattle being very limited, the whole were soon disposed of at advanced prices. Fat sheep were readily picked up at from 6½d to 7d per lb; the number at the fair being inadequate for the supply of the purchasers. There was a large quantity of lean stock, which sold tolerably well; good grazers realizing high prices.

EXETER FAIR produced a larger number of bullocks; sales were brisk, and the prices obtained were generally satisfactory. The fair wore a very business-like appearance, and the sales effected were very numerous. The first-rate fat beasts realized 10s per score, the prices descending with the quality, from 9s 6d to 8s 9d per score. The lean stock appeared in a thriving condition, and sold, the best plough oxen from 30l to 35l the pair; steers from 20l to 25l the pair; barren heifers varied according to their quality, from 6l to 9l each. The number of cows and calves was small, and of rather an inferior description; prices were from 8l to 11l.

ASHBOURN CANDLEMAS FAIR was well supplied with barren Beasts, which sold well at high prices. Fat cattle were very scarce, but what few there were fetched good prices. There were but few fat sheep, which sold at 6½d per lb. The horse fair was well stocked with horses of the waggon kind, as also hacks, but mostly of inferior quality.

WIRKSWORTH FAIR was well attended, there was a tolerable show of cattle, but not quite so much business done as might have been anticipated from the briskness of several late fairs. There appears a general scarcity of fat beasts which maintain a ready sale at advanced prices.

DUMFRIES HORSE FAIR.—The show of horses on Tuesday was not very great, but a number of very good animals were picked up by the dealers at the different portals ere they reached the Sands. The show on Wednesday was more extensive, including a fair proportion of good horses which were readily picked up by the dealers, a great number of whom were in attendance. The show consisted chiefly of draught horses, and inferior animals for saddle or harness, the number of good saddle or harness horses being rather limited, and much below the demand. The prices obtained for good animals were fully higher than those of the Candlemas fair of 1835. We may state generally, that sound draught horses ranged from 18l to 40l, a number of good colts having reached the latter sum, and a few brought even a fully higher price. The best order of roadsters gave from 40l to 50l. The sale of inferior roadsters was slow, and many remained unsold.

There were few horses in the Glasgow market, on Wednesday; the attendance was not large and sales were dull; few draught horses brought higher prices than 25l. Pigs were selling quickly; six months old pigs were 9s to 10s each; fed pigs, 24s to 25s; among the stocks of young pigs there were several of a brown colour, much like the colour of hares, called Dutch pigs, for which 9s was asked. There were a few female servants in the market; the wages till Whitsuntide, for good servants, were from 30s to 2l.

SHERBURN, NEAR MALTON. — From its vicinity to the Wolds, the chief sheep district in this part, and its central situation in regard to the agricultural and grazing villages both in the North and East Ridings, this market promises to become one of first-rate utility. Nearly 300 fat Sheep, and upwards of 60 head of Cattle of a superior description were shown, the greater part of which went off readily at an advance in price. This market has only been established within the present year, (by permission of the Hon. M. Langley, the lord of the manor,) and it is now considered a matter of surprise, that a situation possessing so many natural advantages, should have been so long overlooked.

The petitions adopted by the Agricultural Association formed in this county, have been signed by 1840 persons, and will be immediately forwarded, one to Lord Abingdon for presentation to the House of Lords, and the other to R. Palmer, Esq., M. P., for presentation to the House of Commons.—*Reading Mercury.*

SOUTH HAMS.—The young wheat has generally a healthy appearance.—*Exeter Gazette.*

PLOUGHING MATCH.—On Tuesday the 9th inst, the annual Ploughing Match for the hundreds of Dungeoddy and Kemes Pembrookshire, took place in a field on Boulston near Haverford West. Soon after 10 o'clock 32 ploughs entered the field, and moved round the headland to their respective stations, which had been appointed to every one by lot, according to

the arrangements of the managers. On the signal being given for starting, they all moved off in funeral time, every nerve being strained to draw the straightest furrow. After each man had backed his ridge, the pace improved, some say the young ones went too fast and the old ones too slow; but that as it may, it was a most gratifying sight to every beholder, the morning was not propitious, but towards noon it cleared and held up, so that the men worked in their shirt sleeves. The teams did credit to their several owners, and if any fault could be found, it was with the horses being too fresh.

After the work was finished, the judges awarded the prizes as follow:—

First prize to Isaac James, ploughman to Mr. Gibbon, Rogers hook.

2d do. To James Lewis, ploughman to Mr. Gwyther, Farthens hook.

3d do. To John Phillips, ploughman to Mr. Rees, Arnolds Hill.

4th do. To William Prickett, ploughman to Sir R. Phillips Bart, Picton Castle.

5th do. To Thomas John, ploughman to R. J. Ackland, Esq., Boulston.

6th do. To William Morgan, ploughman to R. J. Ackland, Esq., Boulston.

7th do. To William Lobston, ploughman to R. J. Ackland, Esq., Boulston.

8th do. To James Griffiths of Hencod.

After the business of the field was done, the company returned to Boulston farm, lent the managers for the occasion, where a dinner was provided, and during the evening resolutions were entered into to support and encourage ploughing matches. It was also resolved that the ploughing match for February 1837, should take place at Hare's Head, in the Parish of Wiston, and a cattle show held on the same day in the village of Wiston.

THE LATE STORM.—The damage done during the late hurricane and by the extraordinary high tide of

Thursday last, is greater than was at first supposed. An immense number of boats and barges have been swamped in the Thames, and cargoes consisting of goods of all descriptions lost, while large quantities of corn in the granaries, and goods and furniture in the warehouses and dwellings along shore, have been spoiled or destroyed by the irruptions of the flood.

The violent gales have been very general throughout England. The damage done on the Yorkshire coast is considerable. By the swelling of the waters consequent on the continued gale from the north-west, many of the lower streets of Hull have been inundated, and the cellars filled with water. On the Holderness coast large districts have been laid under water. An agriculturist of Kilnsea estimates his loss at upwards of 1,000*l*. Some of the occupiers contemplate giving up their farms in consequence of the great injury they have sustained. The shore is strewn with wreck, and the keel of a sloop has been found in a field a mile from the usual boundary of the sea.

In the neighbourhood of Clay nearly one thousand acres of land have been inundated, and the streets of that town have been nearly filled with the wrecks of boats and timber which has been torn up by the roots.

BREACH IN THE BANKS OF THE GREAT RIVER OUSE, NEAR LYNN, NORFOLK.—The utmost consternation prevails in the neighbourhood of Lynn, in consequence of a breach in the eastern bank of the great river Ouse, which conveys the highland waters of the counties of Huntingdon, Cambridge, Bedford, and Buckingham, as well as the waters of the Bedford Level, to sea by the port of Lynn. This frightful catastrophe was occasioned by the late violent gale, accompanied by an unusually high tide. The breach is situate in the parish of Magdalen; it took place early on Thursday morning, and has excited the most serious apprehensions, the safety of many thousand acres of fertile land being dependent upon the security of the banks of this river. The extent of the breach through which this water was rushing is not less than 140 yards.

## AGRICULTURAL REPORTS.

### OXFORDSHIRE.

The weather through the last month has proved variable, sometimes frost, at other times rain, but not in abundance; on the 29th ult., and on the 2nd inst. we had heavy falls of snow, which melted gradually, otherwise we should have seen a high flood, as it was, the meadows were partially, though not entirely flooded, and for the first time this season. The severe frost we experienced at Christmas has cut up vegetation rather severely, and the wheats are looking extremely bleak in many situations; upon the whole, we do not consider this crop as looking by any means prosperous; but much will depend on the weather during the two succeeding months; at any rate none will require to be eaten down or mown off this season.

The crop of Swedes proves every day to be worse than we could have supposed, when the grub injured the bulb, great numbers have rotted (a very unusual thing for this crop.) Altogether, we never remember any thing like so failing, and we may almost add, when compared with former ones, so worthless a crop; the loss is beginning to be severely felt—artificial food is obliged to be had recourse to in order to make up the deficiency; notwithstanding, on account of the wool bearing a good price (two guineas per tod and upwards,) store sheep sell better than could have been expected. Beef and mutton

are scarce, so much so, that butchers have some trouble to meet with the number of animals they require for their customers. Wheat has at length taken a start, prime old, yesterday, making 6s per bushel. We have in more than one preceding report ventured to predict that in consequence of the quantity of straw required to produce a bushel of wheat, the supply must fail, and an advance in price be the consequence. We have had no import of wheat from the continent for many months, and but little lately from our neighbours the Irish; yet there is no want of wheat in the country, therefore we consider we are fully borne out in the statement we have so repeatedly made, namely that the soil of the United Kingdom was fully adequate for the supply of our population, even if it was much greater than it is. Now what will those garrulous writers and wiseacres say to this, who have been crying out that it was quite necessary to have a regular import of foreign corn to make a sufficient supply to meet the wants of the consumers? We might adduce the fact that some thousands of quarters of wheat have been, and are now, given to cattle of all descriptions; but enough has been said to prove the folly as well as the consummate ignorance of those pretended alarmists. We trust this fact of the country being able to maintain its inhabitants, will be steadily proved before the committee now sitting; and that practical

men will be summoned to give evidence out of every county in England.

#### BEDFORDSHIRE.

During the months of winter there is little to report concerning cultivation which affords us much pleasure to communicate, or which can excite any interest with our readers in receiving it at our hands.

We have had this year a good full portion of real winter weather, though not upon the whole scarcely a usual quantity of rain. The frost, however, has sometimes been intense, and for several days back the wind has been blowing pretty severely from the north north-east; so that vegetation may generally be considered to be very backward, the young wheat making but little show while the tares and clovers are less discernible than in the autumn. The turnips throughout have been a bad crop, and what few are left are fast rotting upon the ground, the purple top kind in particular. Our farmers are, therefore, put to great inconvenience in keeping their sheep, and to a cost for artificial food, which they can ill afford. The consequence will be, that while the consumer considers he is put to a high price for his meat, the grazier of mutton will have great difficulty in getting half remunerated for his immense outlay.

The winter, upon the whole, must be considered rather favourable than otherwise, for the greater part of the land of this county, and farm work is pretty forward, the early kind of oats being chiefly sown, while great progress has been made in dibbling and drilling the beans and peas, and if the present dry weather should continue, some of our farmers will be induced to sow barley even before this month terminates. Perhaps it is full early if we could secure sufficient dry weather in next month for the operation, but of late years February has produced more fine weather than March, and of this crop, in particular, the manner of putting it in is of more importance than the exact time, providing you are not late, against which (if quality is to be regarded) every effort should be used.

Our farmers vary much as to their statements concerning the relative good properties of the Chevalier barley; most, however, are agreed that it does not produce equal to the commoner sorts, and that they consider themselves by no means compensated for the deficiency of crop by the increased price which it commands. Others, however, (and especially those situated upon the unkind soils for quality,) most adhere to the Chevalier stock.

Wheat has gone up from its extreme depression about 1s per bushel, but is still far too low to be at all remunerating to the grower, and it is now too late for any improvement in price to do any material good to our most needy tenant-farmers for this year, and our fear is, that many of them are gone past all recovery.

We most sincerely congratulate however, the farming public upon one other effort being made to obtain a redress of grievances from parliament, either by obtaining some mitigation of the severe and grossly unjust restriction of the currency, or by the removal of those burdens which now press so unfairly upon agriculture: our own conviction is, that agriculture may and ought to be relieved from both these sources. At any rate, the efforts which are now making will put some of the consistent Whigs, and the pledge-breaking Tories, once more to the test, and we trust that the eyes of the whole country constituency will be kept upon them.

#### NORTH RIDING, YORKSHIRE.

I am glad to say that we are beginning to improve in spirits, prices are rather improving, not that I wish to hunger the poor, far from it, neither do I wish to be ruined myself. I have no doubt but the creditors of the farmer have been watching him some time, particularly the joint-stock banking companies, who have such extensive means of knowing his circumstances; but now, as prices are rising, and that government have condescended to pay some attention to the *greatest interest of the state* (*what a condescension!*) I hope we shall do better. I have read with much interest the parliamentary debates. Was much pleased to find that the Marquis of Chandos and Lord J. Russell were determined (at least to all appearance) to put *party* out of the question. Now this is as it should be. Farmers, manufacturers, Tories, Whigs, Radicals, are we not all Englishmen? then why should one party wish to ruin the rest; but it appears that some think that the principal relief must come from the landlords. I think not, though I have not one yard of land that I can call my own; and, if you knew me, you would believe me, when I say that I ask no favour of any landlord. I am sorry that they have not done justice to their tenants during those depressed times; in too many cases they have been too much occupied, to attend to the wants of their tenants. There are many exceptions; but then, why should the landlord reduce his rents, and the cotton spinners &c., not reduce their profits (I do not mean the operatives, their masters will take care of that?) I read in the *York Herald*, that a certain colonel said that the difficulties of the farmer was owing to their being too extravagant, living as they did during the war. Now I would ask the colonel, how he would like to be brought down to a sergeant during peace; and does he not think that farmers wish to keep their places as well as he does. No, my brave colonel, let us all advance. I do not like retreating, whatever you may. I also noticed in your paper a letter recommending a fixed duty on corn of 16s per qr, instead of the present scale. If your correspondent had said 20s, we should have agreed; but the corn laws should not be so often agitated, it causes the farmers to become too much addicted to politics (myself an instance,) instead of minding our farms. I am quite convinced that if there was a law enacted, that there should not be one bushel of any kind of grain imported into England, and that every encouragement should be given to improving farmers, we should be an exporting country. How many acres of waste land are there that would pay for cultivating, and how many are there ready to cultivate them? how many are there going to America, &c.? These are questions which ought to be studied by our rulers, instead of who are to be in place.

We have had a very mild winter, so far, which is rather extraordinary, as I understand that there has been a great fall of snow southward. Turnips are likely to be sufficient for the stock. The quantity of stacks in the stack-yards are a full average number at this time of the year. The money in the farmers' pockets very little (I judge by my own.) Beef and mutton are advancing. Good horses are high priced. Labourers wages the same. Farmers means of paying them rather lower.—Feb. 17.

GENERAL AGRICULTURAL REPORT  
FOR FEBRUARY.

This month commenced with its wonted characteristic humidity. During the first ten days, the atmosphere was either foggy, misty, cloudy, or shedding at intervals, drizzling rains; and occasionally, between these short periods, evanescent afternoon sunshine; subsequently, however, the weather has been the most March-like of that of any February we—who have entered our grand climacteric—recollect to have ever before witnessed. Hence, as even the misty showers were not sufficiently heavy to materially impede the progress of tillage, ploughing, and sowing of oats, and other Lent seeds, have, with other field labours, proceeded to a much greater extent, than has been usual, in this month; whilst the growing wheat plants plant well, and are described as being, though not exuberant, strong, healthy, and otherwise manifesting a promising appearance, and the whole range of green vegetation—with the exception of there being, in Norfolk, and some other districts, complaints of a scarcity of winter turnips: as displaying, for the time of year, an unusually fresh and animated appearance. Depastured sheep and beasts, the ewe flocks, bullock herds, and live farm stock in general, are also described as unusually healthy, and doing well, with much less than an ordinary quantity of fodder, so that, as far as relates to his tillage, the general promise of his wheat crop, or the health of his live stock, the farmer has not much cause to complain. Of sheep rot, we have no complaint whatever. Notwithstanding, however, these favourable circumstances, and that the currency theorists are trying to persuade farmers that a ray of hope glimmers for them, in the agricultural atmosphere, through his Majesty's speech to parliament, the delusive pretensions of a Central Association, its late meeting at Freemason's Tavern, &c., there is, as many of them seem to be aware, still a gloomy mist before their eyes! The discerning part of them, indeed, seem to be willing to dispense with all legislative interference—except a wholesome commutation of tithes, and other church exuberances—the whole of which they one and all seem to wish to be wholly abolished, and the clergy to be liberally subsisted out of the general taxes, rather than depend upon the theoretical interference of a parcel of currency doctors! We have read, in the course of the month, both in the *Norwich Mercury*, and, indeed, several newspapers, and other periodicals, accounts of an agricultural meeting, held at Lynn, on the 26th ultimo, not attended, at its commencement, by more than 120 persons, composed of both landlords and tenants; and whom the editors asserted, “at no time numbered 200!” This meeting, we regret to intimate, like many others that had preceded it, seemed to be too much mixed up with the currency question, whilst the violence of some of the speeches—especially those of Dear Wood, who did not seem disposed to content himself with making one speech—was represented as clamorous in the extreme. “Can you”—he was said to have asserted, while addressing the meeting—“can you show one year since 1815 that you have not clamoured? You then had a protecting duty of 21s 6d, when wheat was 63s per qr! There,” he subjoined, “is the point; and where stands the man that will say I am not on sound

ground? What was the late corn law,” he continued, “but a prohibition, and a good one it was said to be! But what was its effect? Why, the moment the corn came above a certain price, the foreign merchant poured his grain into your market, and, for a long time, swamped it. You,” he added, “had better been content with the old law. But how has that law worked, in operation? Why by a fraudulent average, in this very town. A merchant here returned that he had bought 200 quarters of wheat at 32s per quarter, whereas he had only bought 11 quarters at 18s, and another returned that he had bought 121 quarters, whereas he had bought none!” These were certainly, if true, fraudulent transactions; but, with all deference to the Dean, we do not recollect the prices of sound wheat to have been so low as 18s per quarter, at any period of the present century. We, however, conceive that agricultural prosperity is rather to be revived by the mutual concurrence of landlord and tenant, to the valuing system, according to the nature of soils, state of roads leading to and from market, local prices of produce, &c., than by any other legislative interference, except the abolition of tithes, and allowing the clergy a respectable subsistence out of the general taxes!

There has been, too, a ridiculous farrago going the rounds of the newspapers, in the shape of an extract from the *Edinburgh Review*, which signifies that the supplies of corn and other raw produce from Ireland, are not quite sufficient to provide for the greatly increased—instead of, by the use of steam, decreased number of horses kept in the country; seeming to take no notice that the cause of the depressed price of wheat is an increased consumption of the potatoes sent from Scotland to England, and that this farinacious vegetable has, with the aid of hard pudding, or dumpling, nearly superseded the use of bread, on the dinner table of the humbler, and a very great proportion of the middle classes of society.

“In an answer to a letter of Mr. Eyers, written by Mr. Coke, in January, 1821, we find,” says the *Norwich Mercury*, of the 5th of Feb., current year, the following passages. “I conceive that my agricultural friends,” says the venerable Osiris of Norfolk, we might have said of British tillage, “mistake their own interest, in calling for protecting duties, by way of remedy, for the distress under which they labour. I am more than ever convinced that nothing can avail but a diminished expenditure and its natural consequence, diminished taxation. The efficiency of these protecting duties is no longer matter of theory. They were laid on in the latter part of 1818, since which the market has been your own; yet what have they done for your prices? If the abundant produce of these realms,” he subjoins, “be capable of receiving a direction to the mouths of our abundant population, then has Lord Liverpool rightly considered us as justly punished for our industry; and Lord Sidmouth wiser than all the great sages of Antiquity!” Again, as the Editor of the *Norwich Mercury* said, in the course of the month, “We are not combatting the general feeling. We are desirous only to have the landed interest, especially the tenantry, exempt from the disappointment, attendant on absurd propositions. Parliament can do but little for agriculture, if to raise the price of its commodities be its object. If not, down must come rent, and its fixed elements tithes and taxes.”

As relates to the month's value of farm-produce, the prices of both fat stock, most kinds of corn, as also hops, poultry, and dairy-produce, have been looking a little upwards, whilst those of milch cows and horses have been a little on the advance: of hay and straw about stationary.

The following is a brief retrospect of the supplies and prices of Smithfield cattle market, from the commencement of the year to the 22nd instant:—

The following is, as nearly as can be ascertained, a statement of the numbers of beast sent to Smithfield, from different sources, from the commencement of the present year, to the 22nd instant inclusive—*via.*, St. Alban's road, 4,500; *via.*, other northern roads, 3,590; from Norfolk, with a few from Suffolk, Essex, and Cambridgeshire, 6,350; from the western and midland districts, 2,010; from Scotland, 990; from Sussex, Surrey, and Kent, 320; and most of the remainder, the numbers of which cannot be accurately ascertained, on account of their not entering the market in regular droves, from the stall-feeders, marshmen, &c., near London.

From the commencement of the year, till the grass-fattened sheep are out of their wool, the sheep and lambs are sent, in about equal numbers, from the southern parts of our northern districts, from Norfolk, Suffolk, Essex, Cambridgeshire, Kent, Sussex, Surrey; by the sheep-feeders, near London, and our western and midland counties.

The butchers complain that the Norfolk beasts have hitherto, this season, carried less internal fat, consequently come lighter to the scale, than has been usual at this time of year.

The Smithfield annual supply, on the average of five years, has consisted of about 163,837 beasts; 1,369,229 sheep; 26,000 calves; and 34,000 pigs.—The estimated annual value of fat stock, sold in Smithfield, is £5,230,000!—Feb. 24.

### HEREFORD AGRICULTURAL SOCIETY.

The meeting of this Society, on Monday Feb. 8, was numerously attended. The show of bulls was splendid. For this exhibition Mr. Charles Bulmer had kindly allowed the Society the use of a meadow, in front of Moorfield Place. This meadow is admirably adapted for the exhibition having two of its sides fenced with large palings, along which the respective stocks exhibited were arranged: so that the spectators on the

outside had excellent views of the animals. We would suggest, however, that should Mr. Bulmer repeat his kindness on future occasions, it would be more satisfactory to the farmers, if the animals were to remain in their situations for an hour after the judge had gone round, as we heard several of our county breeders regret, that from the Beasts having been moved off directly after the judge left the field, they had not had an opportunity of *touching* the animals. The exhibition altogether was very fine, the different animals eliciting the admiration of the spectators, particularly of the Agriculturists. The attendance of the company at an excellent dinner at the Hotel, was, as usual, very full, and it was determined not to join the Central Agricultural Society in London; we regret to state that P. Jones, Esq. of Sugwas, intimated the funds of the Institution were far from adequate to the expenses, and we hope the hint will cause an immediate accession of subscribers to the society. The successful candidates for the Premiums, were announced as follow:

1. Best Yearling Bull, prize value 5 guineas, to Mr. T. Yeld, of Broom.
2. Second best Yearling Bull, prize value 3 guineas, to Mr. John Walker, of Burton, but he having gained the second prize last year, was disqualified.
3. Best Two-year-old Bull, prize value 5 guineas, to Mr. John Bate, of Elsdon.
4. Best Three-year-old Bull, prize value 5 guineas, to Mr. John Morris, of Stockton.
5. Best aged Bull, prize value 5 guineas, to Mr. William Williams, of Cowarn Court, but Mr. Williams being said to be disqualified, the judge certified that the next best was that of Mr. W. Stedman, Bedstone Hall Salop; the committee however have yet to determine whether Mr. Stedman was qualified or not.\*
6. Best cart stallion, prize 5 guineas, to Mr. W. Vevers, Yarkhill; the cup to be delivered next Michaelmas, on proof that the horse has been constantly used during the present season in this county; a second horse exhibited by Mr. Vevers, was much approved of. In addition to the above successful candidates, the bulls sent by the following amongst our eminent breeders were deservedly admired: Mr. J. Adams, Mr. T. Fowler, Mr. T. Galliers, W. C. Hayton, Esq., Mr. J. Hewer, Mr. T. Jefferies, Mr. J. Lewis, Mr. J. Morris, Mr. J. Matty, Mr. C. A. Mason, Mr. M. Newton, Mr. W. Palmer, Mr. Perry, Mr. Price, Mr. Roberts, Mr. Stedman, Mr. Tully, Mr. Turner, Miss Tomkins, Mr. R. Yarworth, Mr. Yeld, &c. &c. The awards of the judge, Mr. S. Scotson, of Liverpool, gave universal satisfaction.

DEATH OF A FAMOUS WATERLOO HERO.—On the 12th day of February died at Strathfieldsaye, of old age, Copenhagen, the horse which carried the Duke of Wellington so nobly on the field of Waterloo. He was foaled about the time of the battle of Copenhagen, from which he got his name, and was remarkable for gentleness and spirit united. He lost an eye some years before his death, and has not been used by the noble owner for any purpose during the last 10 years. By the orders of his Grace a salute was fired over his grave, and thus he was buried as he had lived, with military honours. This horse has long been a great attraction to strangers, who were accustomed to feed him over the rails with bread, and the Duke himself preserved an especial regard for him, which cannot be wondered at upon considering that he bore him for 16 hours safe through the grandest battle that has occurred in the history of the world. The late amiable Duchess was likewise particularly attached to him, and wore a bracelet made of his hair.

\* The following is a Copy of the Judge's Certificate:—“ Being requested by the Stewards and Committee to state, which aged bull of the number shown at the Hereford Agricultural Meeting yesterday, was entitled to the prize, as Mr. Williams' bull, No. 2, is said to be disqualified, I do hereby certify, that in my opinion the bull, No. 10, is entitled to rank as the next best to Mr. Williams'.” SAMUEL SCOTSON.  
Witness, Thos. J. Bell.—Dated February 8th, 1836.

## REVIEW OF THE CORN TRADE DURING THE MONTH OF FEBRUARY.

During February the wheat trade throughout the leading markets of the kingdom, have exhibited a degree of animation, that has not been witnessed for many months; indeed agriculturists generally, in addition to the improvement realised on the principal commodity of their produce, have experienced another cause of excitement, originating in the formation of numerous agricultural societies, and have thus had various opportunities afforded them of partially dissipating and relieving the gloom and depression, under which they have for so lengthened a period laboured. Respecting the ultimate benefits, which the tenant farmers are likely to receive by the institution of agricultural meetings, for the express purpose of seeking redress from parliament, and a mitigation of those burdens now oppressing them, we have before avowed ourselves extremely sceptical, and the opinions often expressed on the subject have been fully substantiated by most of the speeches delivered in the Houses of Lords and Commons, on the appointment of the agricultural committees. Though this object of obtaining relief from the legislature, may be thus rendered abortive, yet we trust the societies will be still upheld, and eventually prove, by more sensible and legitimate means, advantageous to agriculture, in promoting an improved system of cultivation, as the depreciation in the value of the produce of the land, can be alone counteracted by corn tithes, corn rents, or a fair adjustment of rent equivalent to the receipts, and by a scientific course of tillage.—that is, a chemical analysis of the soils, and the adaptation of appropriate manures, by a persevering system of draining, especially of tile-draining, and by giving fresh and renewed vigour to the exhausted superficial soils, by trenching, and causing the earth to teem with more than two, aye, threefold, the abundance, than has been reaped from the previous system of culture. This is no visionary notion of the land possessing the embryo power of yielding a much higher average rate of produce, than is at present returned, for if proofs were really required, among the many which might be adduced, is the instance of the experiment made some years since by the celebrated French chemist, *Lavoisier*, who cultivated 240 acres of land, in La Vendée, on chemical principles, in order to set a good example to the farmers, and his mode of culture was attended with so much success, that he obtained a third more of a crop than was yielded by the usual method, and in nine years his annual produce was doubled. The application of chemical knowledge to agriculture, has in this country been almost totally neglected, though the most valuable agent which the agriculturist can possibly acquire. Analytical chemistry will teach him to appreciate the real value of his farm, to turn every acre to the best account, and by transporting and transposing the different soils, how each may be rendered more productive. The analysis of the soils will be followed by that of the waters, which may spring from, or flow through, his land; and he will discover those best adapted for irrigation. The peat, the marl, the lime, and other manures must be sub-

jected to the same experiment, before he can avail himself of the advantages which might be derived from them, or before he can be certain of producing any particular effect. The necessity of analysis to the farmer, is evident from the trite knowledge of the circumstance, that some kind of lime is injurious to land, and would render land hitherto fertile, actually sterile. Besides, a knowledge of the first principle of chemistry, will teach him when to use lime hot from the kiln, and when slacked; how to promote the putrefactive process in his composts, and at what period to check it, so as to render the fertilizing qualities most effective; exhibiting likewise, the difference in the properties of marl, lime, peat, dung, mud, ashes, alkaline salt, sea-water, soap-waste, oil cakes, animal matter, &c., and consequently which are most suitable for the different kinds of land. Thus we have endeavoured briefly to point out a few of the leading facts, exemplifying the high import connected with a knowledge of the chemical properties of bodies: it would in truth be discovering to the agriculturist a *hidden treasure*, and conferring upon him a new and distinguished character; and our country gentleman, as has been observed by an intelligent writer, “instead of devoting themselves wholly to the fowls of the air, and the beasts of the field,” would be qualified to cultivate their estates upon scientific principles, and to enjoy their retirement with philosophic minds.

The supply of Wheat from those counties, which usually export to the London Market, have been, during the past month extremely limited, exhibiting a deficiency as compared with January, in which the importations were also very moderate, of 4,500 qrs, and compared with December a diminution of 21,000 qrs. The speculative attention attracted towards wheats, as noted the previous month, has continued throughout February, which in addition to some orders for shipment to the North, and the short stocks of the millers compelling them to come upon the market, has caused a very favourable change in the aspect of the trade, briskness, instead of the usual dulness, having characterised the proceedings of the principal market days, enabling factors to realise an advance of 6s to 7s per qr., on the finer qualities, and 4s to 5s on the secondary and inferior descriptions; and clearances generally effected at these improvements. An opinion however, appears to prevail, that the speculative feeling in favour of wheat commencing thus early in the year, while the stocks are still large, and the season not sufficiently advanced to offer any criterion to judge from as regards the growing crops, that the article is likely to be affected too much by increased supplies, to render much chance of the enhancements of the currencies being maintained, and that speculators are not likely to follow up the advanced quotations; as the falling off in the imports, is not to be attributed to want of stocks, but that the bulk of wheat now held, is in the hands either of larger farmers or merchants, who have in their power to refrain from bringing their samples to market, and thus a temporary diminution is experienced in the London, as

well as the country markets, where prices are dependent, in great measure, on the currencies realized in the Metropolis. Much life has also prevailed in bonded wheat for shipment to the United States, the American currencies still continuing to rule high; the accounts of the weather, and state of crops from also New South Wales being extremely unfavourable, a few small cargoes have been exported to that distant part of the world. The principal shipments have been about 6,100 qrs. to Baltimore; 1,800 qrs. to New York; 600 qrs. to Philadelphia; 2,800 qrs. to New South Wales; 1,900 qrs to Van Diemen's Land, and 2000 qrs to Marseille. The offers have been generally low, and principally confined to the lower Baltic red wheats at 24s to 26s; and 28s, 30s, to 32s for Danzig. Holders, however, as the demand has improved, have increased their demands, and the bulk of the exports have therefore been on owners' account; samples are now for the most part, either withdrawn from the market, or the rates asked are much higher than the offers. Speculators having waited already to so protracted a period, are now willing to await the issue of events, than to submit to the heavy loss which must be even at present made in order to realize.

The improvements in the wheat trade has enabled millers to advance the price of flour; town made qualities being noted at 40s to 42s, which shows a rise of 1s per sack, and country marks have increased in value 2s to 3s per sack. The supplies of flour-coastways have been on a very limited scale, being upwards of 5000 sacks less than during the month of January, and 15,000 sacks less than December. Bonded flour has experienced much enquiry, but there are few parcels offering, and prices have advanced fully 1s per barrel; from 2000 to 3000 cwts. have been shipped to New South Wales, and 600 to 700 to New York, besides 1000 to 2000 cwts, to the Mauritius; from 18s to 23s per barrel are the prices paid according to quality.

The averages have sustained little variation, the duty on Wheat has declined 2s per qr. On barley, 1s 6d, and the same amount on oats, and has advanced 1s 6d per qr., on rye and peas.

Though the supplies of barley have been moderate and less than last month by 7,500 qrs., yet the trade has been dull and languid: the brewers at the close of January got well into the stock of malt, which caused malsters to be generally shy of purchasing, Chevalier qualities in consequence have receded 1s per qr., and common malting runs 1s to 2s, but selected parcels of the former description of barley towards the end of the last month experienced a demand at steady prices. The distillers have purchased several parcels at the decline of 1s 6d per qr., but in grinding descriptions there has not been much business transpiring and prices are nominally unaltered. Bonded barley has met some speculative attention, and 3,000 to 4000 qrs have been bought for shipment to the United States at 13s 6d to 14s.

The large brewers having refrained from purchasing, the malt trade has continued heavy at a decline of 1s per qr on all descriptions.

The supply of oats from our own coast, has exceeded that of January by 5,800 qrs, while from Scotland the arrivals are nearly 1,000 qrs less, and from Ireland a falling off appears, amounting to 31,100 qrs, making a total diminution during the month, of 29,500 qrs. And in comparing the importations of the article since harvest to the present period during 1834-35, and 1835-36, it appears that we received from:—

Michlms. 1834, } to end of Feb. } 1835.	Engsh. } } qrs.	Scotch. } } qrs.	Irish. } } qrs.	Total. } } qrs.
	30,428	157,299	356,861	544,588

Michlms. 1835 }  
to end of Feb. } 79,331 49,133 216,982 345,446  
1836.

Exhibiting on the aggregate this season, a diminution of 199,142 qrs; having imported 108,166 qrs less from Scotland, and 139,879 qrs less from Ireland than last year, though from England there is an increase of 48,903 qrs.

In the early part of the month, dealers and consumers anticipating increased supplies refrained from purchasing, and the oat trade remained languid, though needy customers in some instances submitted to an advance of 6d per qr; towards the middle of February the arrivals augmented, but were met by a free demand, purchasers being out of stock, since which the trade has remained firm at an additional advance of 6d, making the quotations 6d to 1s per qr dearer than at the close of January. The material difference, which appears in the importation of oats this season, would lead to the inference that the stocks must be considerable both in Scotland and Ireland; as the agricultural banks in the Sister Isle have enabled farmers to withhold their produce for the present, in hopes of a further rise in the prices, which are already higher in proportion than our quotations, the rates demanded free on board being 10s 6d to 11s 6d according to the distance of the ports; Galway's have been sold at 9s to 9s 6d per barrel. A partial enquiry is experienced for oats in bond to ship principally to the West Indies. Stale qualities have been sold at 9s; good Danish, Swedish and Russian are worth 11s to 12s. Friesland 12s to 15s. Brew 14s to 15s.

Old Beans are extremely scarce and would realise the top quotations. New qualities have proved saleable, and at the commencement of the month obtained 1s per qr more money, which improvement they have maintained.

White peas have sustained little alteration either in price or demand, and maple have supported their previous quotations; but hog peas are 1s per qr lower than in January.

During the month of February the following quantities of Grain and Flour have arrived in the Port of London.

	Wheat. qrs.	Barley. qrs.	Malt. qrs.	Oats. qrs.

In France the principal grain markets have maintained a very steady appearance, and as the better qualities of Wheat are scarce, advanced rates have been in many instances realized. In places the scarcity of good samples is accounted for by the stores in the barns being exhausted; some farmers not having yet taken down their stacks, and those who have, are bringing to market that portion of the grain which has been more or less affected by the

weather while in the rick ; secondary and inferior qualities therefore are now forming the bulk of the samples offering. Little credit seems attached to the conflicting reports regarding the progress of the young wheats, the impression being that they are for the most part exaggerated, and that the season is not far enough advanced to form an opinion of sufficient probability to influence the currencies : the fields in various districts present a more favourable appearance than last season, as weeds are not seem striving with the wheat plant, and threatening to choke it in its growth. In the southern departments wheat continues at remunerating prices, and induces the shippers still to export from the western parts of the kingdom. At Marseille, the law prohibiting the manufacture of the Barletta wheat into flour for export has given considerable umbrage to the merchants, as the Odessa wheat, which is now used, produces an inferior quality of flour, and requires admixture. Owing to these new restrictions, the Neapolitans are availing themselves of the advantage and exporting to Algiers Barletta flour. The quality of the Barletta wheat is decidedly superior, and might be grown with advantage in our own country. At Grignon, in France, successful experiments have been made in its cultivation, and the samples are fine, and realizing 36 francs the 1½ hectolitre, or about 53s 7d per qr for seed, the top quotation at Paris for native qualities being 24 francs, or about 35s 10d. M. Bella, director of the experimental farm at Grignon, announces that he has a summer, as well as winter Barletta wheat, both qualities of which may be depended upon for their growth.

The prices of grain in the Italian markets have sustained little variation ; all the speculative business has been transacting at Naples, where wheat and oil are articles of speculation, in some degree similar to the funds on the Stock Exchange, otherwise the demand for Barletta wheat has been confined to the local wants, with the exception of the export of some Barletta flour to Algiers. At Leghorn rather considerable sales appear to have been effected during the past month, white Tuscan wheat being noted at 39s 5d, red ditto at 32s to 35s 6d. The wise and politic measures adopted by the government of Tuscany, in remitting the duties on the import of foreign goods, is represented as having had a very beneficial effect on commerce, and reviving the mercantile importance of the city. At Genoa the transactions in grain were confined to the local wants. The market at Trieste has supported throughout the month the former quotations, though crushing seeds had partially receded in value, owing to the decline in the price of Olive oil. Italian and Banato wheat was noted at 26s to 31s 3d per qr.

From Sydney the reports are extremely unfavourable of the state of the crops, the long-continued drought having, at the date of the last advices, destroyed all hopes for the harvest ; wheat had advanced to 13s per bushel, and at Launceston and Hobart-Town the markets, owing to the unfortunate state of the agricultural expectations in New South Wales, had further improved in price, extensive purchases having been made for shipment to Sydney, at 10s to 11s ; many holders of wheat, however, would not accept even 11s 6d per bushel, as they anticipated a further enhancement in the currencies.

In Canada the prices of Wheat remained firm at 4s 6d to 5s 6d per minot for Lower Canada red, of Upper Canada quality there was none offering ; Flour realized 30s to 31s per barrel, superfine. The farmers in the interior country markets were obtaining remunerating rates owing to the demand on the part of the Americans, not only for Wheat, but also for Barley.

In the United States the inland water communications were generally re-opened, but the supplies had only been moderate of grain and Flour. At New York, Flour had advanced, and common to good brands were noted at 33s 1d to 33s 9d per barrel. There had been no arrivals of Wheat and the only quotations was that of North River quality at 48s ; Genesee of best quality having obtained 53s 2d to 55s. Some Rye had been received from Rotterdam, which obtained 36s 3d ; Cloverseed was dull, and ¼ d to ¾ d per lb cheaper. At Baltimore, Wheat was noted at 52s 5d to 53s 2d per qr, and Flour 30s 4d per brl.

At St. Petersburg the grain trade was dull, and by the advices received from the interior, as to the crops, it appeared there would be sufficient grain for the food of man, and sufficient feed for cattle ; and therefore no probability existed of the port of St. Petersburg being re-opened for the free admission of foreign grain. Linseed met with less attention, but was held at 42s 10d for best qualities. At Riga considerable purchases had been made of Linseed for English account at 40s, 41s to 42s. In grain nothing transpiring. At Danzig, prices of fine high mixed Wheats have rather improved and the superior qualities of 1834 comparatively scarce, being noted at 29s, new do 28s, and the stocks limited, but of older Wheat, good weighing 61lbs, and of useful quality, but colour rather faded, there were a good many samples on hand, which might be bought much lower. There does not appear much chance of the Vollynian samples being obtained under the present current prices, as the holders have been at considerable outlay in storing, &c., and the transport has become hazardous and expensive, the Insurance Offices having refused to insure cargoes in the flat bottomed country barges. In the Lower Baltic ports the grain and seed trade has sustained no variation, previous currencies being supported. In Holstein and Denmark the Rape plants have been much affected by the weather. At Hamburg, with the exception of the purchase of some parcels of Upland Wheat, ex-granary, for manufacturing into Flour for export, there was nothing passing in the grain trade. Beans had found purchasers at 13s 6d to 20s. Cloverseed firm, as the stocks are small, and when the demand commences for the consumption, there will be little left of good quality for export ; a parcel which had been shipped from Bohemia, and was on its passage down the Elbe, has been countermanded and re-freighted to Prague, the supplies for the local wants having become so limited.

LIVERPOOL.

WEEK ENDING FEBRUARY 20.

ENGLISH WOOLS since last week have improved in value, and the demand at present exceeds the means of satisfying it. This has consequently induced holders to ask the best prices, the annexed quotations being fully supported. Combing fleeces, 18d to 18½d per lb; Down ewes and wethers, 17½d to 18½d; ditto tegs, 20d to 21½d; super. skin, 17½d to 18½d; head ditto, 14½d to 15½d.

SCOTCH WOOL.—There has been a farther advance in the value of Highland Laid Wool this week. Several parcels have been sold towards the latter end of the week at our highest quotations. The transactions in Cheviots, although inquired after, (from the lightness of the stock,) has been trifling, at rather better prices.

# THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

[Our object in appending a Political Companion to the Farmer's Magazine, was to put our readers in possession of the opinions of the most talented journalists of the day, on *both* sides of any important question which might come under discussion. We trust, therefore, that in giving insertion to articles, which seem opposed to the agricultural interest, we shall not be considered as acquiescing in the doctrines therein advanced, our sole purpose being to enable our readers to estimate the truth or detect the fallacies of the arguments advanced.—ED. FARMER'S MAGAZINE.]

### THE AGRICULTURAL COMMITTEE.

(From the *Morning Herald*.)

Without indulging in any Utopian schemes for bringing back their golden days of vanished prosperity to the farmers of England, we have from time to time pointed out some of the means by which the deep and extensive distress that now afflicts the agricultural classes might be in some degree alleviated. In doing so we have not proposed that in relieving the interests of one industrious society that government should sacrifice those of another. In truth, the interests of all classes of the community, though to the eye of superficial observation distinct, are so intimately interwoven and blended with each other, that the injury inflicted upon any one of them extends, by a sort of social sympathy, to the rest. The distress of the landowner affects the tradesman; the profits of the shopkeeper suffer from the poverty of the farmer. In the failing resources of other classes the useful industry of the mechanic, the ornamental talents of the artist, and even the learning of the scholar, receive less encouragement and reward. The whole fabric of society is one of mutual dependence and mutual support from the solid foundations to the high and glittering pinnacles.

Agricultural industry is only despised by those who are themselves of mean and despicable intellect. That industry is the root of all the rest. The learned Thebans of the modern school of political economy are accustomed to speak of the landed interest—of farmers, their understandings and pursuits, with pedantic superciliousness and flippant contempt. Yet mankind must have bread before books—subsistence before knowledge—the necessaries of life before its conveniences and embellishments. The agriculturist sows the acorn which, in course of time, furnishes the material that the ship-builder forms into the stately vessel to bear the bales of the British manufacturer over the seas, and to return laden with the silks of India, the spices of Arabia, and the gold of Ophir. To carry the produce of the plough as well as of the loom, commerce spreads her thousand sails upon the ocean—but our pseudo-patriots fling contempt upon the British plough, and treat the British farmer as no better than an alien in the land which his industry has enriched and adorned.

In a little work called "Reasons and Plans for the Encouragement of Agriculture," which is written with ability and good sense, and with no undue leaning to the agricultural interests at the expense of others, very different sentiments are inculcated from those with which the Gamaliels of political economy inspire their pupils. It is there said,—

"Every one who has a spark of patriotism in his soul, must wish to see the tillers of the soil—the peasant to supply our armies—the yeomen to protect our rights and liberties at home, prosperous and contented." How this patriotic object can best be effected has caused much variety of opinion among those who are sincerely anxious for the relief of the farming interests. For our own part, we cannot flatter the hopes of the farmers so far as to favour the presumption that it is possible, by the magic "omnipotence" of parliament, to let in a sudden tide of prosperity on the land which will run over sands of gold; but we have shown that something can be done in lessening the fiscal burdens which the farmer has to bear, especially in regard to local taxation. In the report of the Committee of the House of Commons of last session on county rates, the following passage occurs:—"The poor rate is heavier—the county rate is heavier, the highway rate is increased," and the evidence would lead to the conclusion that the outgoings of the farmer are larger than he can afford to pay during the present prices of agricultural produce. Hence it becomes important that parliament should watch with jealousy those burdens which are imposed by law on the land, and which it is within their competency to revise and modify. In the same report, as the little work which we have quoted reminds us, it is recommended that the county rate should be reduced by making it no longer liable to bear the whole charge of criminal prosecutions, but which should be paid out of those funds to which the general mass of property throughout the country contributes more equally than it does to the county rate. The highway rate it is proposed to reduce prospectively, and at the expiration of existing local acts, the roads leading to and over county bridges or turnpike roads should be repaired at the expense of their respective trusts, and, according to the report, for this reason, namely, "that the gross expenditure on highways in England and Wales is, in round numbers, one million and a half sterling, of which two-thirds are levied directly on the land. A fresh valuation of the property on which the county rate is levied is also recommended in all cases where no valuation has been made within the last fourteen years. The object is stated to be to make property in towns contribute in proportion to their growth in wealth and population, and so far relieve landed property and the farming tenantry from an undue pressure of the county rate." All these suggestions are good as far as they go. The relief they can afford must be partial and limited, but still it will be some relief. Along with these a better and more equitable arrangement of the land-tax—a commutation but not

a confiscation of tithes—and a poor-law for Ireland, may do much good; but the whole taken altogether, though tending greatly to alleviate distress, will hardly be sufficient to restore prosperity.

Another means of affording relief to the agricultural interests, to which we have alluded more than once already, is the placing a tax on Russian tallow, which would, as we showed on a former occasion, and as Mr. Handley since proved, in a speech that appeared in our columns, assist one branch of British manufacture, which is now in a declining state, by allowing the removal of the tax on soap, without any very sensible diminution of the revenue. In the debate upon the repeal of the excise on candles, we find the following observations of Mr. Hume recorded:—"I would suggest to the noble lord the expediency of taking off the tax on soap altogether, and imposing an additional duty on Russian tallow, by which we should prevent Russia from taxing England, as she now does, to the amount of 600,000*l* a-year, which might be put into the pockets of our landed proprietors without the least mischief—for to Russia we owe nothing." We do owe Russiasomething—we owe her our hatred and contempt for her cruelty to the brave people of Poland—for her violation of the faith of treaties—her perfidious and circumventing policy, and her most illiberal and restrictive tariff which she now extends to the frontiers of Poland; yet we pay her 600,000*l* a-year, that ought to go into the pockets of our own landed proprietors.

We need not here repeat the arguments which we formerly addressed to the public and the legislature upon this subject. A calculation is made in the pamphlet before us, of which we have only room to copy the results. They are as follows:—

"Excise duty on soap, direct and indirect £825,000  
From this deduct the proposed tallow duty 550,000

And the public will gain . . . . . 275,000  
The agriculturists will gain . . . . . 350,000

"The labourer will gain, by decreasing the expense of cleanliness, by the consequent increase of comfort and health.

"The manufacturer will gain by having an open trade, and the removal of the trammels of the Excise, and the total abolition of smuggling.

"And the revenue, by a transfer benefiting nearly every class in the state, will only lose 250,000*l* out of 1,500,000*l* surplus, and thus in all probability only a temporary loss, as the encouragement that would be given to foreign trade, from an important branch of which the manufacturers are at present excluded by the vexatious operations of the Excise laws, would very speedily replace so small a sum."

#### THE COMMITTEE ON AGRICULTURE.

(From the Morning Post.)

The appointment of a committee of the House of Commons to inquire into the situation of the agricultural classes, with a view to devise a remedy for the distress in which they are generally involved, is an occurrence from which the landed interest of England cannot fail to derive much gratification. The agriculturists have now a fair opportunity of showing, by evidence, that certain reductions of the taxes more immediately affecting them, which the Whigs refused to accomplish when they had an opportunity of doing so, would have prevented or greatly mitigated the distress under which they at present labour; and to this point, we respectfully suggest, their efforts ought principally to be directed. The

debate of last night must have proved to them that it is only by directing and confining their attention to practical measures, and by completely and at once throwing overboard all the systems of idle theorists, they can hope to obtain any measure of real and substantial relief.

The able speech of Sir Robert Peel claims the special attention of the agricultural body. The right hon. baronet is identified with them in feeling as he is identified with them in respect to his most important interests, and the doctrine which pervades his excellent address of last night is the same as he has always proclaimed, viz., that no distinct class of the community can rightfully claim that the general relations of society should be disturbed for their special benefit, or can rationally expect that their peculiar interests could be promoted by such a disturbance. Upon the subject of the currency, Sir Robert Peel is entitled to a degree of deference, greater even, if that be possible, than he could fairly claim on account of the perfect possession of the subject which his own talents and opportunities have enabled him to acquire. He represents upon this subject all the living statesmen of Great Britain—all the men, of whatever party, who have at any time been called to consider it under that awful sense of responsibility for the general welfare which high office only can impart, and with that extensive and universal information as to the various interests of the community which an elevated station in the government of the country only can afford. We trust, therefore, that upon this topic the committee just appointed will not waste its time. There are many subjects for its consideration which, if less comprehensive, are likely to be more productive of beneficial results. The system of taxation, for instance, as it affects the agricultural compared with other classes of the community; the peculiar pressure of poor-rates, county rates, and other local charges upon the owners and occupiers of land; the effect upon British agriculture produced by the absence of any legal provision for the poor in Ireland, the abject and impoverished condition of the Irish labourers, and the quantity of exportable productions reared upon Irish estates—all these are subjects well worthy of the attention of an agricultural committee, and calculated to occupy its attention fully, and to occupy it in a manner which will afford some prospect of results practically beneficial. From any theories, or any collection of theories, however complete, on a medium of exchange regarded by all competent judges as permanently and unalterably fixed, no practical consequences of any kind could be expected.

There is some reason indeed to think that the noble mover of the committee would not be very sorry to see it entangle itself in speculative inquiries of the nature to which we have alluded. Anything, we believe, would be more agreeable to the present ministers of the crown than the close and accurate investigation of questions of real utility. In saying this we do not mean to impeach the constitution of the agricultural committee, as appointed on the motion of the noble Secretary for the Home Department. It contains a considerable preponderance of men known to be identified by sympathy and interest with the welfare of the agricultural classes. The noble lord, however, permitted one to be added to the original number, without a division, to the committee he had appointed, and successfully resisted, by a majority of seven, the addition of three other names to that body. We institute no invidious comparison between the respectable gentleman whom the noble lord adopted as a member of his committee and the equally respectable gentlemen, whom he rejected, when we

mention that the former is known to entertain peculiar views in relation to the currency, and to be connected with the trading more than with the agricultural interests of the country, while the three latter—namely, Lord Darlington, Mr. Wodehouse, and Sir C. Burrell—have, so far as we know, no individual crotchets or special lobbies, but are eminent members of the agricultural interest. The facility of admission in the one case contrasts rather inauspiciously with the division of the house, and the victory, by a majority of seven, in the other; and the whole circumstances taken together would almost justify the suspicion that the noble mover of the committee would not be much displeased to witness the distraction of its councils and the frustration of its practical ends.

If such a scheme have entered into the imagination of his Majesty's ministers, we feel confident that it will prove abortive. The good sense and practical information of the committee, as actually constituted, afford a sufficient guarantee that such a project would certainly sustain a complete and disgraceful defeat.

#### THE COMMITTEE ON AGRICULTURE.

(From the Standard.)

The committee is appointed—appointed with full powers to inquire into the whole subject, in all its breadth and bearings; and though not precisely constituted as could be wished, still the presence of such members as the Marquis of Chandos, Sir Robert Peel, Sir J. Graham, Mr. Matthias Attwood, Lord Stanley, Lord Francis Egerton, the Earl of Lincoln, and a few more whom we might name, afford a pledge that the investigation will be prosecuted prudently and honestly; and from a prudent and honest investigation of their sufferings and their claims, the agriculturists of Great Britain have everything to hope, and nothing to fear. Let it be once shown to the people of England that so large and so meritorious a class of their countrymen are unjustly aggrieved, and to treat the grievance as beyond remedy, were to distrust the power or the will of the British nation to do justice—a diffidence, which we, at least, never have entertained, and never will entertain.

Notwithstanding that Lord John Russell had engaged to leave the committee wholly unfettered, as to its researches, and deliberations, and notwithstanding that the Marquis of Chandos had rivetted his lordship to the pledge by reciting it, and giving an acknowledgment in his thanks—notwithstanding this clear and satisfactory understanding Mr. Thomas Attwood was pleased to attempt giving, at least, a bias to the inquiry, by proposing an amendment to the effect, that the currency question should form a principal subject of the committee's consideration. Nothing could be more mischievous than this amendment, however it was intended. The currency question was not proposed to be excluded; therefore, so far as the change in the currency is connected with the distress of the agriculturists—and the connection is close, if not essential—it will properly come under the notice of the committee. But, we believe, that it were an unprofitable squandering of the committee's time; and, what is much worse, a giving a false direction to its pursuit to go further.

The change in the currency may have caused the distress of the agricultural class; but, it does not follow that to reverse that change would repair the evil. Compensation in such cases is not only easier, but more promising of effectual relief, than simple resti-

tion. However, it is unnecessary to argue this matter, because we believe, that in the present state of the public mind, and indeed, until every other means of restoring the agricultural interest shall have been fairly tried, without success, any interference with the currency is a moral impossibility. We may regret this, and we do regret it; but it were to be blind to the most common instincts of mankind, not to see that where the monied class—and the man who has saleable goods, or 100*l.* in money, or 100*l.* due to him, or the smallest sum in stock, is as much a member of the monied class as the *Millionaire*—will not consent to a measure of partial relief, confiscating, for the benefit of others, no inconsiderable portion of their wealth or capital. Whoever, therefore, directs the agriculturists to the restitution of a paper currency, rather than to a claim of compensation, in some other quarter, for their losses by the bill of 1819, renders them the sinister service of misleading into the road of disappointment from a path of possible, and even probable relief.

This seemed to be the universal opinion of the house, for Mr. Attwood could not find a seconder, and his amendment of course fell to the ground.

#### THE AGRICULTURAL INTEREST.

(From the Norwich Mercury.)

Our readers are not now to learn the studious, not to say the laborious attention, we have for so many years given to the concerns of agriculture. We trust we have established and confirmed in the minds of the landed proprietary, the tenantry, and the labourers, that we have their joint and several interests profoundly at heart. It is necessary to recur to these facts, because in the proceedings of the society calling itself central, which has sprung up in London, we think we read an attempt (abortive it will surely prove) to set up separate claims, and to dissociate rather than unite the several classes of the kingdom in a vain, however honest endeavour, to rescue from their depressed state the owners and cultivators of the soil; we use the word "vain" in reference to the means proposed by the society, for God forbid it should be so in any other sense; we read this empirical process in their proceedings and we wish emphatically, to divide the persons from their transactions, for it is impossible not to respect both the men and their motives. Earl Stanhope, who is in truth the head and fountain of the whole, is a nobleman of no mean capacity, alike earnest, industrious, acute, and upright. His views, we know, are most philanthropic. It is therefore with considerable reluctance that we can bring ourselves to demonstrate the faulty construction of a set of resolutions, bearing the signature of such a nobleman heading so respectable an association. But it is of the utmost consequence to the landed interest in its three classes, that the foundation upon which they build, should be laid thoroughly open to general inspection—that done, let the landed interest and the public at large be the judges, it is their own cause we plead.

We have then in the petition transmitted to us last week by Edmond Wodehouse, Esq., the manifesto of the society—the syllabus as it were of their lecture, the short abstract of their principles, which may lead us to apprehend their intended practice. Let us examine its contents.

The first clause declares the distress of the agriculturists. Is this all? No. It also declares that the distress has "arisen mainly from legislative measures, and not from causes which are beyond the con-

trou of parliament." This is difficult to disprove, because the averments are general. Had the resolution boldly denounced those which it is intended to cover not conceal, had it said, the adoption of a gradual scale of duty, admitting foreign corn at all times, and Peel's Bill have ruined agriculture, (which is we presume what is intended) there would have been tangible ground. But these disputable, not to say disproved points, the petitioners are too wary to disclose. The reservation is hardly fair and straightforward, but we must take it as it stands. We therefore say at once, the distress [*i. e.* the low price of wheat] has *not* "arisen from legislative measures," but "from causes beyond the controul of parliament."

We assert, nor do we fear contradiction, that the proximate cause of the distress of agriculture is to be traced to a supply more than equal to the demand. Observe we say the *proximate* cause. The causes of this cause are a succession of favourable harvests, and improved and extended cultivation in England, Scotland, Ireland, and the Colonies. Now we dare not, nor even do not aver, that legislative measures have not contributed to the prosperous agriculture of the Empire, but surely this effect furnishes no just ground of complaint? The country desires to see the Colonies, Scotland, and most especially Ireland, raised in the scale of wealth and comfort, which begins by increase of production. In this sense the petitioners are right, but this is exactly the opposite sense to that in which they wish to appear right. They wish to establish that the legislature has done mischief, not good, and it is in this they so egregiously fail in the outset. But to take the two postulates—the graduated scale and Peel's Bill. The experience of between thirty and forty years had proved a certain importation *indispensable* to the support of the population—indispensable to the *prevention of famine*. Fixed duties had been tried—first high and then low. What followed? Why a short home supply—high price for a short duration, opening the ports, and then a long and ruinous depression. This scheme obviously failed. The graduated scale was then tried, and though fluctuation, perhaps we may be justified in calling it extreme fluctuation, was not absolutely avoided, yet the price was steadier, until the plenty of the last three years threw down the price, irrevocably, so far as we have yet seen. The British and Irish grower and the English colonist have had the monopoly of the market, but supply exceeds demand, and nothing parliament could or can do, short of decreeing the exclusion or destruction of a portion of the crop, can give relief. And what has been the consequence to landlord, tenant, and labourer? Why an artificial and suppositious standard of value, never reached, has kept up an artificial but *real* standard of expences, rent, tithe, taxes, &c. which have drained the operative, the farmer's capital into other men's pockets, and disturbed and vexed all their several relations. The landlord is compelled not only to reduce, but subsequently to remit as a benevolence a part of his rent—the tenant is thus degraded, and the labourer is unemployed. Now had things found their level, that to which they are rapidly approaching—the level established by the immutable law of supply and demand, none of this would have occurred. The farmer, to use a phrase in the petition to which we shall presently come, would have "brought down the burthens (namely the expences attending a farm) to the level of the present prices," *at once*, not by driblets ruinous to himself without benefiting the other orders. This was the course we recommended at the peace

—this was the course we have ever since been urging—and this was the course which would have saved the agriculturists. Again reader observe—all that we assume, all that we take for granted is, that the legislature cannot, will not, dare not interfere to impede the agricultural improvement and progression of Scotland, Ireland, and the Colonies; and if it do not so interfere, the progression of an improved and improving agriculture will continue to feed the markets, in fair average seasons, to the utmost limits of demand.

Now then for the other measure—Peel's Bill. In our postscript of November 28 last we showed, that an increased circulation of paper could have little or no effect upon the price of corn. After so recent, and we hope so clear an exposition of the fallacy, there can be no occasion for us to go again over the same grounds. They are simply these—capital is superabundant—the banker will not lend to the farmer, because his trade is not prosperous, nor will the merchant speculate in English corn, because there has been little or no probability of a rise, and because foreign affords the best (bad is the best) chance. There is yet another truth which puts our position past controversy. A table has been constructed, we believe originally by the Editor of *The Mark Lane Express*, whose clear views and courageous assertion of them does him high honour—"showing the average prices of corn, and the average amounts of bank circulation from 1797 to 1832. It is well known that the circulation of country banks contracts and diminishes with that of the Bank of England, because they being liable to be called upon to pay their notes in gold or bank paper, must, of course, regulate their issues by the means they possess of obtaining those equivalents. From this table it appears that in 1801, the price of wheat was 5*l* 15*s* per quarter, and the issues of bank notes fourteen millions; in 1822, it was 2*l* 5*s* with an issue of seventeen millions; in 1824, 2*l* with twenty-one millions of paper. Thus the highest price was attained with the very lowest issue of bank-notes, and the very lowest with the largest. But on a further inspection of the table, it sufficiently points out the cause: the years of high price were years of a defective harvest, 1801, 1805, 1812, (when the price was 6*l* 5*s* the issue twenty-three millions), and 1817. If the quantity of issue were an effective cause, how happened it that in 1817 the price reached only 4*l* 15*s* when the issue was the very highest the kingdom ever knew, namely, thirty millions? and how did it occur, if Peel's Bill were an operative cause, that wheat bore the same rate in 1815, four years before it passed, that the same grain did in 1825, 1829, and 1832? How happens it that barley was last year so high, and wheat so low? What can account for the fluctuations of wool? Not the currency, but the simple state of demand and supply."

Thus we have demonstrated that the first position of the petition ends in what logicians call *reductio ad absurdum*—In plain English, that it is stark *nonsense*. To proceed—

That extreme distress may lead to convulsion we are but too ready to admit. That the continuance of distress will disable the distressed from paying taxes is also a truism; but it is a mere though a miserable truism. What must be the end? Why the reduction of taxation by means of the reduction of establishments. Amen and so be it. The Reformers have reduced five millions after the Tories (Sir R. Peel himself) had declared further reduction impracticable. Between thirty and forty millions have been reduced since 1816. The Reform Ministry, if permitted to remain in power, will pursue the same

career, if not, the people will enforce reduction. The Central Association will not forward the good work an atom.

There is no greater nor no more popular fallacy in political economics than that which lurks under the passage in the petition we now cite.

"That the interests of the retail dealers, and of a large and important class of manufacturers throughout the country, are inseparably connected with those of the agricultural classes, of whom the consumption and expenditure are very materially reduced by a continuance of the present distress."

It is true, perfectly true, that the prosperity of the whole is bound up together. But what is the meaning of this resolution? Give us high prices and we will give you a brisk trade. But how are the means of this brisk trade to be thus furnished? Why first from the manufacturers. Give us a high price for our corn—our commodity—and we will return part of that high price to you for your manufactures—your commodity. This sort of reciprocity acts precisely like the enlarged expenditure of Government in consequence of an enlarged taxation. Government first comes to the country, and says, pay me a million.—The country pays it. Government then comes and says build me a fleet, and I will lay out your million in the purchase. It is clear the individuals composing the nation would have been as rich either with the money originally in their pockets, or with the ships in their possession—but in this case they first part with their money, and then give the produce of so much labour, the fleet, to get it back again. In a word, they give their labour for nothing. So when the landed interest says give us a high price for your bread and we will give you that money back again for your clothes, it is no less clear the manufacturer gives first his money and then his labour to get the extra price back again—or it is at best a money change of equivalents, the price being merely arbitrary and nominal. Not to perceive this (which the Central petitioners appear not to perceive) is to be alike shallow and ignorant of the first principles of barter and exchange. Such is not the way to enrich either class. If the corn grower can add a bushel per acre to his production, that is so much clear gain, so much additional wealth. For admitting abundance to produce low price, as the price of all other commodities fall with the price of subsistence, he will be able to command just as much as the additional value of his additional bushel will purchase. Mere elevation or depression of price in any other sense reduces itself to a mere exchange of equivalents, and becomes therefore only nominal.

The danger to the fundholders from agricultural distress, as it is called, there is strong cause to doubt—and for this reason. The revenue of a country is neither more nor less than a per centage ON ALL ITS PRODUCTIONS. Now we see that although it must be admitted, two bushels of wheat are required to pay the share of taxes paid by the landed interest which one at double the price would pay, there are abatements, and no very slight abatements. *Half the taxation has already been reduced* since wheat was at seventy or eighty shillings a quarter upon an average. An increasing population must almost necessarily create a proportionately greater production. Taxation is not only therefore less (perhaps proportionately less) but there is an indefinitely augmented fund of production to draw from—agricultural in part—else how has supply equalled demand, and brought down price? and of manufactures still more considerably.—The assertion "that the present distress very much affects also the interests of the fundholders, as it will ultimately render precarious,

and perhaps impossible, the payment of the dividends," appears then to be altogether a gratuitous and not very probable assumption on the part of the Central Petitioners.

The next paragraph, which relates to the non-employment of labour, is another truism—lamentable enough, God knows: but what then? If want of employment necessarily follows the abstraction of the tenant's capital from his pocket, REDUCE HIS FIXED EXPENCES, RENT, TITHES, and TAXES. His fluctuating expences, labour, seed, horseproven-der, tradesmen's bills, all the other components of of price fall with the fall of the price of subsistence, they have already fallen—the remedy lies then with the Landlord, the Parson, and the Government. What is the use of puling about the employment of labour being "rendered very precarious by the rapid reduction of agricultural capital." The remedy, Gentlemen and Clergy of the Central Association, lies mainly with yourselves, at least so far as your own postulate is concerned. Had not the farmer been gulled since 1816, by protecting laws, his capital would not have been rapidly reduced, because he would have of his own motion, "reduced his own expences to the level of the present (that is to say, the existing) prices." But the petitioners overleap a very material truth in the hope of strengthening their case, by the assumption that labour has gone out of employment, mainly because the farmer's capital has been drained away from him. That farmers should be blockheads enough to maintain the labourer in the condition of a pauper (for the man and his family must be clothed and fed) at an expense nearly equal to that he would incur by employing him and reaping the benefits of his labour is credible only to a limited and small extent. The fact is, labour, like wheat, has felt the force of the law of demand and supply. Labourers have multiplied, while the area of employment has not been enlarged. Hence a glut in the labour market, hence the greater appearance of the want of employment, far more than from the drain upon the operative capital of agriculture, heavy though it has but too surely been.

We come now to the only single sentence of decently common sense in the whole petition, and which is in truth Earl Stanhope's first resolution, namely:—

"That nothing can remove the present overwhelming distress but the adoption of some measure which will either raise the price of produce to the level of the burthens imposed, or bring down the burthens to the level of the present prices."

"I hope here be truths" as the clown says in Shakespeare. Why to be sure, Gentlemen, you are perfectly right, if a man cannot get the cost for the article he makes, he must reduce the cost—and what is more, *he will*. Now it is as palpable as the light of day, that nothing, save the visitation of death by Providence, can raise the price of corn, the cost of producing it must then be brought down to meet the price. We have shown the elements of price that have and those that have not conformed. *Down must come rent, tithe, and taxes*. If the farmer be bamboozled by any other hope, he will be drawn away from his true interests by a Jack o'lantern, and the little property he has left will sink with him in the bog into which he will be allured. Let not the Landowner or the clergyman conceive we are opposing their interests. We are merely showing the case as it stands. In morals, in physics, in commerce, or in art, we must take the facts as we find them, no matter to what they tend. The facts must direct our reason and our practice—all other is but false philosophising. There is no truth more important to the calculations of the landed interest than this,

The only point in which we agree then with the Petitioners, is in the general lamentation for the calamity which has fallen upon the landed interest, and in a more confident belief than it vent res to express, that Government and the legislature will do all that legislation can do for them. But if (as we imagine) they shall be delivered from some part of the malt tax (a doubtful and at any rate a brief resource,) if certain of the taxes that bear directly upon agriculture, be changed for others less direct, still it will be found the case of the Waggoner and Hercules—he may pray to the greater power, but he must set his shoulder to the wheel and help himself. Associations and a Central Society may be beneficial inasmuch as they open his eyes to scientific improvement and enlarge the knowledge and practice of his art. But if they lead him from home, if they take money out of his pocket and teach him to expect aid which cannot be extended to him, such as we have shewn this nonsensical petition would persuade him to believe, he will only find himself in a worse situation than he stands at present—with less property, more exhaustion, and more exasperation, at which indeed it is one of the many faults of this most faulty composition before us to point with too great force and apparent reliance. Menaces, even in the shape of hints and apprehensions, neither can nor will do anything in this case. FARMERS OF ENGLAND! Take Earl Stanhope's alternative proposition—follow it sternly and steadily. *Bring down the burthens to the level of the present prices, and you will be safe—there is neither safety nor success to be assured in any other course.*

#### THE CORN TRADE.

(From the Liverpool Times.)

A plan has for some time been under discussion in this town, bearing on the Corn Trade and the Agriculture of the United Kingdom, which from its feasibility and importance we shall lay before our readers, and to which we beg to call the attention of the shipowners of this port, as well as of all persons interested in the trade with the West India Colonies, and in the agricultural prosperity of England and Ireland. After a good deal of discussion, the outlines of the plan have been agreed on, and at a meeting of merchants held on Thursday last, they were embodied in the form of resolutions, and made the subject of a memorial to the Board of Trade, which now lies for signature in the Exchange News-room, and has already received the signatures of many of our most intelligent and respectable merchants. The plan, as will be seen from the following statement, divides itself into two parts, the principle object of the first part being to relieve the holders of foreign corn, now in bond in this kingdom; and that of the second to open a new outlet for British and Irish wheat, and thus to remove, as far as possible, the depression under which the agriculture of the kingdom is at present suffering.

Our commercial readers are all aware that the British Colonies in the West Indies, as well as the Island of Newfoundland and some of the South American States, have been for many years supplied with flour from the United States, and that neither England nor any other nation has ever yet attempted to compete with the Americans in this branch of trade, which now takes off about 900,000 barrels of flour every year, of the value of more than a million sterling. The comparative dearness of corn in England and Ireland rendered it impossible for the British corn grower to compete with the American, whilst the nations of the Baltic having few mills and

no great commercial enterprize, have not hitherto sent their corn in a ground state to the West Indies. Hence, with the exception of a moderate quantity of flour sent from the Canadas, the Americans have long enjoyed the sole command of the market. Within the last year, however, a great change has taken place. From the deficiency of the harvest in the United States, the price of wheat, and, of course, of flour, has greatly risen in the American market, whilst from the abundance of English and Irish harvests, it has fallen in as great a proportion in this country. The price of wheat in the States at present, according to the memorial which lies for signature in the Exchange Room, is from 42s to 46s a quarter, whilst the average of all England is only 37s. Thus even English wheat is at present cheaper than American, and as for bonded foreign wheat it may be bought in Liverpool at from 25s to 28s per quarter. Already English flour has begun to be exported to the West Indies, and if the foreign corn now in bond in this country was allowed to be ground into flour, and exported, the holders would, of course, be relieved from what threatens to be a ruinous speculation, the English shipowners would be benefited to the amount of the freight, the English and Irish millers by the grinding, and the West Indians would obtain their flour one-third cheaper than at present. This, therefore, is an object of the greatest consequence to all the parties, and accordingly it is with the holders of foreign wheat that the first part of the plan originated, the object of which is to have a bill passed similar to the Grinding Bill of 1824, authorizing the grinding of the 600,000 quarters of corn now in bond in this country for the purpose of exportation.

There are, however, several eminent houses in this town, interested in the British and Irish Corn Trade, who strongly object to the transference of this new market for grain from the corn growers of the British Empire to foreigners, and who contend that British interests ought first to be looked to. For their satisfaction the second part of the plan has been devised, the object of which is to secure first, the interests of the English and Irish corn growers, and secondly, those of the holders of foreign grain. The manner in which these objects are to be effected is as follows:—

It is proposed, that when the prices of British grain are depressed, as they are at present, every person exporting a barrel of British flour shall receive, as a bonus for so doing, a certificate authorizing him to release, at any future time when he thinks best, as much foreign grain as can be liberated by the amount of duty which was payable on the import of a barrel of flour at the time when his export took place. Let us suppose that the barrel of British flour is exported to-day, and that the duty on a barrel of foreign flour this day is 25s 8d. The exporter having received his certificate or debenture, may immediately bring out of bond a barrel of foreign flour, and sell it in the market free of duty. But in place of this, he has the option of keeping the certificate until the price of British corn has risen, and until the duty on foreign corn has fallen, and then he is authorized to bring out of bond not only one barrel, but as much more as the sum of 25s 8d will set free, which may be a barrel and a half, or even, if the price has risen greatly, two barrels. Thus, as a bonus for exporting one barrel of British flour at the present time, when the prices are greatly depressed in the home market, he receives the privilege of introducing one and a half or two barrels of foreign flour into the home market, when prices have become better. The certificate or debenture may also be

made saleable in the market, like an Exchequer bill, and thus be transferred from hand to hand at pleasure.

The advantage of this plan to the British and Irish corn-grower and miller is, that it gives to the holders of foreign grain a strong motive for exporting British flour, and is thus likely to raise the present very low prices of British produce; whilst the advantage to the holder of foreign grain is, that it gives him the power, when prices have risen, of introducing, duty free, a quantity of foreign corn more than equal to that exported when they were low. It is the opinion of persons well acquainted with, and deeply interested in both the British and foreign corn trades, that the plan would be found very beneficial to all parties interested in the trade, whilst its advantages to the shipowners, who at present find it difficult to obtain freight from this country to the West Indians themselves, are too obvious to require any observa-

Upon the whole, we think, that this scheme affords, what was omitted in the Corn Bill, a very salutary bounty on the export of British and Irish Flour, when the price becomes so grievously depressed as of late; and we see no plan so well calculated to raise prices now, nor one so likely to prevent the recurrence of such low ones for the future.

## THE CORN AND FLOUR TRADE.

(From the *Liverpool Times*.)

The plan for the permanent relief of the British Agriculturist, developed in the last number of our paper, has been laid before some of the members of Government, and also before many noblemen and gentlemen connected with the landed interest, and has generally been received by them with favour. In those cases where it has not it has been rather because the question was not clearly understood than because any objection to the plan could be shown to exist, or because any flaw was discovered in the reasoning on which it rested. The plan certainly requires consideration before it can be appreciated or even fully understood, but the advantages to all the interests involved in the scheme are sufficiently great to render it worth the effort. When once understood the mode of working will be easily seen, and the chances of success and advantage be easily calculated.

As this article may fall into the hands of some who have not seen the plan as described in our last paper, we republish it for their information, before making a few additional observations upon it. It is as follows:—

“It is proposed, that when the prices of British grain are depressed, as they are at present, every person exporting a barrel of British flour shall receive, as a bonus for so doing, a certificate authorizing him to release, at any future time when he thinks best, as much foreign grain as can be liberated by the amount of duty which was payable on the import of a barrel of flour at the time when his export took place. Let us suppose that the barrel of British flour is exported to-day, and that the duty on a barrel of foreign flour this day is 25s. 8d. The exporter having received his certificate or debenture, may immediately bring out of bond a barrel of foreign flour, and sell it in the market free of duty. But in place of this, he has the option of keeping the certificate until the price of British corn has risen, and until the duty on foreign corn has fallen, and then he is authorized to bring out of bond not only one barrel, but as much more as the sum of 25s. 8d. will set free, which may be a barrel and a half, or even, if the price has risen greatly, two barrels. Thus, as a bonus for ex-

porting one barrel of British flour at the present time, when the prices are greatly depressed in the home market, he receives the privilege of introducing one and a half or two barrels of foreign flour into the home market, when prices have become better. The certificate or debenture may also be made saleable in the market, like an Exchequer bill, and thus be transferred from hand to hand at pleasure.”

It will at once be perceived by those who examine this plan that its principal result on the English and Irish agriculturist will be to equalize prices by diminishing the chances of ruinous depression at one time, and those of extravagant elevation at another. As soon as prices fall materially and unduly it will be the interest of the merchant to export British flour to the West Indies, to Newfoundland, or the Slave States of South America, and as soon as they have risen considerably it will be his interest to introduce his foreign grain into the British market, without waiting for the lowest possible rate of duty. The English and Irish farmers will thus have a new market for their produce, when the prices in this country make it most desirable for them to have it, and the English public, instead of seeing the averages worked by all manner of tricks, almost up to starvation prices, before a quarter of foreign grain is liberated, will see it gradually introduced as soon as the prices rise, and that in the manner and the quantities most likely to preserve the corn trade from ruinous fluctuations.

At present the English and Irish corn-growers have no mode of disposing of any part of their produce except in the home market, and this must ever be the case, unless some plan can be devised by which it can be made the same thing to the exporter whether he exports British or foreign flour. The export of British flour to the West Indies at the present time is a mere accident, and must cease the moment that prices fall in the United States, or rise (as they are doing) in this country. Without some such bounty as that recommended in our last paper, the export will not last three months; but, with the aid of such a bonus, it may become a permanent branch of trade. The privilege of introducing a barrel of foreign flour duty free into the British market, in return for every barrel of British flour exported, might itself be sufficient to induce numbers to take their chance of a profit on the export to the West Indies; whilst the privilege of introducing much more than one barrel for every barrel exported, gives the prospect of a double profit to the exporters, and will probably have the effect of rendering the trade both durable and extensive.

We have already shown how the first part of this plan would benefit the British corn-grower when prices are low, and we shall now show how the second would benefit the public when they rise. The interest of the holders of bonded grain in a rising market is to hold out as long as possible, and to raise the averages to the highest possible point. The interest of the holders of corn certificates would, however, be to get their corn into the market before the general holders of bonded corn could afford to compete with them. Hence bonded corn would come earlier into the rising market, and the markets would never rise to the extravagant prices which we have occasionally known. Steady prices are for the interest of all parties, and this scheme, by taking off surpluses, and promptly supplying deficiencies, would effect that object, so far as the irregularities of the season and the present working of the corn laws render it possible.

It must not be supposed, even if we take no part in this trade, that it will remain in its present state.

Last year 28,000 brls of flour were exported from Danzig to the British West Indies; the Hamburgers have gone even more extensively into the trade; and the corn-growers of the channel island of Guernsey have also begun to export flour to the same colonies. Another consequence of the export of flour from the North of Germany is, that the merchants of Hamburg have begun to send salt beef, pork, and other provisions of the same sort, along with their flour, as part of the cargo, and thus threaten to drive the Irish provision merchants out of the colonial market. If English merchants are to be allowed to go into the trade now is the time, whilst flour is dear in the United States, and before the merchants of Germany and the Baltic have occupied the market. When once they have got possession it will be no easy thing to drive them out, or even to compete with them.

Since the first part of this article was written, we have learnt that the Liverpool memorial has been laid before the Board of Trade, and referred by the Board to the Lords of the Treasury for their consideration. When the answer of their lordships is returned we shall lay it before our readers.

#### BONDED CORN.

(From the Times.)

It appears that some correspondence is carrying on with the Board of Trade by the leading merchants and members of the corn trade in Liverpool and in London on the subject of the proposed measure for allowing foreign wheat in bond to be ground into flour for exportation, and that they expect to succeed in carrying at least some modification of such a measure into effect. They have also devised some plans by which, as they conceive, any objections to it on the part of the agricultural interest may be removed. It has been proposed, among other expedients, that the preliminary operations should be carried on with English wheat, for which an immediate demand would thus be created, and a preference perhaps established for the flour produced by it in the West Indian and American markets. In return for this they have proposed that a privilege should be granted to them of taking out of bond, free of duty, as much foreign wheat as would be represented by the amount of duty, treating as foreign, of the English wheat ground into flour for exportation, the parties being permitted to select their own time for doing this. Thus, for example, supposing the rate of duty on foreign wheat, as regulated by the averages, to be 30s the qr, at the time when a given number, say 1,000 of quarters of English wheat are exported in the shape of flour, the merchant or exporter would in that case have his option of either taking out of bond immediately 1,000 quarters of foreign wheat, or of waiting for the chances of fluctuation in the amount of duty. If it fell to 20s, he would then be allowed to take 1,500 qrs of foreign wheat out of bond; or, on the other hand, if the duty rose to 40s, and he then thought proper to close his operation, he would only release by it from bond 750 quarters of foreign wheat. Intermediate fluctuations of duty to be regulated of course upon the same plan. The exporter, on certifying the shipment of the flour, would receive a debenture, which would be transferable, for the release from bond of a corresponding quantity of wheat to the duty payable at the time of the shipment. Others, however, foresee much difficulty in this plan, and content themselves with urg-

ing the experiment of grinding into flour for exportation the quantity of foreign wheat now in bond, under such regulations as might be thought proper. All further operations of the kind they would leave to be determined by the success of that experiment. A deputation has been appointed to carry on the communications with the Board of Trade on the subject.

#### THE AGRICULTURAL COMMITTEE.

(From the Times.)

The agricultural committee agreed to on Monday last by the House of Commons, is in the nature of a sop to a hungry dog, or of a toy to a wayward infant. Facts may be thereby collected no doubt—some well founded, others more apocryphal; but when gentlemen come to the chapter of remedies—that is to say, the only description of remedy which will be considered by those who seek for it worth a single straw—viz., the bolstering up of rents through artificial devices, of which the *modus operandi* is to be the raising the price of agricultural produce by special act of parliament, whilst all other commodities but corn are left to find their own level!—it is tolerably easy to foresee how the agricultural committee must finish, even without the aid of currency doctors from Birmingham to precipitate its doom.

#### AGRICULTURAL DISTRESS.

(From the Suffolk Chronicle.)

Our Suffolk Tories, after all, like their prototype, the magnanimous Tom Thumb, have—

“ ——— First made Giants;  
Then they slew them.”

All their agitation, all their plots and counterplots, all their bombasting ravings that the present Government were the worst foes to the agricultural Interest, have, like the mountain in labour, produced only a *ridiculus mus!* A committee of enquiry into the causes of Agricultural depression was all they sought for—and sure they were that no Liberal Ministry would grant them so preposterous a demand. But lo! and behold! without even the awful denunciations of the Central Agricultural Society, which was to make them tremble in their seats—without even a single petition being presented—the Government most willingly appeased their ire, and fettered their tongues, by nominating a Committee of Inquiry on the third day after the opening of the Session. This unexpected, and we believe, unwished-for compliance, has literally left the Central, and all the Branch Societies throughout the country nothing to do. No repeal of the taxes which press most heavily on agriculture can be demanded, until the committee have made their report. However urgent may be the necessities of the tenants for relief—the same amount of rents, the same amount of taxes, and the same amount of tithes must be paid—and the cry will be, wait! wait till the cause of your distress can be ascertained.

## TURF INTELLIGENCE.

In our last number we had occasion to notice the suspicious transactions that have lately taken place in the Sister Island, which have appeared in several publications under the title of "Delicate Investigation," not a very appropriate appellation certainly. The moment Mr. Ruthven received the slightest intimation that doubts were entertained of the genuineness of Caroline and Leinster, he ought to have solicited that inquiry from which he shrunk in a manner that could not fail to excite suspicion, even if no ulterior proceedings had been adopted; but to the honour of the Turf Club of Ireland, the matter was not suffered to sleep itself into oblivion: a candid, fair, and impartial investigation has taken place, which exhibits the business in so clear a light, that no further doubt can be entertained upon it. Some of the papers reported the death of Mr. Ruthven, and when the account appeared before our orbs of vision, we concluded the "Delicate Investigation" had *broken his heart!* The report was untrue; for we find that this gentleman, whose name is tagged with M. P., has since appeared amongst an assemblage of his constituents, and, on being accused of shrinking from inquiry, complained of ill-treatment, and begged his political friends would suspend their judgment till he had established his spotless integrity, and received ample justice from a jury of his country! Bah! What jury could be so eligible as the honourable and independent Turf Club of Ireland, before whom Mr. Ruthven refused to plead? It is painfully suspicious to hear professed turfites prating about appeals to a jury of their country on turf affairs. Mr. Ruthven shirked the question when it was brought before the most competent tribunal possible; but we will wait, nevertheless, to observe the manner in which this gentleman may attempt to redeem his pledge, before we proceed to make those observations upon the case, and the parties concerned, which it imperiously demands, and which it shall not fail to receive at our hands: we are public centinels, and will not fail in our duty.

*Steeple Racing* has become very prevalent, and indeed very general, and we regard it as an interesting addition to the already established ramifications of the turf. Cocktail racing originated, no doubt, in the best possible feeling; but, inasmuch as it opened a field for gross and disgusting fraud, it soon became evident that more than ordinary suspicion must attend all its movements. After the affairs of Tom Paine, of Mercury, of Tawpy, Miracle, Sawney, Agnes, Gossoon, Fitzjames, &c., &c., and the more recent business of Swing, Napoleon-le-Grand, &c., &c., who could avoid regarding cocktail racing

with unqualified disgust? If it be not desirable to prevent it altogether, let it be put on a very different footing: for instance, let welter weights be placed alike on all the candidates for this species of secondary fame, and the race or stakes open to any and all competitors.

To *Hurdle Racing*, the same illimitable scope for swindling does not present itself before the eyes of the base-minded and the studious rogue; the best horse, if judiciously ridden, will not fail to win, if all be on the square, and there can be but little temptation for fraudulent dealing. Therefore, if a hurdle race or two be deemed requisite as a sort of finish to the meeting or the season, in the name of all that's liberal, let not the gallant spirits who are emulous to exhibit their feats of equestrianism on the velvet turf of the course, be denied this inoffensive, if not praise-worthy, amusement.

We are glad to see steeple racing encouraged; we are glad to see it cherished and patronized by men of the first rank and station in society; and we rejoice to see the conditions of the stakes not narrowed up by local prejudice, but made as comprehensive as possible, and the whole system rendered so far unexceptionable.

But, to show the imperturbable ignorance of those spuriously-illegitimate disciples of the press, who profess to convey intelligence to the public on turf affairs and field sports: these cunning literary mountebanks, have denominated the amusement under consideration, "*Steeple Chases!*" Can any thing be more ridiculous? To the Normans we are indebted for our language of the chase, the original of which is still to be found, if not "in very choice Italian," in the vernacular idiom of the period, and distinguished at the present day by the appellation of Norman-French; and if recourse be had to the musty mouldering records of ages passed away, it will be found that the word chase, implies the pursuit of some animal; whereas, in the diversion of which we are speaking, a number of horses are matched against each other to cross a certain extent of country, and he who reaches the goal first is deemed the winner; consequently, it is a race across hedge and ditch, instead of a race upon the course. Prior to this period, we were indebted to the mock "London Sporting Reporter," the Newmarket literary charlatan, for a number of absurdities and gross misapplications; and we sincerely believe that his title to the authorship of steeple *chasing* is omnipotently indisputable.

In regard to the word *steeple*, it may be observed, that although it has become a misnomer, its application was originally as correct as possible. When steeple races were

first introduced, the steeple of some distant church, (which might be distinctly seen) formed the goal; thus it was agreed to start from a given spot, and reach the steeple agreed upon. However, our cross-country racers have abandoned the benefit of clergy, and have substituted flags for those venerable *muralittis* with which the country is everywhere embellished.

It seldom happens that a professed jockey is a superior workman over a country, and, therefore, this class of diminutive mortals are not exactly calculated for that kind of equestrianism which is necessarily called into operation in steeple racing; yet, we are of opinion, we could select a few from amongst the numerous body of these truly *elite*, who would venture at such an undertaking, if well paid for the trouble: Tom Nicholson, if he be not equal to Chiffney, to Rushing Robinson, Sam Darling, or Day, is, at least, a fearless horseman; and we would not hesitate to back him against any of those we have enumerated, for a start, or, indeed, for the use of the spur. Those who cannot follow hounds are not calculated for steeple racing; we never saw Nicholson in the hunting field, but we have repeatedly observed jockies attend the fixtures, watch the draw, see the fox found, and return home. We have seen a few ride well to hounds, particularly Simeon Templeman. But steeple racing was not intended for the employment of the Newmarket dandy jocks, such as Pavis and Co., or the accomplished horsemen of Yorkshire, such as Darling, and his fraternity; on the contrary, it was meant for the emulous spirits of the chace, whose noble daring is equally conspicuous after hounds, or in the arduous struggle of the steeple race.

The knowing ones in the good old city of Chester are adepts at handicapping; but, fearful lest the Queen of Trumps might spoil their sport at the ensuing meeting, they allotted her a weight (8 st. 12lb.) which her owner was not likely to accept, and accordingly Mr. Mostyn has declined to risk the *unscrewing* of his splendid filly—over an excellent course certainly, but which moist weather or rain renders very heavy, particularly that part of it which is formed on the margin of the river Dee.

Red Rover, up to the early part of last month, the favourite for the Chester cup, receded considerably on the betting list, in consequence of a report of his having become "*dead amiss*;" however, when we consider the quarter whence this suspicious report was bruited, (the Manchester Sporting Reporter, who, like his Brother of the Metropolis, is no conjuror in turf affairs, though skilful enough, for ought we know to the contrary, in the art of *legerdemain*,) we are scarcely inclined to alter our opinion on the subject. Jupiter was therefore placed at the top of the list, for what reason we at a loss to discover; his performances could not have entitled him to such an enviable distinction;

while we are not aware of a superior horse that ever belonged to the same family—the weight placed upon him (8st 2lb) may, perhaps, be considered favourable. Red Rover has, however, reascended, as will be seen in the list.

In our next publication we shall be enabled to make a few definite observations respecting the Liverpool Trade Cup, as the acceptances will be declared ere these remarks meet the eyes of our readers, (March 1) when, of course, business will assume a tangible shape. It is true, betting lists have been hawked about, upon which, of course, little dependence could be placed, when the acceptances were unknown.

In the Liverpool Craven Meeting one pound less has been allotted to the Queen of Trumps, (8st. 11lb.) than the weight which was offered to her by the Chester Cup; yet, we are disposed to think she will not accept on this occasion, but that Mr. Mostyn will reserve her energies for the July Meeting at the same place, because the prize (the Trade Cup) will be much more valuable, and the Cambrian Queen will be considerably advanced in the fifth year of her age. On this occasion, she will have to meet the crack horse of the day, Touchstone, should he accept the weight, 9st. 7lb., enough in all conscience for the straight run in of half a mile. General Chasse appears in the list, (as he does also in that for the Craven Meeting, with the same weight,) with 9st. 4lb. placed against him. Can Touchstone give General Chasse 3lb over Liverpool course? We think not. The General acquired unfading laurels upon this course; he has run over it many times; knows it well, and has always appeared to advantage upon it. Queen of Trumps, Touchstone, and General Chasse, are no ordinary trio: "When Greek meets Greek, then comes the tug of war." Yet, it must not be forgotten, that in a handicap, the object is to bring the nags as nearly together as possible, to reduce a superior animal to the level of a jib or a jade; and, therefore, in handicap racing, an inferior horse is likely enough to bear away the prize. By way of illustration, it may be remarked that Red Rover appears in the list now under consideration very favourably weighted, 8st. 10lb, and is five years old. Mundig, as a matter of course, appears in the brilliant array, with 8st. 7lb. placed opposite his name, which is 7lb. less than the weight awarded to Queen of Trumps, according to the acknowledged estimation of such matters, that is, allowing 3lb for the latter, as being of the feminine gender,—and Mundig a winner of the Derby! a striking acknowledgment of the truth of our prediction, that the powers of this horse were reduced almost to nothingness by his distressing achievement on Epsom Downs. It remains to be seen (and it will soon be ascertained) whether Mundig will continue on the turf.

A DURHAM OX,  
THE PROPERTY OF EARL SPENCER,  
Exhibited at the Smithfield Show, 1835.

London: Published by J. Richardson - April 1836.

# THE FARMER'S MAGAZINE.

APRIL, 1836.

No. 4.]

[VOL. IV.

## THE PLATE.

The DURHAM OX, the subject of the Plate, was the property of EARL SPENCER, and was exhibited at the Smithfield Show in December last,—was four years and ten months old,—fed on hay, mangel-wurzel, Swedish turnips, and oil-cake; and obtained a premium of Twenty Sovereigns as “the best Ox of any breed.” A Silver Medal was also awarded to his Lordship as the Breeder.

## ORIGINAL LETTERS.

No. XVIII.

TO THE EDITOR OF “THE FARMER'S  
MAGAZINE.”

“The operations of policy far surpass the labours of Hercules, preventing many evils which valour and might cannot even redress. Unhappy are the people who are governed by valour not directed by prudence, and not mitigated by the gentle arts.”—FENELON.

SIR,—The formation of agricultural associations throughout the country appears to me to be a circumstance that must be viewed with pleasure by every person connected with rural pursuits, and although it may be said with some truth that every association lately formed appears to have a separate object of its own to forward, and, consequently, that there is little unanimity of pursuit or purpose, even among persons most connected with the landed interest; still the very communication and intercourse, necessarily attendant on such a state of things, cannot fail, I think, of producing some desirable effect.

The Central Association now established in London must be considered entirely political. This is, I apprehend, the sole purpose of that society, and I confess I am one of those who think that some good may result in consequence of the attention which must be bestowed by the Government to all representations proceeding from so influential a source; and, accordingly, I entirely dissent to your observations on the subject, which I found in your Magazine for January as preliminary remarks to your Review of the Corn Trade for that month. But it is not my present purpose to enter at any length on this subject, as I wish now to speak of that department of these societies which has for its object the rewarding of meritorious labourers,—but I must say, that so far from condemning any step as yet taken by the Central Association, that I coincide completely with the principles its sup-

porters have laid down for the regulation of their future proceedings. I will now speak of the associations having a local tendency only. I feel, it is true, a strong inclination to dwell on the subject of the Central Association, or, in other words, to have a batch of politics; but this inclination I must resist for the far more grateful task of endeavouring to interest your readers on the subject of Premiums to Labourers, and on some other matters connected with the bettering the condition of the working classes. It may not be unacceptable to some of your readers, who happen to be engaged in forming societies of this nature, to give at length the rules and regulations of two associations which have just been formed in this part of the world for the express purpose of rewarding skilful and well-conducted labourers. One of these associations is at Chichester, of which the Duke of Richmond is the President, and the other at Arundel, of which the Earl of Surrey is President. When I say the above two noblemen are the Presidents of these Societies, I wish to be understood, that they do not hold this office *nominally* and *ostentatiously*, but *practically* and *usefully*, by attending the meetings of their committees, and taking generally an active part in the proceedings, thus forwarding by the influence of their *presence* and *example* an object always *desirable* in its nature, but especially *desirable* at the present moment, when the operation of the Poor Law Amendment Bill has certainly a temporary tendency to restrict the means of the labouring classes. Thus, then—for a time at least—is another difficulty added to the circumstances of the poor—and thus is a new necessity created for an additional stimulus to moral conduct and habits. Now, it appears to me, that this object will be most effectually obtained by publicly acknowledging and substantially rewarding the industrious—the honest—the sober—and the skilful. The natural bias of the human mind tends most decidedly to the possessing of the good opi-

nion of one's fellow mortals. This is the distinction at which we all aim. This is the distinction which every superior mind ought to hold out to its inferior, and this, in truth, is a principle of action which has been completely neglected—I may say has been annihilated—by the late system of Poor Laws in England.

It has been said that these societies will work no good end, because it is impossible to instil a laudable ambition into a degraded mind. This may be quite true. But I apprehend no one will assert that a degraded mind cannot be reclaimed, or that the acknowledgment and distinction of virtue will not at all times discourage vice. Surely the thirst for distinction to be obtained by laudable pursuits and virtuous conduct has a much more decided effect on every civilized society than any fear which arises from the punishment of crime can produce. Burns, the Scotch poet, in his "Advice to a Young Friend," truly says

"The fear o' Hell's a baneman's whip—  
To hold the wretch in order."

and again he says

"Ill not say men are villains all—  
The real hardened wicked,  
Who have no check but *human law*,  
Are to a few restricted."

and I will be bold to say, with the exception of those last alluded to by the poet (the *no-check* but *human-law-men*;) that the moral conduct of the lower orders will be improved by the reward system, when the principle becomes generally adopted. A few days ago, in a conversation I was holding with a labouring man as to the present difficulties of persons in his situation in life, I made use of an expression—as advice to him—which appeared afterwards to me to be of very questionable nature, on account of the great probability of its being misapplied. I said to the man you must learn to abridge your wants as much as possible. That we certainly must was the reply. Now, if this man understood me to mean that he ought to restrict any desire which he might entertain to support himself and his family on *substantial and wholesome food*, or to shelter himself and them in a *warm and comfortable habitation*, and to be clothed in *decent and sufficient apparel*, and these necessities to be obtained by his *honest and unremitting labour*, he certainly attributed to my words a meaning that I was far from intending to convey. The notion of bringing the poor to a *coarser food* I repudiate with disgust. Such a sentiment is the immediate offspring of cruelty and folly. To degrade the body is truly to debase the mind, and there is no degradation that I am aware of which can exceed that which has a tendency to induce human beings to be satisfied with a diet at which a brute would turn in disgust,—or to be contented with raiment less capable of bestowing comfort than the natural clothing of quadrupeds afford to them,—or to quietly accept a shed as a domicile neither impervious to the wet nor a shelter from the wind. If any doubt the demoralizing effect of such a state of things, I will instance the poor of Ireland as a case in point. Let me recommend a perusal of the Report of the Poor Law Commissioners for that unfortunate country, and then let me ask if the return to a *coarser food* be any longer thought to be desirable? Oh, no! it is not the laudable desire of the hard-working, the frugal, and the sober to partake of *substantial fare*, to be covered with *decent raiment*, and to be housed by a *clean and comfortable dwelling*, which is in any degree

the cause of our present distress; indeed, the fact is exactly the reverse; but this distress may with some justice be attributed to the luxurious indulgence of the thoughtless and the depraved, to the pompous vanities of the upstart drones of society, and to the unprincipled extravagancies of a vulgar profligates.

The glory of these mighty kingdoms must be supported by the multitude, and not by any small band or knot of persons. The multitude consists of the labouring part of the community, and thus it is the *real strength* of the nation which it has been proposed to reduce to a *coarser food*. As if *men coarsely provided for ever were, or ever will be good citizens!* No, before you can make the labouring part of the community—who, with God's blessing on industry, produce the substantial necessities of this life—be satisfied to exist on *refuse and garbage*, you must at least occasion in their minds the same happy compromise that the Fox in the Fable made with his own inclinations, viz., that the grapes are sour. And to accomplish this end there will be found some little difficulty. Labour gives a rest to the senses, and, consequently, it will be a hard task to flatter the olfactories of a working man with a grub in the gutter to the prejudice of the fumes from the porridge-pot, or the savoury effluvia from the oven.—*Coarser food*, indeed! Odious expression! *Let us, like Sterne's Recording Angel, drop a tear of pity upon the word, and blot it out for ever.*

The following is a list of the premiums, and the regulations and conditions of the West Sussex Association for the encouragement of industrious and meritorious agricultural labourers residing in the Western Division of the County of Sussex, or within twenty miles of the City of Chichester:—

CLASS A.—For labourers who have brought up the largest families respectively, with the smallest amount of parochial relief.—First, *5l*; second, *4l*; third, *3l*; fourth, *2l*; fifth, *1l*.

CLASS B.—For single men who have lived the longest in one place with the best characters.—First, *5l*; second, *4l*; third, *3l*; fourth, *2l*; fifth, *1l*.

CLASS C.—For widows who have brought up the largest families respectively, with the smallest amount of parochial relief.—First, *5l*; second, *3l*; third, *2l*.

CLASS D.—For female servants who have lived the longest in one place, with good characters.—First, *4l*; second, *3l*; third, *2l*; fourth, *1l*.

CLASS E.—For labourers who have placed out at respectable service their daughters at an early age, and who have remained in that service, with good characters.—First, *4l*; second, *3l*; third, *2l*; fourth, *1l*.

CLASS F.—For shepherds of flock-masters who have the care of not less than ten score of ewes, who have reared the greatest number of lambs with the least loss, regard being had to the circumstances both as to the farm and flock.—First, *5l*; second, *3l*; third, *2l*; fourth, *1l*.

CLASS G.—For the best ploughmen.—First, *4l*; second, *3l*; third, *2l*.

CLASS H.—For the best sheep-shearers.—First, *3l*; second, *2l*; third, *1l*.

CLASS I.—For single men under twenty years of age, who have lived the longest in one place, with good characters.—First, *3l*; second, *2l*; third, *1l*.

CLASS J.—For female servants under 20 years of age, who have lived the longest in one place, with good characters.—First, *3l*; second, *2l*; third, *1l*.

CLASS K.—For boys under sixteen years of age who plough the best.—First, 1*l* 10*s*; second, 1*l*.

GENERAL CONDITIONS AND REGULATIONS.

The certificates to be referred to a sub-committee of seven, who are to decide upon the merits of the respective candidates—three to be a quorum.

The Committee to appoint the Judges of the Sheep-Shearing, which will take place in June, and of the Ploughing Matches which will be held on the 7th of September.

The Committee to be empowered to defray the expenses of every candidate they may think deserving, provided always that the total amount shall not exceed 10*l*.

The Sub-Committee to be empowered to call for additional certificates if they think fit.

That every candidate shall transmit to the Secretary—at least a fortnight previous to the day of decision—a certificate of general good character, sobriety, and regularity of attendance at Divine Worship, signed by the employer of such labourer, the Guardian, Churchwarden, or Overseer of the parish wherein he is resident,—and the Officiating Clergyman,—or by four respectable householders of the said parish.

That with respect to Classes A. and C. a further certificate be produced at the same time of the length of service under one employer, the number of his or her children, and the amount of parochial relief that has been received by such labourer or widow.

That with respect to Classes B. and D. a certificate must be produced of the length of service under one employer, as well as of general good character, signed by the employer.

That with respect to Class E. a certificate must be produced of the names of all the daughters, the ages at which they were respectively placed out at service, and their characters, signed by the employers of such girls, and by the churchwardens and overseers.

That a General Meeting of the Society be held on the 7th of September at Chichester, on which day the prizes will be awarded, and a certificate signed by the Chairman will be given to each successful candidate.

I will now take the rules and premiums of the Arundel and Bramber Association, because, as these rules and premiums differ very essentially from those of Chichester, it will enable such of your subscribers who happen to be engaged in getting up societies of this description, to select from both those premiums and regulations which may appear to them to be most desirable.

CLASS A.—AGRICULTURAL SERVANTS.—To the single man who has lived the longest time in the same service either in or out of the house, 3*l*; second, 2*l*.

To the single woman who has lived the longest time in one service 3*l*; second, 2*l*.

To the lad under eighteen years of age who has lived the longest time in one service—as *hired servant* living in doors.—First, 2*l*; second, 1*l*.

To the girl under twenty years of age who has lived the longest time in one service, and whose character is without stain.—First, 2*l*; second, 1*l*.

CLASS B.—The same premiums to tradesmen's servants under like circumstances.

CLASS C.—SHEPHERDS, CARTERS, & LABOURERS.—To the shepherd on the Hills above twenty-two years of age who has lived five years in the same occupation, with the same master, and who can

produce the most satisfactory certificates of industry and skill.—First, 5*l*; second, 3*l*; third, 2*l*.

To the shepherd on the Lowlands above twenty-two years of age, who has lived five years in the same occupation with the same master, and who can produce the most satisfactory certificates of industry and skill.—First, 5*l*; second, 3*l*; third, 2*l*.

To the shepherd on the Hills under twenty-two years of age, who has lived five years with the same master, and who can produce the most satisfactory certificates of industry and skill.—First, 2*l*; second, 1*l*; third, 10*s*.

To the shepherd on the Lowlands under twenty-two years of age, who has lived five years with the same master, and who can produce the most satisfactory certificates of industry and skill.—First, 2*l*; second, 1*l*; third, 10*s*.

\* \* \* No person will be considered a shepherd entitled to compete for the premiums who has not the care of ten score ewes.

To the carter who has lived the longest time, and is still living with the same master or mistress, and who can produce the most satisfactory testimonials of habitual sobriety.—First, 3*l*; second, 2*l*; third, 1*l*.

To the labourer who has worked the longest time for the same master or mistress, or on the same farm.—First, 3*l*; second, 2*l*; third, 1*l*.

CLASS D.—GARDEN CULTIVATORS.—To the five cottagers whose cottages and gardens consisting of not more than a quarter of an acre shall be kept and cultivated in the neatest manner, and the general appearance of whose crop, making due allowance for the natural quality of the soil, shall be most satisfactory to the judges appointed to view them 1*l* each.

CLASS E.—PLOWING TO TAKE PLACE 7TH OCTOBER, 1836.—To the man who ploughs 5½ acres of clover-ley in the best manner, with two horses, without a driver, and who has lived three years or upwards in his place.—First, 3*l*; second, 2*l*; third, 1*l*. For the second premium the man must have lived two years in his place, and for the third one year.

To the ploughboy or lad who ploughs ½ an acre best, under twenty years of age.—First, 2*l*; second, 1*l*; third, 10*s*.

CLASS F.—HEDGING.—To the man who makes one rod and a half of the best hedge and ditch against all sorts of cattle.—First, 2*l*; second, 1*l*.

CLASS G.—SHEEP-SHEARING.—To the man who shall shear ten hogget sheep in the best manner and in the shortest time.—First, 3*l*; second, 2*l*; third, 1*l*.

To each unsuccessful adult competitor will be given 3*s*; and to each lad or boy 1*s* 6*d* for his loss of time.

Each candidate must bring with him a certificate (as under) of good conduct, to be signed by the Minister of the parish where he resides, and by at least one of the parish officers.

We the undersigned do hereby certify that A.B. labourer of this parish is, to the best of our knowledge and belief—first, a regular attendant at Divine Worship; secondly, not one of those who waste their money and time while they corrupt their morals in public-houses or beer-shops; and, lastly, that his (or her) conduct is good, and such as to render him (or her) a fit subject for an honourable reward and distinction.

Minister of the Parish,

Overseer, Churchwarden, or Guardian.

Claims for prizes, together with certificates of

any facts required to be proved, must be delivered at the Committee-room in Arundel, between the hours of ten and eleven o'clock in the forenoon of the first of August, or to some member of the Committee not less than two days previously.

The right is, however, reserved to the Committee, if it shall think fit, of enlarging the time for receiving claims and certificates.

Printed forms for claims and certificates may be had of the several members of the Committee at any time after the first of March.

Seven days notice will be given to the successful competitors for prizes previously to the annual meeting.

Competitors for prizes who may feel themselves aggrieved by the decision of the umpires may appeal to the committee at the annual meeting previously to the distribution.

The determination of the Committee in all cases to be final.

It has often been said that comparisons are odious, and I fully admit the truth of this observation; but, on the present occasion, I must risk the odium of comparing a few of the leading principles of the above associations, with the hope that these remarks may be of some use to such of your readers as may be embarked in a like undertaking. It will be observed, that by the rules of the Arundel Society, it is imperative for every candidate to produce a *certificate from the minister of the parish*, (a copy of which certificate is given above) before he can be admitted as a competitor for any prize.

The Chichester Society requires a like certificate from the clergyman, or from four respectable householders.

The Chichester Society does not require a certain length of service with one master in the case of shepherds and ploughmen, &c., &c.

The Arundel Society makes length of service a qualification in all cases where it is practicable to do so.

The Chichester Society bestows its rewards in instances of large families brought up with the least parochial relief.

The Arundel Society does not consider it wise to offer a premium on increase of population, and accordingly bestows its prizes without any reference to large or small families.

These are the main features of difference in these too laudable institutions, and I mention them for the consideration of others engaged in a like pursuit, without any observation of my own on the comparative merit of either.—I am, Sir, your obedient and very humble servant,

Sussex, March 4, 1836. AGRICULTOR.

No. XIX.

## A PLAN FOR THE EXTINCTION OF TITHES.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—In order that tithes may cease for ever, and that it may be effected without being detrimental to the interests of any, it is proposed (if it be admitted that a claim to tithes can be made out), that a valuation of all titheable property shall be taken, and that three shillings, two shillings and sixpence, or two shillings in the pound on the rental, as the legislature shall think proper, as an equivalent for tithes, shall be specified; that a calculation of the value thereof, according to the interests of the present incumbents, shall be made, and that the Government shall buy up

these tithes, and pay the full amount thereof over to their proper owners: and that in order to defray the expense incurred, a tax shall be levied on all titheable property, similar to a land-tax, and to be redeemable in like manner; and at the demise of the present incumbents, the glebe shall go with the proceeds of the parish into the general fund.

As regards lay impropricators, there appears, on the first view of the case, to be a difficulty; but it must be allowed by all, that these tithes have been misappropriated, seeing they are not applied to the support of ministers of the gospel, nor to the promotion of religion in any shape or form: therefore the first transfer of them to secular purposes, was a direct prostitution of them from their original design, and consequently an alienation of the revenues of the church: this being the case, all those who have been dealing in tithes from the commencement of this traffic, have been manifestly in palpable error and culpable for their neglect in not examining the nature of the property they were about to purchase, especially those who have happened to purchase them within the last twenty-five years, when the voice of discontent and alarm has been sounding from one end of the nation to the other. I therefore contend that the first possessors of them have been paid tenfold for their outlay, and those who have purchased them more recently, have done it with their eyes open, and consequently have none to blame but themselves: as it is, I would leave it to the wisdom of the legislature to determine, and give them their just due.

It must be evident to every discerning person, from what transpired at the Exeter meeting for a commutation of tithes, and also from the disposition which a large majority of the people have manifested at different other places where meetings have been held for that purpose, that the day for a commutation for tithes is gone by: I would not say with the learned Lord Ebrington, that "concession now, after so long a delay, would lose half its weight and half its value," for I am strongly of opinion that any concession, short of abolition, would lose all its weight and all its value.

The bishops may talk about equalling the revenues of the church, and of giving to each of her ministers a proper maintenance—they may propose to do away with pluralities, and non-residences, &c., but are these the essentials of the prayer of the people? Will these reforms in church discipline (however laudable and how much soever it might have tended to her honour and to the advancement of religion, if it had been carried into effect some twenty years ago) redress the wrongs and ease the burdens of the people? No, nothing will satisfy the people now, in this enlightened age, but a total extinction of tithes.

It will be in vain to tamper with the disease, seeing it is become so direful in its aspect; unless a proper application is had recourse to, and an efficient remedy prescribed, it will soon show itself in a more malignant form, when all future prescriptions will prove abortive.

As enough has been experienced, and said, and written, on the evils of the present system, I need not enter into detail of the facts of the case, but shall conclude by earnestly hoping that such measures (by the wisdom of the legislature, under the guidance and direction of the Great Head of the Church) may be adopted, as shall secure the general weal, the promotion of religion, the safety, honour, and welfare, of our Sovereign and his dominions.

A FARMER AND SUBSCRIBER.

Feb. 25, 1836.

No. XX.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

Glasgow, March 13.

Sir,—In reply to the numerous enquiries from the South, concerning the stock of grain and prospects of the trade in this quarter, I beg to hand you a few remarks, which you may perhaps find room for in your extensively read pages.

Since the first of January, with an occasional few days' dulness, we have had a progressive advance of about 6s to 7s per quarter on wheat, a very slight improvement on barley, while oats have been very steady.

During the whole period of the advance, our bakers have been steadily increasing their stock, and notwithstanding the enormous consumption which is going on, I have no hesitation in saying, that the quantity of wheat held by them, is greater than at any former period.

The stock of wheat in the hands of merchants and speculators is also very great. On the 31st December, 1835, the stock in granary was 66,000 qrs, and since that time at least 15,000 qrs must have been added to it, principally fine English red wheats, making a stock of upwards of 80,000 qrs! a quantity quite beyond precedent.

Our stock of spring corn is by no means heavy; on the 31st December we had only 20,000 qrs of oats in store, and since that time about 20,000 qrs may have been added, making together but a moderate stock for our extended consumption.

Of barley it may be said we have no stock, so trifling is the quantity in store.

During the last three years there has been a considerable quantity of Irish flour brought to this market, which has hitherto been sold from the ship; at present, however, a stop having almost been put to its use by the extravagantly high prices asked for it, an accumulation to a considerable extent has taken place.

Last year's crop has turned out better, in this quarter, than was expected, and there is still a greater portion than is usual at this day of the year, in the barn-yards.

We have a dreadfully unwieldy stock altogether, and unless we have a very backward spring, our present prices will be maintained with great difficulty. Hitherto the weather has been cold and boisterous, but there has been no sharp frosts, and though the young wheat is backward, our farmers are not at all alarmed, as it is still healthy at the root, and the weather yesterday and to-day is assuming a more settled appearance.

I am, Sir, most respectfully, W. R.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

Aleuton Hall, March 10, 1836.

Sir,—As the imposition of an additional duty on foreign tallow, and the repeal of the soap duty, are about to be brought before the House of Commons, I think that the loss the grazier sustains when the price of fat is below that of meat, which it formerly equalled, cannot be too generally known; the following calculations, which I will thank you to insert in the Farmer's Magazine, are formed upon data acknowledged to be correct by practical men, shew the effect the variation in price of that article has upon

different descriptions of land. The value of hides has also considerably decreased from the numbers which are annually imported. The increase in price both of meat and tallow, at the present moment, can only be attributed to the shortness of the supply, which the total failure of turnips in those counties which usually fill the London markets at this season, has occasioned. Surely the time has arrived, when the profits of the English farmer are annihilated—when the land is overwhelmed with the most oppressive parochial assessments, of which the fundholder, the merchant and manufacturer, do not bear their fair fair proportion; as appears from the Parliamentary Returns, which state that out of £8,606,501 9s, lands and dwelling-houses contributed so large a part as £8,070,147 18s; that the landlord and the tenant have a right to expect not only a more equitable distribution of these burdens, but also that those fiscal regulations which admit the produce of foreign nations—such as timber, bark, tallow, hides, rape, &c. &c.—at such low duties, as to deprive the home grower of all profit, should be revised.

I am your obedient servant,

H. W. WILSON.

Good Grazing Land, worth about 40s per acre, will feed 2 Beasts, of about 64 st, 14 lb to the stone, on 3 acres; the fat in each may be calculated at one-eighth or 8 st, which at 3d per lb less than that of meat, which it has often averaged, amounts to 28s each.

Two on 3 acres, or 16 st, fat at 3d per lb,	s. d.
56s; one-third No. of acres .....	18 8
One and a half Sheep, per acre—taking the tallow cake, the fat on the kidney, and parings of neck, chine and loins, at 20 lbs each, at 3d,—5s; or per acre .....	7 6

Loss, per acre .....	26 2
----------------------	------

Or, allowing that the Grazier ought to make three rents—one for himself, one for expenses, and one for the landlord—from 20 to 25 per cent. on the rent on land of less value, say about 32s per acre.

1 Beast of 50 st. to 2 acres—the fat 6 st, at 3d per lb—21s; the half .....	s. d.
10 6	
1 Sheep, per acre, as above .....	5 0

Loss, per acre .....	15 6
----------------------	------

Price, 2½d lower.

2 Beasts, as in the first instance, 16 st fat, at 2½d—46s 8d; one-third .....	s. d.
15 6	
1½ Sheep .....	6 3

Loss, per acre .....	21 9½
----------------------	-------

On average store and feeding land—meat at 5d, fat 3d.

Half a Beast of 8 score and 10 lb per qr, 7 st fat, 14 lb to the st, at 2d less .....	s. d.
8 2	
Half a Sheep, taking lowest possible average of 12 st fat .....	1 0

9 2
-----

Or, one-third less, 13s 3d per acre direct loss, besides that which the grazier loses indirectly by selling his stock when not thoroughly fat, which he sometimes is induced to do under present prices, large and very fat animals not being so valuable per lb as smaller ones.

Beast and Sheep fed on artificial food will average more fat than is here calculated.

No. XXII.

ASSOCIATION OF THE TENANT  
AGRICULTURISTS.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

Sir,—I was born and bred a farmer. My hands have all my life been more accustomed to handle the plough than the pen, and therefore I trust you will correct any mistakes I may commit in writing. Fortunately for me I farmed in times when produce was in great demand, and consequently fetched high prices. I realized a small independence, and retired from business. In my retirement I have amused myself by perusing the various agricultural publications which have appeared, and in watching the changes which have taken place in the agricultural world. I have seen with regret the declining state of the farming class, and I have contemplated with as much eagerness as those who were actually in business, any prospect of amendment. I have read with infinite satisfaction the proceedings of the Highland Society of Scotland; I have seen the benefits which have accrued from many local establishments in England, and, consequently, when I first saw the announcement of the intended establishment of a Central Agricultural Society in London I anticipated the most beneficial results from it. I have narrowly watched the proceedings of this Society; I have carefully perused all the documents put forth by it, and I regret most sincerely to be compelled to state that never was a favourable opportunity of establishing a society which might have contributed largely to the improvement of agriculture, and, consequently, to the bettering the condition of the practical farmer, been so lamentably thrown away. The early declarations of the society convinced me that the acting parties were perfectly unacquainted with the means which were necessary to be adopted for improving the condition of the working farmer. But the last declaration put forth under the authority of the Society has perfectly astounded me. Looking to the importance which this society attached to the *landed interest*, and the vast exertion, which was considered necessary to rescue it from the grasp of the *monied interest*, I conceived that attention to the agricultural interest alone would have been sufficient occupation for the society. I now, however, perceive that the society undertakes the advocacy not only of the agricultural interest but also of the manufacturing, commercial, and maritime or shipping interests. Now, Sir, I consider these other classes as much entitled to protection as the agricultural class; but when I look at the extent of the agricultural class,—when I contemplate their difficulties, and when I reflect upon the incalculable advantages which, as it seems to me, might result from a society which was properly organized for practical purposes,—I do feel persuaded that the individuals who can so soon lose sight of the main object for which the society was established, are neither capable of, nor calculated to benefit the farmer. I am one of those who think that the new Poor Law Act is calculated to do much good both to the farmer and the labourer. I live in a district where its practical benefit has already been experienced. It is, therefore, with much regret I perceive the society endeavouring to promote a new cause of dissatisfaction amongst the labourers, by setting forth the injustice of their not being *represented* as a distinct class. I am perfectly astonished that the gentlemen, whose names have been announced as members of the Central Society, should suffer opinions to be promulgated under their authority, not only calculated to excite dissatisfaction but also to

promote those principles of representation which moderate men of all parties deprecate.

If the agricultural labourers are to be represented as a class, it follows as a matter of justice that the operatives of every class must also have their representatives. What then does this proposition amount to less than *universal suffrage*? So then, the Central Agricultural Society, certain members of which have taken so much pains to prove that it is not a political society, is actually advocating universal suffrage, and that under the authority of Earl Stanhope, Lord Darlington, Earl Winchilsea, Lord Wynford, and other noblemen of the like conservative principles. I am fully persuaded that the society will not serve the tenant, who is the person really suffering. I should, therefore, propose the formation of a society of *tenant farmers* and farmers occupying their own lands, for the benefit and protection of the *tenantry*, leaving the landlords, who are already sufficiently powerful, to take care of their own interests. Such a society might be established at a very trifling expense. Its objects should be strictly practical. If, Mr. Editor, any of your numerous readers may feel disposed to promote such a society, in which *tenants* might discuss freely and without restraint their situation, and their own interests, I am perfectly at leisure, and will most readily take upon myself the arrangement of the details, until the society shall have been established; and I think the result will be productive of more practical benefit to the working farmer than the theoretical notions of the landlords, bankers, and others, constituting the Central Agricultural Society.

I am, Sir, your obedient servant,

Feb. 25.

AN OLD FARMER.

P.S. I give you my name and address, and perhaps you will permit any letters upon the subject to be addressed to me at my office, and forward them to me by post. [We shall be happy to receive any communications, and will forward them without delay.—Edit.]

## SALE OF NORTH DEVON CATTLE.

On Wednesday, March 16, the sale by auction, by Mr. J. Mogridge, of the Farming Stock of Mr. Francis Quartly, of Molland, took place; and, as a breed of pure North Devon Cattle it had acquired such celebrity that it was attended not only by a great number of the Gentlemen Amateur Breeders of Devon and the adjoining districts, but it also attracted several from Norfolk and many other counties. Mr. Quartly's breed of cattle have for many years been considered as pre-eminent; of the correctness of which there can no longer remain the least doubt, from the great and unparalleled prices for which they have now been sold.—The 21-months-old Bull, which obtained the Sillifant prize at Exeter in November last, was sold for 97 guineas; another Bull, 18 months old, fetched 83 guineas; one Cow obtained 53 guineas; ten Cows were sold for 371 guineas and a half; one two-year-old Heifer went for 50 guineas and half; another for 30 guineas, and another for 28 guineas; one yearling Heifer sold for 23 guineas, one for 18½, one for 18, and one for 17½; and one Heifer Calf for 21½ guineas. Curly (the admired Cow) sold for 53 guineas; she was the dam of the highest-priced Bull: the Heifer Calf also sold for 21½ guineas.—The above stock of cattle consisted of 73 head, 15 of which were calves; and, together, they produced the sum of £1621 13s 6d—prices unprecedented in this county.—The whole of the stock, including Horses and Pigs, were sold in less than four hours; which, together, obtained the sum of £1819 15s 6d. Several lots were purchased for His Grace the Duke of Norfolk; as were others for Mr. Coke, of Holkham; many lots were also bought by different gentlemen in Cornwall and Somerset; and many of the very prime blood were purchased and retained on the farm by Mr. John Quartly, who succeeds his uncle.

### THE SHEEP.—SPECIES AND VARIETIES.

The origin of the domestic sheep has been sought for by naturalists in various wild races:—

1. *Ovis musmon*—The Musmon.
2. *Ovis ammon*—The Argali.
3. *Ovis tragelaphus*—The Bearded Sheep of Africa.

The musmon of the Mediterranean islands, is yet found wild in Corsica and Sardinia, in the mountains of European Turkey, in Crete and other islands of the Archipelago. It does not differ greatly in its characters, but it differs widely in its habits, from the domestic races of Europe.

The Argali or wild sheep of Asia, inhabits the mountains of central Asia, and the elevated plains of Siberia northwards to Kamschatka. It has horns of great length; its colour is gray, and it is covered with wool beneath a close hair.

The bearded sheep of Africa is found in Barbary and the mountainous parts of Egypt. A variety introduced into East Friesland, and crossed by the common breed, is said to have produced the large prolific sheep of the Texel.

To these wild races might be added *Ovis montana*, the Rocky-mountain sheep of America, an animal of great size, and inhabiting the mountainous parts of North America. But it is believed that the Rocky-mountain sheep of America is the same as the argali of Asia.

These are the wild animals of the race of sheep that have been yet discovered. Which of them, if any, has given rise to the domestic races, has been matter of dispute. In different countries different kinds of sheep are domesticated, and may have been derived from the wild races in the countries where they are found, and in some cases produced by intermixtures which cannot be traced.

The domestic sheep of Europe is usually termed *Ovis aries*. The female goes with young twenty-one weeks, and generally brings forth her young in spring. She produces one, and often two, but rarely more than two, at a birth. She yields milk in quantity sufficient to nourish her young. Her milk produces little cream; but the quantity of caseous matter which it yields is comparatively large. This, when made into cheese, is wholesome, but strong-tasted.

The sheep appears to attain his most perfect state as to size and form in the temperate zone. He is there covered with wool, whereas in warmer countries he is more covered with hair, as he also partially is in the colder countries, where his size is likewise diminutive. The wool of the sheep falls off and is renewed every year; and the period of its falling off is early in summer.

In its natural state the sheep has horns; but in the domesticated races the horns frequently disappear, and the most valued breeds are entirely destitute of them. The sheep is a very hardy creature with regard to the effects of temperature, its thick coat of wool defending it well from cold and moisture. It has been known to live for a long time under snow. It is a harmless and timid creature, and in its domesticated state is dependent upon man for protection and food. In mountainous countries, however, where it is less domesticated, and must trust greatly to its own resources, it manifests its instinctive powers of self-protection. It scratches up the snow with its feet in search of food; it is conscious of an impending storm, and takes the means to secure itself from its violence; it is wary and vigilant, and numbers have been known to com-

bine for defence against beasts of prey. But though, under these circumstances vigilant, and in cases of necessity bold, all the habits of this creature lead it to submit to the dominion of man, and from the earliest times accordingly it has been the subservient instrument of our race.

Whether the wild race of sheep be all of one species, as some naturalists suppose, or of different species, as others maintain, the domestic races with which we are familiar in this island are believed to be of one species; and what we term breeds are merely varieties produced by different conditions of situation, food, and culture.

These conditions, however, produce a great diversity in the size, characters, and economical uses of the animal. Judging from general aspect only, we might believe that the diminutive creature of the Zetland islands, of the size of a little dog, is a distinct species from the large sheep of the Romney marsh; yet the species are believed to be the same. The sheep, like the other animals necessary for human support, is fitted to adapt himself to the physical circumstances with which he is surrounded. In a country of heaths and scanty herbage, he is small, agile, and hardy. In a country of plains and rich herbage, he becomes of great size, unfitted for active motion, and less capable of providing for his own wants.

In the British islands, attention has long been paid to the culture of the sheep. In many parts it remains almost in its natural state; but in others it has been brought to all the perfection with respect to form, early maturity, and disposition to feed, which appears to consist with the nature of the animal.

Besides the properties of size and form, sheep are distinguished from each other by the nature of their wool. Sometimes it is short and fine, and fitted for the making of cloths; and sometimes it is long, and suited to the making of worsteds and coarser fabrics.

The main divisions of what are termed breeds in this country are into the sheep of the mountains, lower moors, and downs,—and the sheep of the richer plains. The varieties of the former class have sometimes horns, and are sometimes destitute of horns; they have sometimes short wool and sometimes long wool: the true sheep of the plains are all destitute of horns, and have long wool. The following may be enumerated as the principal breeds of this country:—

1. The Zetland sheep.
2. The Dun-wooled sheep.
3. The Black-faced leath sheep.
4. The Moorland sheep of Devonshire.
5. The Cheviot sheep.
6. The Horned varieties of Fine-wooled sheep of Norfolk, Wiltshire, and Dorset.
7. The Ryeland sheep.
8. The Southdown sheep.
9. The Merino sheep.
10. The Devonshire Notts, the Romney-marsh sheep, the Old Lincolnshire, Tees-water, and Old Leicester.
11. The New-Leicester and improved Tees-water sheep.

The Zetland sheep exist in the islands whence they take their name, but, with some change of characters, extend to the Faroe islands and the remoter Hebrides. They are the least of all our races of sheep. They are generally without horns. The wool is adapted to the making of the finest fabrics, and forms a fine fur. Mixed with the wool, however, is a coat of coarse hair, which, when the wool falls off, forms a covering to the animal. The like character is possessed by some other sheep in the

extreme north of Europe; and it is probable that it is from this source that the fine-woolled sheep of the remoter Highlands has been derived. These little creatures are very hardy, and may be suited to the scanty pastures where they are reared, but they are not deserving of more extended cultivation.

The Dun-woolled variety of sheep seems to have been once very generally extended. There is more or less of a dun colour of the wool, sometimes on the face or legs, and sometimes in patches on the body. Remnants of this original race are yet found in Scotland, in Wales, and in the Isle of Man. A similar breed extends to Normandy and other parts of Europe. The wool is soft and fine, and the mutton good; but in other respects the breed does not deserve cultivation.

The black-faced heath sheep are the natural inhabitants of a country of mountains and heaths. Their wool, though shaggy and coarse, is light, weighing from 3 to 4lb the fleece. They are of the smaller class, but they are the hardiest, boldest, and most active of all our sheep; they have horns, and their legs and faces are black; they feed readily when brought to good pastures, and their mutton is in great esteem.

This race of mountain sheep is found on the highlands of Yorkshire, on the mountains of Cumberland and Westmorland, on the mountains in the south of Scotland, in Argyllshire, and all northward through the western and central highlands. The best examples of the breed are usually found in Tweeddale and the adjacent districts.

For an elevated and rugged country, where the chief pasturage is heath, this breed is exceedingly well suited. The objection to it is the little value of the fleece, which is the coarsest of the wools produced in this country. This circumstance has, in many districts, caused a substitution of the Cheviot for the black-faced breed. But although the Cheviot breed is superior to the black-faced in weight and value of the wool, it is not possessed of the same hardy qualities; and the black-faced may, therefore, be cultivated with advantage in situations to which the Cheviot is unsuited.

The black-faced breed, though well defined, loses many of its characters when naturalized in a low, marshy, or less heathy district. Its wool becomes less coarse; the darkness of its colour diminishes; its legs and face become spotted or grey; and its horns sometimes disappear. Hence this breed is in some places so changed in its external characters, as to have lost much of its resemblance to the parent stock.

The moorland sheep of Devonshire, termed the Exmoor and Dartmoor, derive their names from the districts of Devonshire where they are found. They have horns, white legs and faces, and long wool; they are hardy, and supposed to be suited to the wet undrained country which they inhabit: their wool weighs about 4lbs the fleece: they are of the smaller class of sheep, and their form is bad.

The next mountain breed to be mentioned possesses very distinct characters. This is the Cheviot, so termed from being reared on the mountains round Cheviot, whence it has been very widely extended to other elevated districts.

The Cheviot sheep are heavier than the black-faced; they are without horns; the wool is fine, and the weight of the fleece is about 3lbs and upwards. The sheep, like those of other mountain breeds, are light in the fore-quarters. They are hardy, active, and well suited to an elevated country.

The mountains where this race of sheep is indi-

genous, though high, are mostly covered with a green sward, and thus differ from the heathy mountains of other parts. The nature of this range of pasturage may have contributed to give its peculiar characters to this breed, though it is probable that some cross, of which the history is now lost, may have added to the effect. The Cheviot sheep have been greatly improved, but the breeders having directed attention more to the form and size of the animals, than to the quality of the wool, the latter has diminished in fineness, though it has increased in quantity.

The properties to be desired in a mountain breed are, that it shall be hardy, of good form, of sufficient size, and with good wool; and for a combination of these qualities, the mountain breed of the Cheviots has not been equalled in this island.

The horned varieties of fine-woolled sheep, though reared in a comparatively low country, are allied to the sheep of the mountains, lower moors, and downs.

Of this class of breeds the Norfolk prevails in the counties of Norfolk and Suffolk. The sheep of this breed have large spiral horns and short wool. They differ from the black-faced heath sheep and the moorland sheep of Devonshire, in having short wool, and from the Cheviot in having horns. They are tolerably suited to the dry pastures where they are chiefly found, but they are of a bad form, having thin bodies and flat ribs; they are of about the same weight as the Cheviots, and the wool is about 2lbs the fleece; they are of a restless disposition, and are considered to be slow feeders; they are generally giving place to the Southdown, which are in all respects a superior breed.

The Wiltshire sheep are distinguished by large spiral horns, but the legs and faces are white, and they are heavier than the Norfolk. Their wool is fine, weighing about 2½lbs the fleece; and they are the largest of our fine-woolled sheep. The county of Wilts, where they are naturalized, consists in a great part of downs, and this breed was regarded as hardy, and well suited to the nature of the pastures; but it has been gradually giving place to the Southdown.

The sheep of the Dorset breed have small horns, with white legs and faces. Their wool is heavier and less fine than that of the Wiltshire sheep, weighing from 3lbs to 4lbs the fleece and more. They are a hardy race of sheep, being chiefly bred on the open downs of this part of England. They are remarkable for the ewes admitting the rams at an earlier period than any other sheep, and on this account they are valued for producing lambs for winter consumption.

The Ryeland breed is so named from a district in Herefordshire. The sheep are very small, white-faced, and without horns. The wool is very fine, weighing about 2lbs the fleece; the ewes, when fat, weigh from 12lbs to 14lbs, and the wethers from 12lbs to 16lbs the quarter; their flesh is delicate, and they may be said to be suited to the stunted pastures on which they are reared.

This breed has been crossed with the Spanish Merino, and the produce brought into extensive notice under the name of Merino-Ryeland or Anglo-Merino. Great exertions were made to extend this cross; but, though it produced good wool, it has altogether declined in favour. There are other breeds allied to the Ryeland, which, like it, have fine wool, and are bred on soils yielding light herbage.

The Southdown is a breed of fine-woolled sheep, now greatly esteemed, and extensively diffused on the light soils and chalky downs of England. They

are without horns: their legs and faces are grey, and like the sheep of the mountains, they are light in their fore-quarters. Their wool is fine and short, being from 2 to 3 inches in length, and weighing, on an average, about 2½lbs the fleece. Their flesh is of excellent flavour; they are a hardy class of sheep, kindly feeders, and well suited to the species of pasture on which they are chiefly reared; they are about the size of the Cheviot sheep, the wethers, when fat, weighing about 18lbs the quarter.

These sheep have been reared from time immemorial upon the chalky soils of Sussex; they have spread into other districts of light soils and downs, and also into some to which they are not well adapted.

Much care has been bestowed on the cultivation of this breed, and it has accordingly been much improved; but attention having been mainly directed to the form and fattening properties of the animals, the quality of the wool has declined, though its quantity has increased.

In the class of fine-wooled sheep is the Merino or Spanish breed, now partially naturalized. They are originally natives of the northern provinces of Spain, and were introduced into this country in the year 1783. In the year 1792, the rams were made to cross the Ryeland, the Southdown, and other fine-wooled breeds of England. His Majesty king George III. had introduced rams of the Merino breed from Spain, and cultivated it with care. In the year 1804, the sales which then began of his Majesty's stock, attracted great attention to the breed; and, in the year 1811, a society was formed for the purpose of encouraging and extending it.

The result of the crosses with the native sheep has not in any degree fulfilled the expectations formed. The wool of the native sheep has indeed been improved in quality; but this has been accompanied by defects in the characters of the animals themselves not to be compensated by the increased value of the fleece. The sheep of the mixed breed have nearly all proved defective in their forms, slow feeders, and less hardy than the parent stock.

Flocks, however, of the pure Merinos have been preserved, and the progeny of these has remained superior to the new or cross-breeds. The naturalized Merinos retain their natural characters, though the wool becomes longer and heavier than in Spain, and the body more large. But the entire form of the Merino as a feeding animal is bad, the animal small, and the return in mutton deficient both in quantity and value. It is vain that some breeders still contend for the superiority of the pure Merinos; the general judgment of farmers is against them, and with perfect reason.

Could the breeders of this country look more to the fleece than the weight and value of the animal, as in Spain and the parts of Germany where the Merinos have been naturalized, the culture of the breed might become profitable. But the breeder in England finds it his interest to direct attention mainly to the weight and value of the flesh; and while this is so, it will be more advantageous that this country import the wool of other countries than that the feeders either adopt an inferior animal, like the Merino, or sacrifice the more essential properties of the native sheep.

The races of sheep that have been mentioned may be said to be proper to mountains, lower moors, and chalky downs. The sheep of the lower plains are of a larger size, and more productive of flesh and wool, and they are all, it has been said, destitute of horns.

The first of these breeds to be mentioned is the

Devonshire Notts, of which there are two varieties. The first, the dun-faced nott, so named from the brown colour of its face, is a coarse animal, with crooked back and flat sides; it bears a fleece of 10lbs of wool, and is supposed to average, when fat, at 30 months old, about 2½lbs or more the quarter. The other variety is the Bampton nott, which has a white face and legs, but in other respects resembles that last mentioned, producing, however, less wool and being a better feeder. Both of these clumsy breeds have been improved by crosses with the New Leicester.

The Romney-marsh breed has existed from time immemorial in the tract of rich grazing land on the southern coast of the counties of Kent and Sussex. The sheep of this breed are very large, have white faces, and yield a heavy fleece of long wool of good quality of its kind. These sheep are favourites with the London butchers; but their breast is narrow, their extremities coarse, and in other respects their form is defective. They have been crossed by the New Leicester, which has had the effect of diminishing their size and lessening the quantity of their wool, but of improving their general form, and giving them a better disposition to fatten. Some breeders of experience, however, question the good effect of this cross, maintaining that, besides the decrease of weight and deterioration of the fleece, the cross is less suited to the cold and open pastures of the marsh.

The old Lincolnshire sheep, where they yet exist without intermixture, are a large coarse class of sheep, with hollow backs, flat ribs, and a hanging belly. They are slow feeders and their mutton is not esteemed. But they yield a very heavy fleece of long wool.

The Teeswater breed was formerly the stock of the part of England near the river Tees. It is now, however, so entirely changed by crossing with the Dishley breed, that the old unimproved race of the Tees is scarcely now to be found. They were a very large race of sheep, arriving at the greatest weight of any other breed, and, like all the large kinds, being very prolific of lambs. The wool they produced was long and heavy to the fleece.

The old Leicester is a variety of the coarse long-wooled breeds which still exist in several of the midland counties. The sheep of this variety feed to a great weight on rich pastures, but they are coarse slow-feeding animals, and have generally either given place to improved kinds, or had their own characters changed by crossing.

The improved Dishley breed is very generally termed the New Leicester, from having been formed by Mr. Bakewell of Dishley, in the county of Leicestershire. This gentleman was the son of a considerable farmer; and, about the year 1755, had begun to turn his attention to those improvements in the form of feeding animals, by which he became so distinguished. The precise steps which he followed in the forming of his breed of sheep are not known, as he chose to observe a species of mystery upon the subject. He is supposed to have derived his first sheep from Lincolnshire; but however this may be, it was by a steady breeding from the best-formed animals, until the properties aimed at had been acquired, that he gradually corrected the defects, and improved the form of the animals. He was well aware of the external characters which indicate a disposition to feed, and, by a steady course of selection continued during a lifetime, he obtained animals of superior feeding properties to any that had been before cultivated. By constantly breeding, too, from individuals of his own flock, and consequently

near of blood to each other, he gave a permanence to the characters of his breed which it retains to the present hour. Mr. Bakewell adopted the practice of letting out his rams for the season, and this contributed to the general diffusion of his breed. Successors to Mr. Bakewell have continued the same system, and bestowed the utmost care in maintaining the purity of their flocks; and thus from the county of Leicester as a centre, this breed has been spread to every part of England, where the breeders have thought fit to receive it; and it has entirely changed the character of the greater part of the long-woolled breeds of this kingdom.

The sheep of the new Leicester breed are inferior in size to the other varieties which they have supplanted. The wool is but of moderate quality, and in weight it falls short of that of the larger breeds; it weighs from 7lbs to 8lbs, and has a length of pile of from 5 to 7 inches. The value of the breed, therefore, does not consist in the size of the individuals, or the quality or abundance of their wool, but in early maturity, and aptitude to feed. In this latter property, the New Leicester has not been surpassed or equaled by any other breed of cultivated sheep.

The improved Teeswater is derived from the old breed of the Tees. The sheep are smaller than those of the older race, but still they are a weighty class of sheep. They are the largest of all the improved breeds, yield a good fleece, and, like the breed from which they are derived, are very productive of lambs. The Teeswater breed owes its improvement chiefly to crossing with the new Leicester; but the same long-continued care has not been bestowed upon it as upon the other, and, therefore, although feeding to a greater weight, the animals are not so complete in their form, nor so well adapted for general cultivation as the improved Leicester.

The breeds of sheep, then, of this country, may be divided into two classes,—the sheep of the mountains, lower moors, and downs,—and the sheep of the plains.

The sheep of the first class have sometimes horns and sometimes want horns. The finest of them have no horns, namely, the Cheviot and the Southdown. One of them, the black-faced heath breed, has coarse wool; one of them, the moorland sheep of Devonshire, has long but not coarse wool; and all the others have short and fine wool.

Of the moorland and down breeds, as they may be called, the hardest is the black-faced heath breed, and this property points it out as the most suitable for a high and rugged country, where artificial food cannot be procured.

The breed next to this in hardy properties, but surpassing it in the weight of the individuals, is the Cheviot. Where the pasture contains a sufficiency of grasses, this breed deserves the preference over any other known to us for a mountainous country.

The next breed deserving of cultivation is the Southdown. This breed is suited to the chalky and sandy downs of the south of England. It is in this respect a very valuable breed, but it is unsuited to the more rough and elevated pastures, to which the black-faced and Cheviot are adapted.

These are the moorland and down breeds, which appear to be the most deserving of cultivation in this country. Of the larger breeds of the plains, the New Leicester is the best adapted to general cultivation; and wherever an improved system of tillage is established, this admirable breed may be introduced.—*Lou's Agriculture.*

## ON PREPARING SOILS FOR GREEN OR FALLOW CROPS.

BY MR. PATRICK SHIRREFF, MUNGOSWELLS, BY HADDINGTON.

(From the Third Report of Drummond's Agricultural Museum.)

Amongst the changes that have taken place in British Agriculture, the frequent introduction of wide drilled grain or fallow crops may be regarded as one of the most important. They not only have directly augmented, to an immense extent, the means of human subsistence, but also indirectly, by furnishing, through the medium of live stock, animal productions of various kinds. They have rendered a repetition of naked fallow less frequent on all soils, and entirely superseded it on some descriptions. Their efficacy, however, as fallow crops, depend much on the execution of the operations attending the culture of them; and this department of rural economy is particularly calculated to call forth the skill and promptitude of the agriculturist.

The green or fallow crops alluded to consist of a variety of plants, differing from each other in many respects; but the preparation of soil for their reception being pretty uniform, the subject shall be considered under the following heads:—

I. PULVERIZATION of soil aids the retention of contained moisture, and absorption of that which nature from time to time supplies, and is so essential to the prosperity of fallow crops in dry weather, that it may be ranked as one of the leading principles of their culture, if not of agriculture generally. An imperfectly pulverised or cloddy soil exposes additional surface to the action of sun and wind, which facilitates the escape of moisture by evaporation, and deprives spring sown crops of free access to air, dew, and gentle rains, as their roots do not generally enter surface clods, and are consequently circumscribed in their range. In short, a cloddy surface directly aggravates the evils of drought, and diminishes the benefits of moisture, and is so unfriendly to the growth of the crops treated of in almost every stage of their existence, that copious and frequent rains can alone counteract the want of pulverization.

Soil is consolidated by moisture, pressure, and drought, and pulverized by the expansive properties of water and agricultural operations. Copious rains seldom fail to consolidate soil not of silicious or peaty nature, and if immediately followed by pressure from animals, and implements, or drought, their pulverization, however perfect it may have been, is destroyed. It is difficult to explain this progress of consolidation, which is perhaps somewhat analogous to what takes place in the preparation of building mortar.\* The effects resulting from a combination of the mentioned circumstances have been known to agriculturists from the remotest ages, and familiar illustrations of them are afforded by mud walls, and perhaps swallow nests. Agricultural writers have reprobated the performance of field operations, when the soil is in a wet state, and almost every husbandman can testify from experience that the effects are pernicious.

Water has been found to attain its maximum of contraction at a temperature of 39 or 40 degrees,

\* Hence the origin of the term sour, which in Scotland is often applied to soils in such a state, although acidity does not exist.

and to expand when it rises or falls from this point. By the expansive properties of water, the particles of earth when saturated with moisture, are separated by the agency of frost in winter, and sunshine in summer. Clay soils afford striking examples of the expansive powers of water; the effects of which are manifest after frost, and similar effects can be traced after powerful sunshine. Mud walls and swallow nests also illustrate the expansion of water, both being durable when kept dry, and soon tumble to pieces when exposed to rain. The injurious effects to pulverization, arising from pressure of soil, when in a wet state, is perhaps in some degree connected with the properties of water. Particles of soil, when saturated with moisture, are distended and emollient, and if acted on by pressure, water will be expelled; the particles lose their porosity, and become consolidated. When soil in this state is acted on by drought, it becomes hard, resembling the nature of brick, and its complete pulverization can alone be restored by the expansive properties of water. Clay soils sustain much greater injury than silicious ones from pressure when wet: owing, perhaps, to the particles of the former being more attenuated and emollient than those of the latter. On such principles, the following system of operations seem to rest—

The plough, harrow, and roller, are the implements employed to obtain pulverization, and act by friction or rubbing. Soil, intended for a green or fallow crop, is usually ploughed in autumn, with the view of decomposing living vegetable matter, and exposing a larger surface to the effects of frost. As soon as the soil is sufficiently dry in spring to admit of beneficial operations, it is re-ploughed lengthways, or across, as circumstances point out, and immediately harrowed, and rolled by a light meadow roller, drawn by one horse. If the soil partakes of considerable tenacity, it is immediately harrowed and rolled a second time. In some cases, where soil was adhesive from drought, a heavy roller, drawn by two horses, has been used with much effect, immediately after the plough, when harrowing followed by a light roller succeeded. By such operations, light soils are brought to a fine tilth; and when a second spring ploughing is given, followed by harrowing and rolling, those of firm texture become pulverulent. In very dry weather it is necessary, however, to execute the various operations with such rapidity that the extent gone over by the plough, at each half-day's journey, should be completed before leaving the field, and on such occasions the roller may be kept in motion if necessary, *from morning till night by a change of horses*. Should the newly exposed surface be damp, and little evaporation going on, the rolling process must be delayed, and harrowing preceded with it. If rain falls gently, and the soil beneath continues dry, the plough may be kept in motion, and harrowing delayed. If the soil is wet, or the clouds portentous of much rain, ploughing should be suspended, as, under such circumstances, it seldom fails to be destructive of pulverization. In short, the system advocated is to avoid pressing the soil when wet, and to expose as little surface as possible to the evaporising effects of sun and wind, by harrowing and rolling as soon after the plough as operations can be performed. Soils so treated are always found pulverulent, and generally to retain sufficient moisture to germinate seeds without the aid of rain.

It may perhaps be objected to this mode of pulverization, that if rain falls after the application of

the roller, the soil is again cemented, and that the process is intricate and tedious. After an experience of nearly twenty years, I have not found soil particularly injured under such circumstances, provided it is permitted to dry before operations recommence. It is, however, difficult to describe in language the precise state of dryness at which the different operations should be executed, and perhaps a thorough knowledge of them can only be acquired by practice. In clear sunshine, or windy weather, the harrowing and rolling should follow in rapid succession after the plough, and rolling may be performed whenever the soil does not adhere to the implement. There is no other system by which pulverization can be so certainly attained; and farmers may simply test its efficacy by pressing with their feet masses of soil saturated with water, moderately damp, and parched by drought; or by rubbing with their fingers bread newly baked, three days old, and thoroughly dried by exposure to heat. In both cases, the first will be consolidated, the second crumble into dust, and the third into small lumps.

The common mode to pulverize land is to plough it over, and wait for rain to assist the harrowing of it. This mode often answers well, and depends on rain falling for success, and without rain the crop is lost.

2. EXTRACTION OF ROOT WEEDS is effected by the same means as pulverization, and both may be attained simultaneously. Root weeds are, however, chiefly extracted by carding the soil, consequently the harrow is more liberally used, and the roller less so, than when seeking pulverization, and a class of implements are much employed, called grubbers, which are also useful in pulverizing.

After the spring ploughing is completed, the harrows usually pass four times over the field—twice lengthways, and twice across—when the roller is employed, and again the harrows twice in one direction. The root weeds are now carefully picked by the hand, and removed from the field in carts. Ploughing, harrowing, rolling, and picking, are repeated till the roots disappear. Thus the object is attained piecemeal. The plough penetrates to the depth of six or seven inches, the harrows to three or four: hence the necessity of repeating the process. Freeing soil of root weeds by means of the plough, harrow, and roller, often requires considerable time to complete the process. The plough is well calculated for bringing to the surface root weeds that are deep in the soil. But it is defective by cutting those which come in contact with the coulter, and by burying such as happen to be on the surface, and it is perhaps owing to these defects that root weeds are so difficult to extirpate.

The grabber class of implements penetrates soil to a greater depth than the common harrow, and is easier drawn in proportion to the execution effected. It brings deep lying root weeds to the surface, like the plough, without re-burying any of them. In short, grubbers, as extractors of root weeds, unite in some degree the valuable properties of plough and harrow, without their defects, and greatly assist them in expedition and efficacy.

The most useful grabber is Finlayson's self-cleaning harrow, which has been extensively used here since 1825, when I first introduced it into Scotland. The next in utility with which I am acquainted is Kirkwood's grabber, and it was my fortune to give this implement the first practical trial it ever had, when on the eve of sending it to

a friend in Kent, with a view of cultivating his hop grounds. Both implements, I believe, are figured and described in the Quarterly Journal of Agriculture, vol. 3, and also in the second edition of London's Encyclopedia of Agriculture.

At the time of trying Kirkwood's grubber it had some defects which, I understand, have not been remedied; and, although possessing superiority over the self-cleaning harrow in facility of removing the implement from the ground, and regulating the depth of the tines, it appears to me little better than an ingenious evasion of Mr. Finlayson's patent, at the expiry of which a superior implement might be constructed combining the merits of the two. But in the meantime I give a decided preference, founded on experience, to the self-cleaning harrow.

The preceding paragraph was written in January, 1832, and I have lately seen such an implement as it predicts. The implement is the self-cleaning harrow, in shape, size, and strength with the apparatus which facilitates the regulation and lifting of Kirkwood's grubber. It is superior to either of the implements.

The self-cleaning harrow or grubber is employed, after ploughing, in spring, passing twice over the field—once length-ways, and once across. The soil is then rolled, harrowed, and hand-picked. A second ploughing in spring is usually given, followed by the self-cleaning harrow passing once over or twice, according to the prevalence of root weeds, which another rolling, harrowing, or picking never fail to extract.

When extraction of root weeds is pursued in connection with pulverization, I have been in the practice of applying the self-cleaning harrow from time to time, as the land was ploughed in spring, followed immediately by a single turn of the common harrow and wooden roller. In this state the field remains until it has all been gone over, when the self-cleaning harrow is passed across its former course, followed by the roller, and a double time of the common harrow, and then hand-picked. By these means the objects sought for will often be obtained. But in extreme cases the whole operations must be repeated. In others, re-ploughing, with a single turn of the self-cleaning harrow, followed by the common harrow, will suffice.

The use of the self-cleaning harrow and roller must be regulated by circumstances, which the farmer can alone judge of; and with a liberal use of the harrow it is a difficult matter to retain moisture in the soil.

In many parts of the world root weeds are not collected by the hand, and the sun is entrusted with their destruction. But the humid atmosphere and weak sun of Scotland is seldom equal to such a task, and in a majority of instances hand-picking is the best mode of removing root weeds.

3. FORMATION OF DRILLS is effected either by the common plough, or that with two mould boards. The latter forms a drill at one stroke, the former by going and returning in the same track. Of late years, the common plough has been used in forming drills at one stroke, and in this respect has superseded the double mould boarded one.

The formation of drills by one stroke of the common plough, generally requires the preparation of from eight to twelve drills before the operations of manuring, &c. commences. A drill is then formed at one stroke, by the plough passing up contiguous to the last formed preparatory drill, with the mould board inclining towards the undrilled portion of the field. When the plough

reaches the extremity of the field, it turns to the left hand, and passes down the first made preparatory drill, forming a new one with manure or seed in the centre. In this manner, the plough forms a drill for receiving manure or seed in its centre in passing up, and one with manure or seed in its centre in passing down, until the field is completed. The depositing of manure or seed in the drills, is encircled by the plough, which may either form drills with the mould board inclining to or from the undrilled portion of the field, but the first way is the best by aiding the covering of manure.

There must be a limit to the width of drill, which the common plough can form at one stroke. Something will depend on the plough, its guide, and the soil; but I have found no difficulty in forming drills thirty-one inches asunder. It requires a good ploughman to form drills with one stroke of the common plough, and although they do not in the first instance appear so finished as when formed with a double stroke, the most critical eye cannot make a distinction after the roller or harrow hath passed over them.

The formation of drills by one stroke of the plough, as hath been described, was practised here many years, and, when compared with the old method, it has much to recommend it. There is, however, a glaring defect in the process which I have succeeded in remedying.

By attending to the description given of forming drills for the reception of manure or seed, it will be observed that the loosened earth is deposited on the right hand side of the ploughman; and on forming the drill with manure or seed in the centre, the same loosened earth is again deposited on the right hand side; thus the earth forming one side of the drill is twice loosened and manured, while that forming the other side remains stationary. This defect is obvious in every case, and more especially when soil is not well pulverised.

The remedy is found in working the field into divisions, by furrows or *feinings*, and keeping ploughs employed in forming with one stroke, drills for the reception of manure or seed, and others following in the same direction, forming drills with manure or seed in the centre. By this method all the earth is once removed, and both sides of the drill equally loosened. The operations do not, as in the other case, proceed in a circle, but still with equal facility and dispatch, and with better effect on the soil, both as regards pulverization and extraction of root weeds; as the whole, instead of half the drill, is operated upon.

4. FORMATION OF RIDGES, distinguished from that of drills, consists in disposing soil into broad parallel sections. The formation of ridges, by the ordinary process of ploughing, is universally understood. But the formation of them, conjoined with that of drill-making, is perhaps a new feature in agricultural operations, to the invention of which I lay claim.

The formation of ridges cannot be altered when forming drills by the double mould-boarded plough, nor by the common plough at a double stroke, or by moving the earth of one side of the drill twice; and the process of drill-making at one stroke, in which one plough follows in the direction of another, is the only one by which the form of ridges can be effected. When ridges require to be raised or gathered up in the drilling process, a drill is formed by a double turn of the plough in the centre of each ridge. The plough then forms drills for the reception of manure or seed, by

passing up one side of a ridge, and down the adjoining side of the next ridge, till both are completed, leaving the furrow dividing the ridges untouched. Drills, with manure or seed in the centre, are formed by the plough giving a double stroke to the first formed drill, in the centre of each ridge, and afterwards passing up one side of the ridge and down the adjoining side of the next, till reaching the furrow, which is divided and cleared by a double turn of the plough. In this manner ridges are raised as effectually as by the ordinary process of ploughing. In short, by this system of drill making, ridges may be altered in every form, precisely as by the common mode of ploughing. There is, however, one peculiarity meriting notice.

The mode of raising or gathering up ridges just noticed, supposes the ridges to contain an odd number of drills—one in the centre, and an equal number on each side. When ridges, containing an even number of drills, require to be raised, the regulating or first stricken drill, is not in the centre, but on one side of ridge, which must have an even number of drills on one side of the regulating drill, and an odd number on the other. Suppose, by way of illustration, the ridge requiring to be raised to contain eight drills, four must be on one side of the regulating drill, and three on the other. In this case, regulating drills must be formed on two adjoining ridges, so as to leave space for three drills on each side of the intermediate furrow, and on the third ridge so as to leave space for four drills on each side of the intermediate furrow; and so on over the field, forming the regulating drill on each ridge, so as to leave space alternately for three or four drills on each side of the intermediate furrows. In this manner the process goes on as if the ridges contained an odd number of drills, and the effect on the furrows is the same.

5. APPLICATION OF MANURES is effected chiefly by the cart; and that of farm-yard manure, previous to the formation of drills, is so well known that it is unnecessary to describe it. There is, however, a mode of applying a bulky commodity, such as compost of lime and earth, which I have found advantageous, and which is not generally practised.

The application of lime compost commonly takes place in autumn, or during frost in winter, and when not accomplished in these seasons, dry weather in spring may be chosen for the operation. In applying compost it is usual to commence at one side of the field, and complete ridge by ridge till the whole is gone over. In this way each ridge in turn is submitted to the pressure of the cart wheels and horses' feet passing to and fro, by which the pulverization of the field is materially injured. To avoid this I have been in the practice of chequering the field in the manner of a chess board, by marking the ridges across with the plough, and then reserving a ridge for a road, by depositing the compost latitudinally on each ridge. Suppose, for example, that three heaps of compost are formed from one cart-load. In this case the fourth ridge becomes a road, and the carts deposit compost across three ridges on each side—thus every seventh ridge becomes a road, and the pulverization of the others in a great measure preserved. By this mode of applying compost a firm road is soon formed, facilitating transport, and limiting the soil, the pulverization of which has been destroyed by pressure to a few ridges, which can be again restored to a fine tilth by a liberal use of the

plough, harrow, and roller, without disturbing the rest of the field.

Farm-yard manure, when applied to green crops, is commonly deposited in the drills at the time of sowing, being drawn from carts into small heaps, and spread into the bottom of the drills by boys and girls. To preserve accuracy in application the cart loads should be formed all of one size, and have a space marked off for the contents of each going over. The dung for each row of heaps may be apportioned for these four or five drills. A reflecting person will therefore vary the size of cart loads and number of drills to each row of heaps, as circumstances point out. The spreading of manure is best attained by marking off a cross section of drills for each individual. This affords opportunity of checking negligence on the part of the spreaders, and insures a regular and perfect application of manure, while each individual can be tasked to his ability.

The number of individuals employed in spreading, must be proportioned to those filling the carts.

A general rule cannot be laid down on this head, as much depends on the nature of the manure and quantity applied. In general, matters proceed with dispatch, when three men are loading and two emptying carts, the number of which is regulated by the distance of transports.

Having detailed a system of preparing soil for grain or fallow crops, which I have extensively practised for many years, and can testify to its efficacy, I do not, however, contend for its general application, as circumstances may occur to warrant its modification.

If I am right in stating vegetable prosperity to be checked by pressing soil, when met by undue exposure to evaporation, and want of pulverization, the application of steam power may accomplish much for British agriculture.

The present system requiring a progression of field operations, through almost every day of the year, they are often completest when the state of the soil is unfit for their execution, and every reflecting and candid farmer will admit, that much of the present labour required to extract root weeds and obtain pulverization, results from previous ill-timed operations. Steam power would admit of delaying operations till soil was in the best state for their execution; and the advantages of its introduction may be expected to result as much from beneficial effects on the soil, as from saving of labour.

P. S.

*Mungoswells, by Haddington.*

AGRICULTURE.—TRIFOLIUM INCARNATUM.—The following is a further testimony to the productiveness of this valuable grass:—"In answer to your (Messrs. Wrench's) question about sowing Trifolium in the spring, I have no hesitation in saying it answers exceedingly well, for, on referring to my book, I find I drilled two acres on the 7th day of April last year—on June 10th there was a very full crop; and, although a very unfavourable season, I cut it for seed in August, and have the grass now by me: the piece of ground where it grew has at present a very fine plant on it that siled from the former seed, and has had no preparation whatever.—G. K.—Trotsworth, 20th Feb., 1836."

IMPOUNDING CATTLE.—By virtue of an act passed last session, a person impounding cattle is bound to provide them with food, and any person entering for the purpose of attending to his cattle, is considered not guilty of trespass. This proviso is included in the act for preventing cruelty to animals.

## BEDFORDSHIRE.

*From Kennedy and Grainger's Customs and Practice of Tenancy in the different counties, published in 1828.*

In many parts of this county the soil is peculiarly well adapted for the growth of vegetables; and from its being naturally one of quick or early production, a number of acres are devoted to horticultural purposes, for the supply of the London, Cambridge, and other neighbouring markets. The county presents an alternation of gentle hills, and beautiful, extensive vales. The soil is generally sandy; it formerly, in several places, produced nothing but forest wood, but the greatest part of what used to consist of waste land and chases, is now cultivated, and is become very fertile.

The eastern side of the county is chiefly a sandy loam, with the exception of some spots where the soil is poor and hungry, and of the worst kind of clay. There is a limited proportion of grazing land in Bedfordshire, but the greater part of it is very good. The chief articles of produce in this county are corn and vegetables; and it is especially noted for early peas.

**PRACTICE OF TENANCY.**—The most usual time for entering upon a farm is at Michaelmas; but some takings are at Lady-day: the farms are most commonly let upon a short lease of seven years.

The rents are paid half-yearly: the highway-tax is half paid, and half worked out; the poor-rates are generally heavy; they are collected, in some places, once a month, or as often as the money is wanted. In districts where the land is chiefly used in grazing, the neighbouring arable parishes suffer much in consequence of the superabundance of hands, and the difficulty of finding employment for them. With regard to tithes, they are chiefly paid by composition; in some places, where inclosures have been made by act of Parliament, the tithes have been extinguished, in consideration of an allotment of land.

**CUSTOMS BETWEEN LANDLORD AND TENANT, AND THE INCOMING AND OUTGOING TENANT.**—A tenant is generally restricted from breaking up pasture land; he is likewise bound to feed all hay and straw upon the premises: this latter restraint is now much more general than it used to be, owing to the great inconvenience occasioned within a few years past, in various places, from the want of it: there are some farms, however, which are still free from the restriction; but as the leases terminate, it is generally imposed upon the new tenant.

With regard to the mode of farming—the quantity or rotation of crops, there is no general rule, nor as to the proportion of wheat allowed to be sown.

A tenant quitting at Michaelmas, is at liberty to plough and sow the wheat; and one leaving at Lady-day, to sow the spring corn; provided, in the former case, the grain can be sown by Michaelmas-day, and in the latter by Lady-day: the outgoing tenant, however, has the option, in both cases, of either sowing it himself, or of allowing his successor to come upon the land and do it instead.

When the outgoing sows the crops, they are generally valued to the incomer, so as to include all the labour bestowed upon them, provided he chooses to take them; but if he refuses them, the former is obliged to hold the land he has sown till harvest-time, and spend the straw of the crop upon the premises, having barn and yard room allowed him for that purpose. Where, however, a tenant is free from this restriction, the corn and straw are generally carried off elsewhere; but under either custom, the incomer has a right to make use of all the dung he finds upon the premises, free of expense, no pay-

ment for it being required. The incomer pays for the grass seeds according to their value, and that of the labour, and likewise for fallow-ploughing, or any spring-ploughing, which his predecessor, quitting at Lady-day, had not time to sow: but with respect to any fallow, either for wheat or turnips, when the outgoing takes the crop, there is no demand made upon the incoming tenant.

**MODE OF CULTIVATION, IMPLEMENTS, &c.**—Owing to the nature of the soil, turnips can be very profitably cultivated, and they are generally grown throughout the county, especially the Swedish turnip, which is produced in great quantities, and of very excellent quality. The rotation upon the sandy soil is—first, turnips; second, barley; third, seeds; fourth, wheat. On the loamy soil, beans or oats are generally sown after the wheat; and upon the clays, beans and wheat are the principal produce.

It is a very common practice to lay clay upon the land, which is found greatly to improve a sandy soil, and it is frequently applied as a manure for turnips, but it is requisite it should be spread out in the winter, in order that it may be purified by the frost: the clay, in many respects, changes the nature of the soil, and its effects continue to operate for many years. The drill is now much used, owing to the lightness of the soil; great part of the wheat is planted by the dibble, in the same manner as beans; and this practice has been proved to answer a better purpose than sowing or drilling, as the wheat finds a firmer rooting, and the ground does not require nearly so much harrowing, in order to cover the grain. Threshing machines are now much disused, being seldom seen in any part of the county. The plough which is now in most general use, is the Ipswich plough, with cast-iron tips.

With regard to the draining, it is chiefly laid in with bushes and straw, and generally at the expense of the tenant. The outbuildings, which are very neatly thatched and weather-boarded, are most commonly kept in repair at the charge of the landlord.

**THE CORN TRADE.**—(From the *Lincolnshire Chronicle*).—We are happy to say that our market hill was more numerously attended on Friday last, than for some time past. The demand for wheat and barley was brisk and the prices of the two previous markets were firmly maintained, so that we have a fair prospect of the continuance of the improvement effected in the last two months. Murmuring amongst the agriculturists, is becoming fainter and fainter, and will we doubt not, ere long die away. The principal thing now needed to give stability and permanency to the farmer's comforts, is a rigid attention to the following aphorisms:—

Hand to the Plough:  
Wife to the Cow,  
Boy to the Mow,  
Maid to the Sow,  
Will pay the Rent now:  
But—Man with his Tally-ho,  
Wife squalling Pian-o!  
Girl with her Satin-oh!  
Boy at Tatts or at E. O.!

Is splash, dash, and must end in ruin-oh!

**UNRIVALLED LINCOLNSHIRE SHEEP.**—Farmers, graziers, and others will have a famous treat at Brigg, on Thursday the 10th day of March next, as Henry Healey, Esq., of High Risby, will on that day have his extraordinary large sheep shown and slaughtered at the Lion Hotel. It is supposed he will weigh 73lbs per qr—and clip more than 14lbs of wool, and for symmetry and all that can be wished for in a sheep, he is allowed by judges to be without a parallel.

## ON FORMING NEW LEYS.

To the Editor of the *Irish Farmer's and Gardener's Magazine*.

SIR.—From a paper in the last number of your very interesting periodical, I have been induced, hastily, to throw together a few crude remarks on the subject of pastures, acquired from some degree of practical experience, which, from my observations and the general importance I am disposed to attach to it, appears to have claimed less attention than any other branch of husbandry.

From the great depreciation in the value of produce, I resolved, some years since, to convert the principal portion of my farm into a permanent sheep pasture; but differing very widely from the mode so generally adopted, of throwing out land to recover itself, (as it is termed) which, in this instance, it might, perhaps, have been thought could very well have been done, from my farm being at the time in a high state of cultivation—but as I was satisfied, complete success, with the greatest amount of profit, must mainly depend upon the most enriching preparation of soil I could attain to, accompanied by a clean course of tillage, for two successive seasons the land was cultivated with drill potatoes, and each winter, thrown into drills, to keep it dry, and expose as much of the surface as possible to the ameliorating influence of the frosts. I had been previously engaged, for a considerable time in making various experiments, in the produce, as well as early and late growth of different descriptions of grasses, and for the purpose of acquiring additional information, had corresponded with an eminent agriculturist in England, who I was aware chiefly directed his attention to this subject. By his reply I was happy to find he entirely coincided with me, in concluding that no grasses could be found to rival the cocksfoot, meadow foxtail, and tall smooth-stalked meadow grass, which, for the benefit of the practical agriculturist, I give in your English names; and which, in all my experiments, invariably proved, beyond all comparison, to afford the most abundant produce, throughout the entire season, and from their hardy nature, continuing to vegetate during the greater part of the winter. However, he recommended me to make an addition of some sweet vernal, dogtail, and fescue grass, which having obtained, I sowed two fields, one with the addition of these descriptions, and the other without, adding about 6lbs of perennial clover per acre. The quantity I use is from six to seven bushels per Irish acre, with this description of clover. The ground having been kept very dry by the drills, throughout the winter, it was in the highest state of till, so that I could avail myself of the earliest opportunity to give it a slight ploughing and harrowing to level the drills, and after a turn of the roller, the seeds were sown. It is most essential to have the surface as level as possible, so that the seed may fall evenly over the ground, which is never so effectually accomplished when put in after the harrow, as they lie in the hollows, and consequently come up patchy. After a double strike of the harrow, it was again rolled, and the work completed. The vegetation was most rapid and yielded an abundant crop of hay, which being carted off as soon as possible, was succeeded by a most luxuriant after-growth, which proved a seasonable supply for early ewes. I soon, however, discovered that the grasses I had been induced to add no way answered my expectation; for wherever they were found growing the verdure was scanty and the growth tardy and diminutive compared with the luxuriance

of those of my own selection; so that since that period I have never used any other description than the cocksfoot and meadow foxtail; for finding it very difficult, and being too often disappointed in not being able to procure genuine seed of the tall and smooth-stalked meadow grass, in London, I have wholly discontinued it, and now use an equal quantity of each. The principal part of my seeds are gathered in the neighbourhood, by women and children, at 4s per bushel; for being indigenous, they are found flourishing in great abundance every where around us. The abundant produce of my pastures soon satisfied me of the benefit of this system, which I have steadily pursued until now. Nearly the whole of my farm is converted into pasture; but I find it much preferable, as soon as the grass is sufficiently high for the scythe, to cut and carry it into the house for feeding, rolling it well immediately afterwards, which assists in giving the roots a firm hold of the ground, so that I never sustain any injury from feeding it down with sheep, when a good covering is left to protect the young roots from the influence of severe frosts in the winter. By this means the annual weeds, which, with all the care that can be bestowed, it is impossible to guard against, are entirely destroyed. The air being allowed a free circulation, encourages the growth of the delicate and backward plants, which otherwise would become choked by the closeness of the crop and weeds, leaving the ground in many places destitute of grass. I have sprinkled a small quantity of rape with the grass seeds, eating both down together; but the drops from the leaves, with the shade of the plants, proved more prejudicial than any benefit derived by either the land or the stock, added to the additional trouble of cutting the rape stalks, with the chicken and other weeds, which must be expected to spring up.

Those who may be induced to make a trial of this mode of culture will, I am persuaded, be repaid 100 per cent: and I venture to assert, will be rewarded by obtaining the most luxuriant pasture, with as close and even a turf in the second season as the oldest lea can afford.

Should these few hasty and undigested remarks be found deserving of insertion in your magazine, or any way prove useful to the agriculturist, who, while every other class of the community appear to be amply rewarded for their industry and exertion, are, I feel persuaded, weighed down and contending with complicated difficulties and discouragements, probably, on a future occasion, I may be induced to communicate some remarks on the failure of our staple produce of the soil, with the advantages resulting from the application of bone manure, which I have employed with great success in the cultivation of turnips. A DOWNSHIRE AGRICULTURIST.

ESSEX.—A PROLIFIC SHEEP.—An ewe belonging to Mr. J. H. Hudson, of Barnston, near Great Dunmow, which was itself lambd on the 1st April, 1830, has produced in the course of five years and eleven months twelve lambs, viz.:—On the 14th February, 1831, it lambd one, which being born on St. Valentine's day, the owner bestowed upon it the name of Valentine. On Good Friday, 1832, it again lambd one; this is called Friday. On the 4th March, 1833, it had two lambs, these were named Bob and Joan. On March 10, 1834, it again lambd two, these are named Tom and Jerry. On the 13th March, 1835, it had three, which the owner calls Shadrach, Meshach, and Abednego. On the 1st of the present month it again lambd three. The last six are alive and with their mother

## COUNTY RATES.

Through the kindness of our Armagh Correspondent we have procured the copy of a Petition to Parliament, forwarded from thence, the subject of which we consider of such importance that we lose not a moment in laying it before our readers, hoping that the country gentlemen who may still have to assemble in the Counties wherein the Assizes have not as yet been held may be induced to take up the matter, and support, by corresponding Petitions, the prayer for redress of the palpable grievance which the Gentlemen of the County of Armagh have put forth with so much temper and firmness, and which we are only surprised has not much sooner been brought under the attention of Parliament. The Grand Jury assessments in Ireland must amount to fully one million sterling, and the entire revenues of customs and excise of the kingdom are little more than three millions—so that the owners of property, in lands and houses, it thus would appear, are actually paying one-third more of taxation than any other class of persons whatever, which certainly is a grievance that ought to be redressed. Our limited space prevents us from indulging in further observations, and we shall therefore content ourselves with merely referring to the document itself, which will be read with interest, if we are not much mistaken, in every part of the empire, and perhaps may be the means of making the payers of county rates in England, who are aggrieved in somewhat a similar way, to take up the subject, and to unite in pressing it upon the attention of the legislature:—

“To the Right Honourable and Honourable the Commons of the United Kingdom of Great Britain and Ireland, in Parliament assembled.

“The Petition of the undersigned members of the Grand Panel of the County of Armagh,

“Humbly sheweth,

“That for a long period of time Grand Juries in Ireland have been made the medium of imposing taxes for the construction and repair of roads, building gaols, court-houses, bridewells, infirmaries, lunatic asylums, &c. &c., and likewise for the expense of maintaining the prisoners and patients therein, salaries of public officers, costs of prosecutions, &c., and for many other objects of a public nature.

“That the taxes so raised by Grand Juries for the purposes aforesaid, have been levied off lands and houses, according to an ancient rule of apportionment, without in any manner whatever affecting any other species of property.

“That by this other mode of taxation, the entire burthen falls upon the landlords of said lands and houses so taxed, and is a direct deduction from the value of their property and the income arising therefrom.

“That the grievance which landlords have thus a right to complain of as being subject to a taxation from which all their fellow-subjects are free, has already increased to such a degree, that the county assessments have in several places become nearly equal, or even more than the entire rent of the land so assessed amounted to sixty or seventy years ago, though the price of wheat is at present lower than it averaged then, or has ever done since.

“That your petitioners nevertheless perceive, that to the excessive taxation thus shewn already to exist, there is now a further addition to be made under the new constabulary act, for superannuation of constables, salaries of stipendiary magistrates, and an increased establishment of police when thought necessary by the government—all of which cannot fail ultimately to increase most materially the county assessments.

“That your petitioners, belonging chiefly to that class of the community which is thus evidently aggrieved, have for a long succession of years, been the passive instruments of carrying into effect this unjust

principle of taxation; but at length forced by the loud complaints which are made of, and to them—and the public feeling which has been excited by the increasing amount of the assessments they are forced to impose, your petitioners are induced to apply to your honourable house for redress, and most respectfully beg leave to represent

“That landlords, whether of houses or lands, contribute to the general taxation in like manner as any other class of his Majesty's subjects in this part of the united kingdom, and that it is evidently unjust, in the highest degree, to charge them solely for objects, the benefit of which all others equally enjoy.

“Your petitioners beg also to state, that it is not merely in regard to taxation the Grand Jury laws are defective; but are also most erroneous in principle, and inefficient in practice, as regards the repair of the public roads of the county, being that branch of the expenditure which more particularly falls under your petitioners' observation—in which respect they beg to refer to the evidence given before a committee of your honourable house on the Board of Works, during last session, page 279, by William Blacker, Esq. Your petitioners are also of opinion that a general turnpike bill should be passed, by which the enormous expense of separate local acts might be evaded, and the passengers be made to pay for the convenience and use of the public road he enjoys.

“Your petitioners likewise complain that the Armagh Grand Jury are now called on to repay a large sum, expended in putting the act, commonly called ‘the Million Act,’ in force; and they have been, in like manner, called upon formerly to repay government advances under the Cholera Act, and for which purpose they are sorry to perceive a demand is made upon the Grand Jury of the city and liberties of Limerick, to the extent of five thousand six hundred pounds sterling. And your petitioners further perceive that the introducers of sundry bills into your honourable house, for the employment and support of the poor, and building poor-houses for their accommodation, &c., all contemplate to raise the expenses thereof by means of baronial assessments, upon the same principle as Grand Jury taxation.

“Your petitioners, therefore, think themselves called upon most respectfully, but most decidedly, to protest against the principle of levying, by a partial assessment on the property of landlords, sums of any kind, whether large or small, for these or other objects, with which they are in no way connected more than any other class of the community; and they do earnestly entreat that your honourable house shall adopt some more equitable principle of providing for the public burdens, by which all may equally contribute to what all equally derive benefit from.—And your petitioners, as in duty bound, will ever pray.

A RARE COW.—The celebrated “Maddresfield Heifer,” the property of Mr. Payne, of this city, was put up by public auction, by Mr. Hobbs, at Bronwich farm, on Monday. There was a respectable and numerous attendance of company, but the heifer was not sold, the highest bidding being 54*l.*, at which sum Mr. Payne would not consent to part with her.—*Worcester Herald.*

## HORSEMANSHIP.

## THE FLYING LEAP.

The position in the standing leap is applicable also to the flying leap. It is easier to sit by an experienced horseman, because the horse's body preserves a more horizontal position, occasioned by the animal taking his spring at a greater distance from the lar and going further over—the rise and fall are not so distinctly marked. In consequence, the rider has no occasion to bring his body quite so forward when the horse's fore legs rise, as the spring from the hind legs immediately follows. Therefore, keep your body upright, keep your hand down, take hold with your legs in the manner described under the preceding head; and as the horse springs slip your breech forward, and your body will not fail to take the corresponding motion of leaning back. Let your body become upright, keep your knee and legs firmly grasped till the hind feet have come to the ground, bearing the horse's mouth nicely in your hand as he alights.

The horse should rather canter than go full gallop at a flying leap; and yet it should be done in a determined manner both by the horse and his rider: if the rider hesitate, or manifest any timidity, the horse will immediately perceive it, and will be very apt to swerve or refuse the leap, and consequently endanger the rider. Never allow your body to come forward even at the commencement of the flying leap, lest the horse should not come fair at it, refuse, or stop, in which cases, with your body forward, you would be very liable to be thrown. If the horse jumps willingly, allow him to take his own pace at it, if otherwise, take the horse fifteen or sixteen yards from the bar, place his head fairly towards it, touch him with the spurs just as he starts but not afterwards:—he will most likely trot a few steps, and strike into a short gallop for a stroke or two before he springs. If the horse be very sluggish, the smart application of the spurs just before you turn his head towards the leap, (but not when he is going at it), will not fail to give him the requisite animation. If you are suspicious that he will be likely to swerve, apply the right hand, as well as the left, to the bridle, by which means you will be much better able to keep his head straight; when the horse is about to spring, let go the bridle with the right hand.

A horse requires but little support from the hand till he is over his leap and coming to the ground; his head should be merely kept steady, till he is landing, when the support of the hand is highly proper, as it eases the horse, and also the rider, and assists in bringing the body of the latter upright.

Many persons, in taking a flying leap, elevate the right hand as the horse comes to the ground, which the riding master will say, throws the body out of square; but it should be recollected that the left hand is drawn a little forward by the horse's landing, and thus a counterbalance is presented. It amounts to little whether the right hand is elevated, but I never perceived that injury resulted from it.

## THE RESTIVE HORSE.

In a previous article, I spoke of vicious and un-

ruly horses, under which description the *restive horse* might be correctly enough placed; but, as there are many vicious and unruly horses, which, strictly speaking, cannot be called *restive*, so, I have thought it best to treat *restiveness* in the horse under a separate head.

*Restiveness* arises from a cowardly disposition or bad temper, which stubbornly refuses obedience where the horse perceives the rider has not sufficient skill to force or compel him to perform his wishes. *Restive* horses are very cunning, and are for ever on the watch for opportunities of putting in practice their evil propensities. They feel, as it were, for the firmness of the rider's seat and the strength of his resolution; and if they perceive that they are likely to be successfully opposed, they will wait till an opportunity and situation are presented where they can commence hostilities with advantage; and they are certain to defend themselves stoutly on the point upon which they expect to be attacked.

It will frequently happen, on bringing a *restive* horse out of the stable and mounting him, that, before he has moved far, he will breathe harder than usual, place his ears forward, and affect a degree of alarm; and at the first object which appears to suit his purpose, he will pretend to be frightened. He commences his attack by stopping, turning short round, and, if allowed, will return very quietly to his stable. Some *restive* horses select a windmill at which to affect alarm, others a house or building, others a tree, and so on; but not one of them will proceed far, if he perceive he has a timid and unskilful rider on his back, without selecting some object at which he may stare and startle as a prelude to his tricks, for the purpose of returning to the stable.

There are other *restive* horses, which will proceed quietly enough till they come to a public house, a stable, or a farm yard, to which they will go up; and, if opposed, will offer battle. Such horses are very dangerous in unskilful hands; as, if these are not suffered to proceed to the place which they have marked out to stop at, they will sidle up to the wall, rush into a stable or even a house if the door happen to be open, and that too with obstinate and determined violence. These efforts, however, are easily counteracted by skill, but not by the whip and spur; for, under these and similar circumstances, the use of the whip and spurs is worse than nothing:—and even should a very resolute strong man force a horse to obey by dint of mere strength, flogging and spurring, the horse seldom seems to think that he is completely subdued, but will, on the first convenient opportunity, try the matter again. It is the skilful, judicious, and well-timed operation of the hands which completely subdues the horse: twisting him about, confuses him, (as I have already observed) and when he is twisted round several times he becomes giddy, loses entirely his power of opposition, and obeys the rider's will. Let it, however, not be forgotten, that there is an awkward and an expert method of twisting the horse; and if the former mode is used, the contest will be prolonged, perhaps become doubtful, and at all events, place the rider in danger.

When a *restive* horse endeavours to force you

against a wall, &c. do not pull him from it, but *bend* his head to it, by which the side of the horse, next the wall, is forced into a concave position, and he is thus prevented from injuring the rider. The instant the horse is perceived sideling to any object, you may turn his head to that object, and back him from it, but bending his head to it is preferable. Should he rear, you will adopt the method already described for counteracting his efforts. But horses of this description seldom rear.

Most of these restive horses will go well enough in a town (except passing their own stable) but they will not go far from it, if they can avoid it. A friend of mine accidentally purchased a mare which he thought uncommonly cheap, and indeed the price was low. She was a handsome dark chestnut, and at his request, I mounted her for the purpose of riding her a few miles. She went very well in the town, but I soon perceived an alteration when I left it and was proceeding on the road. I fully expected she would prove restive, and I was not deceived. Yet we had proceeded nearly five miles before she offered battle; the contest did not last long, and she carried me very well the rest of the journey; but the owner, could not be prevailed upon to mount her in consequence of my report, but immediately sold her.

Many of these restive horses will go very well in company. A dealer once offered me a horse at what I thought a very moderate price; and I felt disposed to purchase him, if, after trial, he pleased me. He was a fine grey horse, the dealer represented him to be a superior hunter, and from his strength and form it seemed very probable. It was agreed that I should meet the hounds with him the following day, and the dealer accompanied me. All went on tolerably well till, in the commencement of the run, the dealer and I got separated, when he refused the next jump; and, although he afterwards took it, the time occupied in manœuvring him enabled the hounds to get so far ahead, that I was not able afterwards to reach them.

There is another description of horses whose obstinate disposition amounts to a species of restiveness. I purchased a little black Irish horse, which I rode for some weeks, several times after the hounds, and I was well carried. Happening, however, one afternoon, on my return home, to have a little business which took me out of the road, on attempting to turn down a lane, the horse refused. He reared in a trifling degree; then, placing his off fore foot in advance seemed to bid me defiance. I twisted him to the left several times, placed his head in the direction I wished to proceed, applied the spurs sharply, when he sprang into the gallop, which I compelled him to continue for several hundred yards, in the first part of which I administered the whip and spurs twice or thrice. The horse never attempted a similar prank with me; but got master of my servant, under similar circumstances, who was never afterwards able to ride him.

In all contests with the horse, the great object of the rider should be to counteract or frustrate the intentions of the horse, and protect himself from injury. As the horse is weaker on one side than the other,

so the rider may be said to be also; for instance, most men possess more strength in the right hand than in the left; more power of grasp on one side than the other\*; and an unruly horse has generally cunning enough to perceive on which side he is held the firmest, and will therefore attack your weak side: the horse will be found so well prepared on one side for resistance that it is not advisable to attack him on it. Instead of attempting to prevent his efforts on that side, pull him round on the other, and place his head in the direction you wish to proceed: the spur may be used, but seldom succeeds. On the contrary, the horse generally turns round again; and you, in like manner, attacking his unguarded side, turn him round two or three times, and act in the manner which I have already described, and it will very rarely fail to have the desired effect.

Some horses will stand still and obstinately refuse to go forward, in which case, if you cannot turn him round, rein him backward, which may be easily accomplished; and on no account contend with him on the particular point upon which he is prepared to dispute or resist. He must be foiled by counteraction. In cases where the horse can neither be moved forward nor backward, allow him to stand still, sit quietly on his back, and in the course of a few minutes, he will move forward. Whenever a person purposes to contend with a horse with a view to cure him of some species of vice, he should select a situation calculated for the purpose, a clear open space, where consequently there can be no danger of the rider being crushed against walls, trees or other obstacles. And it is necessary to remark, that restive horses are artful enough to take all advantages; and, where they can, will sidle to other horses, carts, rails, &c. Under such circumstances, let me repeat, turn his head directly to the object, and back him from it, but use neither whip nor spurs.

It should be the rider's object to discover the temper and disposition of the horse, by which he will be enabled the better to direct his movements. There are horses so averse in spirit that they may be whipped out of their tricks, others, (and by far the greater part) require different treatment; and I am by no means an advocate for the whip and spur under any other circumstances than where they are absolutely necessary; and, generally speaking, unruly horses are much better manœuvred and overcome without them.

When the horse shies at any object, let the rider keep his eye directed to the horse's ears. This observation should be steadily kept in mind, in all cases with vicious horses:—the ears are strong indications to the rider of the intentions of the horse.

I have often been much surprised that so very few persons seem to be acquainted with the astonishing efficacy of the hands in the management of a restive or unruly horse, and particularly of the masterly manœuvre of twisting round; the failure

---

\* The bone of the knee with which the rider grasps or presses more strongly will be found more prominent than the other; so it may be equally observed that, where the muscle is the most exercised it will be the largest and the most powerful.

of which I never yet witnessed! Grooms, and generally those whose principal business it is to attend horses, know nothing about the matter. How often have I seen one of this class upon a stubborn horse, display much more obstinate stupidity than the animal he was endeavouring to render obedient! In such cases, the whip and spur are vigorously and unmercifully employed, the rider is admired by the gaping crowd for his courage, the contest becomes doubtful and dangerous in the highest degree; and should the rider ultimately succeed, it may be considered as a respite, or suspension of hostilities: the horse does not consider himself subdued, and will not fail to renew the encounter at no distant period.

When a horse has been subdued, the rider should not exult in his triumph by administering the whip after the battle is over, and the horse has given in. A friend of mine, a year or two back, succeeded in rendering an unruly horse quiet, wherein he very injudiciously made a free use of the whip and spurs. The horse submitted, and the rider was requested not to apply the whip again; however, after he had stood for some seconds or a minute or two, he gave the horse another stroke. The latter recommenced the struggle, which he finished by throwing his rider! It then became a much more difficult task to render the horse obedient.

### PLUNGING.

I have already remarked that rearing is a most dangerous vice in horses; and the same observation will, in a great degree, apply to plunging; which, however, very fortunately, principally occurs at the period of breaking, when the animal is rendered incapable of doing much mischief, by the systematic preparations which are made for the purpose. No horse can continue plunging for any length of time, since the violent exertion necessary to produce it soon exhausts his strength. When a horse intends to plunge, he sets up his back, swells his body as if to break his girths, cringes his tail between his quarters, and in this position kicks and plunges as long as he can hold his breath; and since he holds his breath all the time, it is an operation which cannot last long. A horse cannot plunge more than five or six times before he must pause to breathe; and if he be unsuccessful, and the rider remains firmly seated on his back, his next attempt will be shorter, and he will soon give it up altogether. If, however, the rider should be unhorsed, the animal will try the experiment again as vigorously as possible.

With a plunging horse, the rider must take firm hold with his legs, and take care that the horse, in getting his head down does not draw the rider's body forward. There is no danger of the horse rearing; and therefore, if the body be kept well back, and the horse held firmly, the rider will maintain his seat, and the horse, if young, (that is, when breaking) may perhaps attempt to plunge for two or three days, but with decreased violence every successive time. One principal care of the rider should be, to hold the horse firmly so as to prevent him throwing himself down, which, should the animal get his head loose, would be very likely to occur. A horse, with proper treatment, seldom plunges violently.

There are, however, sometimes seen aged horses

which may be called vicious plungers. When one of this description commences plunging, the rider may sit out the fit of plunging, if he think proper; but, if he force the horse into a gallop after the first or second plunge, the business will be sooner brought to a conclusion, and with less risk to the rider. If the situation happens to be convenient, I would gallop the horse for half a mile or more, and give him the steel and the lash very freely for the first two hundred yards. He will not be much inclined to plunge afterwards with the same rider.

I have seen some brutes, when they could plunge no longer, make every effort to throw themselves down, and thus, if possible, to fall upon their riders. Generally speaking, however, horses are afraid of falling, and even when they throw themselves down in plunging it helps to subjugate them. But the moment they are on their legs, the rider should be on their back.

### THE RAT.

(From Johnson's *Vermin Destroyer, and Gamekeeper's Directory*.)

Of rats there are three distinct varieties found in this country:—the large brown rat, the black rat, and the water rat. They are all predaceous: they will destroy young game, young chickens, young ducks, and young pigeons. Their depredations on the labours of the farmer are well known, as well as the mischief which they commit in houses, warehouses, mills, &c.

We are told that the black rat was formerly very numerous in this country; but since the introduction of the large brown rat, their numbers have greatly diminished, being compelled to give way to their stronger and fiercer competitors. The large brown rat will form the principal object of consideration, an animal too well known to need minute description.

During summer they reside principally in holes on the banks of rivers, ditches, and ponds: but, as winter comes on, they approach the human habitations, and very often take up their abode in barns, corn stacks, &c. They have haunts or runs in the walls and under the floors of old houses, where they frequently injure the furniture; and they have even been known to gnaw the extremities of infants while asleep. They swim with ease and will dive after fish.

Rats increase very fast:—they will bring forth three times a year, and produce from ten to fifteen at a birth. They are numerous in most large towns; and though they seek the fields on the approach of summer, it generally arises from a diminution of food about farm houses, &c. as well as from the insecurity which they feel from the removal of the corn-stacks, the clearing of the barns &c. at the same time that plenty of food is presented abroad in the fields. When a colony of these animals happens to take possession of a field of standing corn, they make dreadful havoc.

These animals will attack young poultry, and even the old, if pressed by hunger; and their voracity is such that they have been known to fasten on the fatter parts of living stone; nor are infants in their cradle always free from their attacks. They will destroy young game, and, indeed, the rat may be regarded as a general marauder.

Rats become uncommonly bold from impunity, but they are easily destroyed or driven away when the proper means for that purpose are adopted. There are various methods of taking or destroying these creatures:—the most effective of which will be detailed.

The weasel tribe pursue the rat as fiercely as the hare; but the rat, unlike "the poor timid hare," does not resign itself to its fate: it is interesting to see the small weasel attack a large rat. The latter will get away, if possible; but finding escape out of the question, it turns upon its invincible assailant and fights while it is able, crying out all the time. From the active motions of the rat in this contest, as well as from its evident superiority in strength, a spectator might suppose that the business must end in the defeat or destruction of the weasel: but, after a time, the efforts of the rat evidently grow languid, while the weasel may be perceived sticking like a leech, its teeth fast hold of the rat about the head or neck. The battle lasts no great length of time; for, when once the weasel has got hold, all the efforts of the rat are not sufficient to dislodge it.

The ferret, it is well known, is in general use for the destruction of rats, assisted by the terrier; and this was a kind of business or employment followed by numbers throughout the country. These professed rat catchers, however, have very greatly diminished in numbers, as well as in repute, since it was often found that premises which they had visited, and had been paid for clearing, were seldom long without a fresh colony. The fact is, the men thus employed were suspected of turning down rats upon the premises for the purpose of obtaining employment. But professed rat catchers are still to be met with, particularly in sea-port towns.

I quote the following from General Hanger, afterwards Lord Coleraine:—"When I was aide-camp to my most worthy patron, protector, and friend, Sir Henry Clinton, then commander in chief at New York, one day, at dinner, he told Colonel Phillips that the rats were so numerous in his quarters, that he had been forced to have the bottoms of the doors lined with tin, for that they had very nearly eaten through the door where he kept his papers; and he asked Colonel Phillips if he knew of any person who could destroy them. Colonel Phillips, who was a loyal American in our service, replied, that some years before the American war commenced, a rat catcher who had been transported from England, came and lived as gardener with him, at his estate at Phillipsbourg, about twenty odd miles from New York, and a very good gardener and good servant he was. Colonel Phillips was requested to enquire whether this man was to be found within our lines. In a few days he was found, and sent to head quarters. I attended him to see that he performed his duty:—seven wooden fall traps were made—such traps as are used to catch vermin alive. These traps are called hutch traps, fall traps, and box traps; they should be made two feet high, eight inches long, and of a proportionate height and breadth, with a door at each end, and a bridge in the middle with a trigger to it, which, when the trap is set for catching, holds both the doors up, by keeping the handles

of the doors close down to the top, by a string which is fastened to the opposite side, and which is fixed by a flat piece of wood to a notch in the trigger, when the trap is set for catching. These traps are to be set in the main runs, in which the rats constantly travel from one room or out-house to the others:—first preparing them after the following method. Purchase half a pint of oil of aniseed, and half a pint of oil of caraways; those are two cheap medicines; now comes a third, which is very dear, but then only a small quantity is necessary, a bottle as long as your finger being sufficient: it is oil of Rhodium. This will cost about ten shillings. Dab the trap on each side *within* well, with the oil of caraway and oil of aniseed, and with the tip of your finger dipped in the oil of Rhodium, in four or five places—it is enough, as the oil of Rhodium has a powerful smell. The food with which the traps are to be baited must be thus prepared:—grate a very dry loaf of bread so fine that the rats cannot carry any of it away with them; and to every double handful put about ten or twelve drops of oil of caraways, by a few drops at a time, rubbing the bread between your hands well, so as to impregnate the whole. You should taste the bread, and be guided by your taste not to make the bread taste too strong of the oil of caraways. It is a mistaken notion putting oil of aniseed into the food; it will make the food too strong, and they will not feed freely. *Oil of caraways, and oil of caraways only*, must be mixed in the food. The doors of the traps must be fastened firmly up, so that they cannot fall down; then for the two or three first days, lay a table spoonful, spread about very near each door of the traps, and by degrees, put the food further into the traps. After a few days, you must lay a table spoonful *on the bridge of the trap only*. After this method you are to proceed until you observe that the rats, frequenting the traps constantly, run and feed freely; dabbing the traps every day with the oils. This will take eight or ten days. When you are sure that they run and feed freely, after the house is quiet, and every one is gone to bed, you may tile the traps up and begin to catch, reserving one spare trap near you, to put down in the place of any one you may take up with rats in it. You must leave all the doors open, sit down very quietly and listen. The doors of the traps, when they fall down, make a considerable noise, which you will distinctly hear. When you hear one trap strike, you must be prepared with a canvas bag, with a large mouth to it, so as to admit one end of the trap; hold the bag under the trap, whilst another person tilts the trap, with the lower end open, perpendicularly, and shoots the rats into the bag, shaking the trap well, and striking the sides of it with your hand. Open the upper door by degrees, look well, with a light, into the trap, to see that every rat be shaken into the bag; then gather your hands round the mouth of the bag, swing it, and then strike it very hard against the wall or floor, so as effectually to kill every rat in it. In this you must be very particular, for in it lies the very strength of the art. If you let even so little as one rat escape, either out of the trap or the bag, you will not catch one more rat that night; and you must fasten the traps firmly up, and begin to feed them again,

which will take four or five days at least. I forgot to mention that when you hear the doors of one of the traps fall down, when you take it up you must carry another trap with you, and lay it down exactly in the same place, putting a little of the food on the bridge. The first night the man and myself (for I sat up the whole night) caught very near three hundred. On the following nights he caught a great many more, and continued until he had totally freed the house of them, and, I make no doubt many of the adjoining houses also.

“A few days before this man began to prepare to prepare to catch, I said to him, Mr. Addison, if you will honestly impart to me this secret, I will give you two guineas. I judged it prudent, at the same time, to give him a *gentle hint*, that if he deceived me, the strong hand of power was with me, and I should recommend him to the care of the provost marshal at the jail for one month. The man very honestly replied—‘Sir, take these three bottles of oils, and I will tell you also how to make the food. I will not for four or five days come near the house: you shall anoint the traps yourself, and feed them also.’ I did as he had instructed me for five days; in the afternoon he called and asked for me; we examined the traps, and he then determined to begin catching that night, without doing any thing himself previously to the traps. This convinced me of his honesty, and that he had imparted the real secret to me.”

Having given this great rat-catching secret in the late General Hanger's own words, I will add an observation or two in the way of elucidation. He speaks of the expense of the oil of Rhodium; it is a dear article, no doubt: but, having tried the experiment, I have no hesitation in asserting, that it is not essentially necessary; nor, in fact, could I perceive any difference when it was altogether omitted; and at the same time, it may be justly remarked, that a small quantity only of either the oil of aniseed or the oil of caraways should be used—sufficient merely to act as a pleasant perfume, and by no means to make the odour very strong; the rat possesses powerful olfactory organs, or very acute sense of smell, and, consequently, what would be scarcely recognizable by the human nose, would make a powerful impression upon the olfactory nerves of the rat. These oils merely attract the rats from a distance by their powerful smell, but it is the *deception*, after all, which constitutes the great secret. The rats are led on by degrees, and at length become confident from repeatedly feeding with security, and are thus completely deceived. It is, however, a singular fact, that if a single rat happens to escape, it will be some time before any of them can be induced to enter the trap again. The rat which has escaped has some mode of communicating the danger, and the whole colony take the alarm. The rat is both a very bold and a very cunning animal; but, aware, from hereditary instinct, that he is the object of general persecution, and, as if conscious of the varied and superior means which man employs for his destruction, he becomes the most suspicious animal in nature.

But General Hanger's process is rather tedious and irksome. At the same time it may be justly remarked, that, if rats are fed in the manner de-

scribed, they may be taken without having recourse to the use of the oils. However, the method is impracticable under many circumstances, and the reader will find in a subsequent page, a much more easy mode of accomplishing the object.

When rats become very numerous on board ships, and it is astonishing to what an extent they will carry their depredations, stoving is frequently employed, which is securing all the hatches, stopping all holes and crevices, and making the vessel airtight, as it were; it is then filled with the vapour of burnt brimstone, or burnt charcoal in stoves; the rats are thus unable to breathe, and, consequently, die.\*

On the return of the Valiant man-of-war from the Havanna, in the year 1766, the rats had increased to such a degree, that they destroyed a hundred weight of biscuit daily. The ship was at length smoked, and six large hampers were filled with the rats which had been thus killed.

As it is not at all likely that rats can be entirely extirpated in this kingdom, so those who are troubled with them must not suppose that by destroying them once they will be for ever rid of these troublesome and mischievous vermin. Houses or buildings situate in the country are very liable to be visited by rats on the approach of winter; as their food becoming scarce in the fields, they naturally enough follow the corn home, or approach human habitations in search of subsistence.

My residence is in the country, and I have periodical visits of rats, and adopt the following mode of ridding myself of these uninvited and unwelcome guests. They come at the end of autumn, or beginning of winter, and at first are very shy; however, finding themselves unmolested, they soon become bold, even to an impudent degree. As soon as I perceive they are reconciled to their quarters, and have made one or more regular runs, I procure a handful of newly-ground malt, with which I mix a handful of good sweet oatmeal, and an ounce or an ounce and a half of arsenic.† I make the whole into a dough with water, and then into pills about the size of a pea or horse-bean. These pills I drop or throw into their holes, in a *seemingly careless manner*, taking care thus to place them out of the reach of poultry, dogs, pigs, and, indeed, of every living thing but the rats. The rats never refuse it. It would appear to create thirst, as the animals leave their holes in search of water, and on these occasions seem incapable of much exertion; they will suffer a person to approach and kill them.

The secret, in this case, as in the other, is the deception, though in a different manner; in the first case, their suspicion subsides from feeding for some time in security, and they are thus deceived; in the second case, the pills appear as if they had dropped in their way by chance. If you put the pills upon a plate near the mouth of their holes, or in any other formal manner, it is ten to one if a rat

\* Bugs may be completely destroyed in the same manner.

† If too much arsenic is used it will produce vomiting, and the rat will recover.

will touch them; but when the rat finds them, as it were accidentally dropped into his hole, or his run, he will eat them very greedily.

The quantity of malt, oatmeal, and arsenic, which I have mentioned will make pills sufficient to destroy hundreds of rats. It may happen that all the rats are not killed; be this as it may, should any of them have escaped the pills, they will not fail to quit the premises; and, indeed, if constantly served in the same manner, it would appear that their visits would be less frequent; for some years, I had more visits than one from rats during twelve months; these visits afterwards became annual; and it is now two years since a rat was seen about my premises.

On one occasion, by way of experiment, I allowed the rats to remain unmolested for a considerable period. They made their way under all the floors about the premises; they bred most numerous—one very large female burrowed into the ground immediately underneath one of my wooden dog kennels, to which a pointer was generally chained, and there formed a nest. My colony of rats appeared very flourishing; and the animals grew audaciously bold from impunity. It is true, the cat killed a few of them; but they did not seem to take much alarm from this; and, in fact, the cat after being severely bitten, testified but little inclination to meddle further in the business, as if overfaced by the numbers and audacity of the rats. I have seen them towards evening, not only approach the door, but come into the kitchen, three or four at a time. They made their way through the floor of the pantry; they might be seen in the horses' mangers, claiming their share of oats; they ascended to the pigeon loft: and I prepared some pills. On the third day after the pills had been placed in their holes, not a living rat was to be seen about the premises! Every one of them, however, could not have been killed, as I had not used a sufficient number of pills—not, perhaps, for one half of them. This is the easiest method with which I am acquainted of getting rid of rats. It requires no preparatory feeding; I have tried it many times, both on my own premises, as well as on those of my neighbours, and never knew it to fail. Good sweet wheat flour, mixed with arsenic, will answer the purpose; but as newly-ground malt emits a very fragrant smell, of which rats seem to be fond, I think it preferable to wheat flour. But neither the one nor the other will answer the purpose unless placed as already directed, that is to say, *in a seeming careless manner*. At the same time, let it be duly impressed upon the mind, that it should be so placed that nothing can reach it but the rats. Mice may be destroyed in the same manner; but the pills should be made smaller.

Should there be one hundred rats about the premises, I firmly believe half that number of pills would be quite sufficient to clear them. There would not be a pill for each, it is true, but those which escaped the poison would not fail to take the alarm, and would immediately decamp—further, they will not very soon return. I never used more than fifty pills, I think, to the largest colony of rats I ever encountered. This is, as I have already observed, decidedly the easiest, the most

speedy, and the best way of getting rid of rats. If employed on board ships at sea, the rats, when some of their fellows are poisoned, cannot quit the vessel. This amounts to nothing, as a few pills can be placed as long as any rats remain alive, and they will not fail to take them. If malt be not procurable, sweet wheat flour, or sweet oatmeal will answer the purpose.

If a pill or two be wrapped or twisted in a bit of paper, and carelessly thrown in the way of the rats, they will rarely fail to be thus deceived. Mice also.

A very worthy friend of mine, (now no more) employed a professed rat catcher to clear his premises of these vermin, which the man accomplished, but in effecting this desirable object, he poisoned a pig, three pea fowls, and an old favourite wild duck.\*

The steel trap and wire cage are used for catching rats, but seldom with much effect. If one happens to be caught, you will rarely catch a second. I have known them successfully caught with the hutch trap, with various baits, but they should be fed for several preceding nights. If fish, for instance is used for the bait, fish should be placed repeatedly in the trap, securing it so that the doors cannot fall. When their suspicion is completely disarmed, they will feed freely, and may be caught in the same manner as described in the quotation from General Hanger.

A gentleman travelling through Mecklenberg, about forty years ago, was witness to a very singular circumstance in the post house at New Hargard. After dinner, the landlord placed on the floor a large dish of soup, and gave a loud whistle. Immediately there came into the room a mastiff, a fine Angora cat, an old raven, and a remarkably large rat, with a bell about its neck. They all four went to the dish, and, without disturbing each other, fed together; after which the dog, cat, and rat lay before the fire, while the raven hopped about the room. The landlord, after accounting for the familiarity which existed among these animals, informed his guest that the rat was the most useful of the four, for the noise he made had completely freed the house from his own fraternity.

If a rat be caught, and his skin singed so as to cause considerable pain, and he be turned into his hole again, he will make much lamentation, and the rest will forsake the place.

Rats are supposed by some to possess the faculty of foreseeing danger. It is said they will quit ships which are in a sinking state; and it is related, that a traveller, in passing an old mill, happening to pause for some purpose, observed a large rat come from the mill, approach the mill stream, looking up and down in all directions, as if to survey it. It returned into the mill, and in a

\* My friend resided at a short distance from an extensive marsh much frequented by wild ducks. He kept tame ducks, and was surprised one evening to observe a wild duck amongst them in the yard. The wild duck attached itself to a young drake, they paired, and bred regularly. It resigned its unlimited liberty for love, and became quite tame; it had continued four years in this state of domestication, when it was unfortunately poisoned by the rat catcher.

few seconds emerged again with a number of smaller ones, they all plunged into the stream, and were lost to the traveller's view; the mill fell down before he got out of sight!

Rats are so voracious, that there is scarcely anything which they will not devour; they have been known to attack human beings when confined in a dungeon, and to kill and devour them. It is very well known that when rats have been met in numbers, so far from giving way, have compelled the passenger to fly before them.

A gentleman of my acquaintance who resides in a neighbouring town, and who is extensively concerned in the wine and liquor trade, was, about sixteen years since, very much infested with rats. Upon his premises there was a kind of apartment, made of brick, arched, with a large aperture at the top. This was converted into a rat trap, by placing a small board in such a situation that when a rat reached the end of it, where the bait was fastened, the centre became overbalanced, and the rat was precipitated into the vault below. The board, disencumbered of the weight of the rat, righted again; and thus in one night, forty-three rats were caught. In the morning, when the vermin were observed, one of the servants, a son of the Sister Island, immediately volunteered his services to dispatch them. A ladder was placed for his descent which the man desired might be drawn up the moment he reached the bottom. He had armed himself with a shillalah, and descended with the utmost alacrity, quite pleased with the business he had undertaken: the rats in the mean time had gathered themselves together at one end of the place. The ladder was drawn up; but no sooner did the poor fellow move one step towards the rats, than, setting up their backs and squeaking loudly, they flew at him with the utmost fury. The man was almost petrified with alarm; he was deprived of the power of using his cudgel, and those above lost no time in getting him out of the place. He was speechless for a short period; the poor fellow was killed a few weeks afterwards by a fall from an upper story; but during the short time which elapsed, he did not recover from the effects of the fright—such an effect had it made upon his mind! A terrier bitch was lowered into the vault, and the rats did not fail to attack her as soon as she approached them. She went to work, however, and killed the whole ultimately; but such labour did it appear, that she paused, and even lay down for a few seconds, as if for wind, before she had completed the business.

Notwithstanding the fierceness and courage of the rat, when he becomes captive he loses his spirit. Men are occasionally seen with a number of rats in a wire cage, into which they will unceremoniously put their hands, and take hold of the rats with impunity. It has been supposed there is some secret in this, and so there is; it is the following, the man puts his hand into the cage with confident firmness; the rats have lost their spirits with their liberty, and make no attempt to bite. However, should a person attempt the same manoeuvre in a hesitating or timid manner, the rats will resume courage from such timidity, and will not fail to seize his hand.

If when a rat is at large, he be seized firmly with

the hand, and grasped very strongly, he will not bite—in fact, he is thus deprived of the power.

Rats are numerous in London, and as their retreats are for the most part under ground, in the sewers, large and small, they are not easily destroyed—or, at least, they would be very difficult to exterminate. Some few years since, several criminals made their escape from one of the prisons in London, by contriving to get down into one of the main sewers,\* which emptied itself into the Thames. After they had pursued their subterranean route for some little time, their progress was opposed by rats, which appeared in such numbers, and attacked the culprits so fiercely, that they cried for help, and were at length taken up through one of the gratings, and conveyed back to prison.

“Some few years ago, an old man in the province of Scania (Sweden) proceeded alone in the winter season to fetch home some hay, which was stacked in a morass at some distance from his residence. In this, however, a great number of rats had taken up their abode, and had so excavated it, that when the poor fellow mounted to the top, he sunk down headlong into the middle of the stack, from whence he was unable to extricate himself. Two day afterwards he was found dead, and devoured to the very bones by these destructive creatures.”

#### KIRKALDY AGRICULTURAL ASSOCIATION.

[If our space would enable us to act in compliance with our wishes, we would give this report in full. Such not being the case we trust that the omission will be ascribed to the right cause.—ED. F. M.]

After the exhibition about 150 gentlemen friendly to the object of the association sat down to an excellent dinner provided in the Town Hall. The chair was occupied by Lord Rothes, who was supported on his right by P. B. Ainslie, Esq.,—Moubray, Esq., Rev. Mr. Murray, who said grace and returned thanks, Provost Landale, &c., and on the left by J. B. Fernie, Esq., of Kilmux, Mr. Tullis, Blebo &c. The croUPIERS were Mr. Henry Fergus, Links, Mr. Ballingal of Treaton, and Mr. Russell of Coul.

After the cloth was removed the following toasts were successively given from the chair, and enthusiastically responded to. The King—Tune, God save the King. The Queen—Tune, Juliana. The Princess Victoria and the rest of the Royal Family—Tune, The Lass o' Richmond Hill. The Army and Navy—Tune, Rule Britannia. The Kirkaldy Agricultural Society, and prosperity to it—(Drunk with all the honours, and one cheer more)—Tune, Lea Rigg. The President of the Society, Robert Ferguson, Esq., of Raith—Tune, Rendezvous. The Judges, who had that day so ably acquitted themselves—Tune, A man's a man for a' that.

Mr. Fernie of Kilmux, as one of the Judges, felt bound to acknowledge the compliment, and in the name of his brethren and of himself to return their best thanks for the mark of respect shown them. He was bound to say, however, that their duties had been

\* The main sewers are, I believe, sufficiently large for a man to stand upright, or nearly so.

comparatively easy, in consequence of the excellent arrangements on the part of their secretary and standing committee. The general appearance of the stock, notwithstanding the pressure of the times, was indeed most gratifying. He trusted that in awarding the prizes they had acquitted themselves to the satisfaction of all—they had, at any rate, he felt entitled to say, given their best attention to the subject, and acted with the strictest impartiality. (*Cheers.*)

The CLERK here read over a list of the subjects for which prizes had been awarded, and the names of the successful competitors.

The CHAIRMAN begged to propose, for the approbation of the company, the health of a gentleman whose name, he was sure in that assembly, required to be coupled with no eulogy of his—known and appreciated as his services were to the whole of them. He alluded to their excellent Secretary, Mr. Hutchison. (Mr. Hutchison's health was received with marked enthusiasm.)

Mr. HUTCHINSON said that he had certainly been most unexpectedly called to his feet. He begged to thank them, which he assured them he did most sincerely, for the great compliment they had paid him. He had always felt the deepest interest in their institution; and whatever tended to its prosperity, he could unaffectedly say was to him a source of much individual happiness. Having said this much he trusted that gentlemen would not be backward in the introduction of professional subjects. Agricultural improvement was naturally slow of travelling, farmers were entitled to hesitate before they embarked in expensive experiments, and it ought no doubt to be one of the great objects of such meetings as the present not only to combine the scattered rays of knowledge but to canvass freely the different opinions held on subjects not yet brought to the test of general experience. There were many subjects which had strong claims upon their attention, as the Chevalier barley and the Hopetoun oats—the discoverer of the latter, Mr. Sheriff of Mungoswells he was happy to have it in his power to say was present among them. (*Loud cheering.*) Again there was the subject of the Italian rye grass, a plant which few of them had as yet tried, but from which great advantages he thought might justly be anticipated. Another subject which he thought richly merited their attention was the selection of proper specimens of turnips from which to raise seed, a circumstance which if duly attended to by farmers, in place of the hap-hazard way they proceeded at present, depending for their supplies from general seed-dealers, he felt assured would make a difference in the value of the crops of many of them, of some 4*l.* an acre. He had taken it upon him to throw out these hints in the hope that some of the gentlemen present might be induced to enter upon the discussion of some of the topics he had referred to. If they did not, so much did he feel the importance of giving a practical turn to their proceedings, that however inadequate, he himself would venture to embark in it. (*Loud cheering.*) Meantime he begged to propose the health of a gentleman for whom they all entertained great respect and felt deeply indebted to—so much so that one of their number (Mr. Davidson) was understood to be ready to subscribe 500*l.* to build a monument to him. (*Great laughter.*) He need not say that he meant Mr. Sheriff of Mungoswells, the introducer, if not the actual discoverer of the Hopetoun oat. (*Drunk with enthusiastic cheering.*)

Mr. SHERIFF believed that there was not a farmer in the whole world who would not be proud to receive a compliment from such a meeting as the present; but to him, who had no individual claims upon

them, it was indeed most gratifying. He begged to tender them a thousand thanks.

Mr. J. PRENTICE next proposed "The successful candidates." (*Drank with all the honours.*)

Mr. DAVIDSON returned thanks.

The unsuccessful candidates were next toasted.

Mr. R. STOCKS rose to propose "The health of Lord Loughborough, the Vice-President of the Society, and the Members of the Committee."

Mr. James RUSSELL, Coul, returned thanks.

Mr. R. BALLINGALL, Treaton, claimed a bumper to the health of their noble chairman, Lord Rothes—a nobleman who resided among them in his native county, and devoted no small portion of his energies to agricultural improvements. (His Lordship's health was drank with great applause.)

Lord ROTHEs said, that although he was as yet but a young and inexperienced agriculturist, he assured them he took great interest in rural pursuits, and was particularly delighted in having the honour to belong to the Kirkcaldy Agricultural Society, of which, from the specimens already afforded of its infantile prowess, the most magnificent hopes might justly be entertained of its adult maturity. (*Cheers.*)

Mr. HUTCHISON rose to propose that they should toast the Landlords of Fife. He need not say that the Fife lairds were a highly respectable and influential class of individuals, and one whose interests were in many respects identified with those of the Fife farmers. He thought, however, that on such occasions as the present, it had been too much the custom to turn forward only the bright side of the picture, and entirely to overlook, if not to cover up, those parts which were more darkly shaded. Such a mode of procedure, he need not to say, was injurious to the landlords themselves. It tended to confirm them in their prejudices, in place of affording them the means, as an impartially drawn picture would do, of rectifying their errors. (*Cheers.*) He verily believed that there was not a landlord in Fife, nor any where else, who did not think himself a good landlord, and who was not generally found ready to rise up and say, that his invariable maxim was to live and to let live, although, notwithstanding, his tenant judging not from words but practice, might come to a very different conclusion. (*Great cheering and laughter.*) There were no doubt, on the other hand, cases the reverse of this where the landlords were less prone to boast of their good deeds than to perform them, and where they had generously come forward and agreed to commute their money into grain rents. (*Cheers.*) Did he condemn the individuals who refused to depart from their bargains? No; he condemned the system which placed the tenants at their mercy. He was not one of those who advocated partial reductions of rent; such reductions were generally inadequate, and the system had proved the curse of the tenantry. What was the fact—had it not encouraged men to come forward and make offers for farms—ay, such offers as they knew very well they had no rational prospect of fulfilling, but they trusted, forsooth, to the clemency of the landlord. (*Hear, hear.*) Such a system could not be too strongly condemned and reprobated. (*Cheers.*) It was entirely destructive of the independence of the tenantry, and, if persisted in, could not but prove fatal to the dignity—nay, the respectability—of the agricultural profession. It was, moreover, highly injurious to the good relationship which, it was exceedingly desirable, should always exist between landlord and tenant—the former, in respect to the latter, sunk his right of choice in the indulgence of a mercenary spirit far too short-sighted to prove otherwise than ultimately highly disadvan-

tageous even to his pecuniary interests. Was it to be expected in such a case that the parties would long remain on a good footing with each other? The thing was impossible; for each having indulged in false hopes, mutual disappointment and personal dislike became the inevitable result. Here, then, was the root of much evil, but how was it to be remedied? He would say, let the landlord learn to know the value of his land—let him fix his rent as a merchant fixes the selling price of his goods, and wait the arrival of a respectable customer. (*Cheers.*) He knew that many landlords already acted upon the principle he had indicated, and he would say long may they continue to do so, as he felt firmly convinced that it was only by some such plan that a respectable tenantry and a proper system of agriculture could be maintained. But when he spoke of the landlord fixing his rent and choosing his tenant, he meant that all this should be done in a fair and liberal spirit. He did not certainly intend that the laird should screw up the darling object of his choice to a rack rent. (*Laughter.*) Before he sat down he might be permitted to notice one example of liberality on the part of a landlord which, he had no doubt, would afford them much pleasure. Lord Murray had that day presented to their society, through the hands of Mr. Ainslie, a donation of twenty pounds. He did not value the money so much as the spirit in which it was bestowed. With their leave, he would, therefore, join with “The Landlords of Fife the name of Lord Murray.” (*Drunk with enthusiasm.*) Tune—Garb of Old Gaul.

Mr. AINSLIE felt himself unexpectedly called upon to return thanks in the name of his noble relative and the Landlords of Fife—he said unexpectedly, as he was not at all aware, nor did he expect, that the donation he had handed to their Secretary in the forenoon, in the name of Lord Murray, would have been adverted to. He might be permitted, however, to avail himself of the opportunity thus afforded to make one or two remarks by way of reply to the speech of their worthy Secretary. That gentleman had told the landlords well of their duty, and to act kindly to and encourage their tenantry. Such kindness, however, he looked upon as by no means disinterested, as he held that it was utterly impossible to separate the interests of landlord and tenant, which were indeed as closely combined as any two interests could well be. He would say, indeed, that the landlord who was not kind and indulgent to his tenantry committed suicide on his own interests and happiness. (*Cheers.*) He felt pleasure in observing the manner in which allusions to the new practice of grain rents had been received by the company, and he felt confident that no one who reflected at all on the subject, but must admit that the principle involved in it was the fair and honourable one. It was, indeed, the only tenable principle—that of *mutual advantage*, which constituted, he would say, the backbone of agricultural as well as commercial transactions. What were the relations between landlord and tenant? The one bestowed his capital and industry, and the other his land; and was it to be supposed that the former was not entitled to live without abject dependence upon the latter—nay, he was entitled to much more—he would say that he was entitled, not only to enjoy a state of moral independence, but to thrive and become rich. (*Cheers.*) He would repeat that grain rents constituted the only common sense system, because if the one party prospered the other shared in the advantage, while, on the other hand, when there was loss it was but fair that both should participate in the suffering.

Mr. FERNIE of Kilmuch said, that a toast had been

shortly before put into his hands, in the introduction of which he could scarcely expect to be able to do justice. It was the Farmers of Fife, and the cause of Agricultural improvement. Being a farmer himself he was certainly entitled to speak of that class, nor was there anything in his relationship to prevent him from telling his mind as others had done, as to what he thought of the duties of a landlord. (*Hear, hear.*) He knew well that the tenants had performed their duties to the letter. They had a great deal to struggle against. The manufacturer when hard pressed generally was enabled to bring machinery to his aid, but this was impossible with the farmer, who, nevertheless, had done every thing he could, he felt assured, to meet his obligations, as he had done a great deal in improving the aspect and increasing the crops of the country. It was an acknowledged fact that the agriculture of Scotland surpassed that of every other country in the world. He himself in observing the agriculture of other nations had seen abundant evidence of it. Now he would like to know to what this superiority was owing but to the greater capital, skill, and energy of the tenantry. It was painful, however, to think of the sufferings of this meritorious class, and he trusted he might anticipate with Professor Nichol the speedy arrival of a time when the term agricultural distress would be again unknown. (*Cheers.*)

P. B. AINSLIE, Esq., rose to propose “The Commercial and Manufacturing Interests of the County.” They had already drunk to the prosperity of Agriculture, and to that most important element of it, the Tenantry, and they had already heard the sentiments of Mr. Fernie as to the superiority of our agriculture over that of other countries, and how much that superiority was owing to the skill and ability of the Scotch farmer—sentiments in which he most cordially agreed. There was another interest, however, to which he was going to call their attention, and situated as he then was among intelligent and liberal-minded men, he would fearlessly say that it was not inferior in importance to that of agriculture itself, or any other interest whatever. (*Hear, hear.*) He stood before them as a British merchant of thirty years' standing. Until within the last twenty years the commerce of Great Britain has been comparatively insignificant. Now, however, our manufacturing and commercial system had risen to vast magnitude. (*Loud cheers.*) We had become the emporium of the world, and exchanged the products of our industry and enterprise with those of almost every nation under the sun. It therefore appeared to him worse than folly on the part of agriculturists to endeavour to undervalue the immense importance of our commercial greatness. Indeed commerce was the handmaid of agricultural prosperity; and he had no hesitation in saying, that every improvement which took place in manufactures or commerce was a positive gain to the agriculturist; as, on the other hand, every discovery in agriculture, by increasing and cheapening the necessities of life, became an immense boon to the commercialist and manufacturer. (*Cheers.*) He would say, then, that the three great interests of this country—the commercial, the manufacturing, and the agricultural—were indissolubly united; and that no misfortune could overtake the one without being felt by the others. To go minutely into the grounds of this opinion, however, would lead him further than at present might be expedient. (*Cries of “No, no!”*) Did they want, then, an exemplification of the important relationship in which commerce stood to agriculture, he would refer them to the example of this very town. Within the space of a mile and a half around where they sat there

might be congregated together a population of some twenty thousand human beings, immediately dependent on commerce and manufactures for their daily means of support. Now, supposing that each of these consumers of agricultural produce, taking the estimate of the Edinburgh Review, the value of 8*l.* annually, here they had a market provided by the town of Kirkcaldy alone, at the very doors of the Fifeshire farmers, which afforded them customers for an amount of agricultural produce, equalling in value 160,000*l.* per annum. But suppose that by any means the purchasing power of Kirkcaldy could be augmented to 200,000*l.* annually, was it not clear that the agriculturists would participate in the advantage? (*Cheers.*) He would now repeat that in his judgment the interests of agriculture could not be dis severed from those of commerce; and it argued either weak heads or bad hearts on the part of those who would say any thing else.—The toast was drank with loud and prolonged cheering.

Mr. WILLIAM MILLIE had listened with intense delight to the prodigiously luminous speech of the gentleman who had just sat down, and, as a manufacturer, felt called upon to respond to it. As to agricultural distress, he could boast that he knew a little of farming. He had spent part of his youth with a worthy grandfather, who used to say to him, "Be aye stepping about and looking on, Willie, lad; and nae doubt but by and bye you'll learn." (*Great laughter.*) Now, although he had not altogether neglected his worthy relative's injunction, there was one part of the science which he confessed he had not yet learned, and that was how to make money by farming. (*Cheers and laughter.*) He need, therefore, scarcely add, that his wonderment was less at the farmers complaining of exorbitant rents, than at how the deuce they managed to pay any rent at all. (*Laughter.*) But a great many means had been suggested for the relief of agriculture, and, among the rest, a committee of the House of Commons had been appointed to inquire into the subject. That committee consisted of twenty-five Englishmen, four Irishmen, and four Scotchmen; and this he took to be a great compliment to the Scotch and Irish—the Parliamentary estimate obviously being that any four of them were equivalent, in point of work, to no fewer than five-and-twenty John Bulls. (*Cheers and laughter.*) Among the rest of the conjunctures on agricultural distress, there had been a great deal of talk about the currency. Now, so far as he could divine, *the currency and the comet were about equally related to the subject*, and he confessed both to be much beyond the reach of his mental powers to grapple with. What he really believed to be the cause of the depressed condition of agriculture was simply this,—that somehow or other *the supply of produce had become more than equivalent to the demand for it*; and, although the landed interest might, perhaps, at present be envying the situation of the manufacturer, he could assure them that the latter from a like cause had often his seasons of difficulty. He was not inclined to say much more on the subject, for, like a worthy clergyman, he held it be good policy always to leave off while his hearers yet retained an appetite for his discourse. (*Laughter.*) He might mention, however, a circumstance which would seem to indicate that there was at least one branch of agriculture now beginning to pay better. When in Cupar market yesterday, he had seen a gentleman who had sold four cattle for sixty pounds, which in April had been purchased for twenty-five pounds. Now, he would beg of them to contrast this with last year, when they were devilish glad to get back, after feeding the animals for some three or four

months, the same price which they paid for them. Nay, he himself had purchased a lot, and netted exactly a guinea of loss upon the head of them. (*Laughter.*)

Mr. HUTCHINSON said, that as he understood that Mr. FERNIE, of Kilmux, had experience of the Italian rye-grass, he should like much to be favoured with that gentleman's observations on the subject.

Mr. FERNIE said, that he scarcely felt justified on entering upon the question at the spur of the moment, he had much rather write upon it. Upon the whole he certainly entertained a favourable opinion of the Italian rye-grass, and thought it would prove a great acquisition to those who kept sheep. He had sown out three acres giving to each six pecks of seed. He conceived it was apt to grow rather thin, and would recommend two bushels of seed instead of six pecks. His crop did not seed well, and it was a grass he considered which was very apt to shake, and therefore which required to be cut early. His was rather neglected, he being from home on permanent duty at the time. (*Laughter.*)

Mr. HUTCHINSON, from his small experience, entertained very high hopes of the Italian rye-grass. The plant with him soon distinguished itself over the common sort by its greater greenness and freshness, and so marked was this, that during winter the difference might be perceived at a mile of distance. Mr. Moon, who was with him in February, pulled a handful of this grass which measured from his wrist to the points of his fingers, while the common sort did not exceed the length of his little finger. Where the two grasses were sown with clover—in the one case he saw nothing but clover, and in the other nothing but Italian rye-grass.

Mr. SANG.—As they had just been engaged in discussing the merits of the Italian rye-grass, he would state to them that three years ago he sowed a pound and a half of it. It was then uncommon, and he had from it a crop of seed by the end of June. After that he allowed the stubble again to rise, and he had another crop the same year. The year following he had two crops, and this year it appeared to him to promise nearly as well, only he thought that it was somewhat thinner, and perhaps from the readiness of the plant to shed its seed, the spaces were even to a considerable extent filled up with young plants. He (Mr. S.) considered the Italian rye-grass as one of the best and sweetest grasses which had yet been introduced. He suspected that Mr. Fernie's soil may have proved too strong for it, as it seemed to require soft and easy land. He had plenty of Italian rye-grass seed for sale—(*hear, hear*)—but he was going to say that his seed was much inferior to a sample he had seen that day in the hands of Mr. Davidson, of Burtisland, which, in point of quality he did not believe was surpassed by any seed in Great Britain. He thought that the quality of the seed was of still greater consequence than the quantity sown per acre.

Mr. FERNIE agreed with Mr. Sang, that the plant in question had a tendency to grow rather thin—to length rather than to branch off so as to give a body and thickness to the crop. He thought that in order to be used with advantage, the seed ought to be mixed with the common sort. The field on which he sowed the six pecks per acre consisted of a soft rich soil. He had, however, sown some of the same grass this year on a portion of his very worst land, so that his experience would shortly include the two extremes in that respect.

Mr. R. STROCKS rose to propose the health of Mr. Ainslie. As an example, shewing how much agriculture was indebted to commerce, he would instance

land in the neighbourhood of Kirkcaldy that now gave 41. and 51. of rent, but which in his younger days yielded nothing but birds' nests. (*Laughter.*)

Mr. JOHN HAIG had been entrusted with a toast to propose. It was the Highland and Agricultural Society of Scotland, and the sister societies of the county of Fife. The Highland Society was a society such as he verily believed no country in the world but Scotland could produce. There was no similar society in England. Aye, to be sure they had lately got up their grand Central Agricultural Association—(*laughter*)—an association which aspired to be a board of control over the government. (*Cries of "No, no," and "Yes, yes."*) It was an association which had drawn its first breath in politics—an atmosphere poisonous to the existence of such an institution, and whose mortal remains would ere long be consigned to the grave. (*Habbub.*) But it had been the wise practice of the Highland and Agricultural Society never to interfere—never once to touch upon politics—the under currents of which had been entirely left by it to contend for mastery among themselves. Its grand and beneficent object was simply those magnificent results which flow from the improvement of the soil of our native land. Into that soil it had struck its roots, and sent forth its buds and branches, giving noble indications of fruit many days hence. (*Cheers.*) He could talk for an hour on the subject of the Highland and Agricultural Association. (*Cheers and laughter.*) But he would not venture to intrude so long upon their time. (*Cheers.*) They had that night already heard of the beautiful union which existed between agriculture and commerce. They had heard the glorious and philanthropic sentiments of Mr. Ainslie in words so divine, that it seemed as if they actually proceeded from the other world. (*Immense laughter.*) He would say that Mr. Ainslie's opinions smacked strongly of the liberality of the south. (*Cheers.*) Our agriculture was comparatively unfettered. *We had no local taxes, no county rates, no tithes.* It seemed, therefore, that our agricultural system was less involved and more simple in its nature than that of our southern neighbours. All the burdens he had just adverted to, *by the wisdom of our forefathers, had already been wisely turned over, not upon the landlords, but upon the land.* The whole question of agricultural distress with us, then, *resolved itself into an affair of rent.* (*Cheers.*) The increasing practice of adopting grain rents would no doubt prove so far salutary; but let it not be supposed that it was enough merely to have grain rents. It was possible for landlords to drive too hard bargains even with these. They must not only have grain rents, but *grain rents on a fair and moderate footing.* (*Loud cheering.*)

At eight o'clock, when we left, the card of toasts was still unexhausted, the ranks of the company little thinned, and the current of eloquence flowing strongly onwards.

## ON THE APPLICATION OF THE POINTS BY WHICH CATTLE ARE JUDGED, TO THE FIFE BREEDS, &c.

BY MR. JAMES DICKSON, CATTLE-DEALER, EDINBURGH.

(From the Quarterly Journal of Agriculture.)

The ordinary breed of cattle in Fife is called "Fifehire Runts." The old celebrated breed is called the "Falkland" breed. Falkland used to be the favourite hunting seat of the kings of Scotland, and in that neighbourhood the stock used at the royal table were kept. It is said that the Falkland

breed derived its origin from the Devon, Sussex, or Hereford cattle, some of which had been imported into Scotland by royal command. Be the origin what it may, it is not unlike those breeds in form and character. The Fife Runts have a rather ragged outline, the line of the back being below the level line, and not straight, the general symmetry not being equal to that of the Angus or many of the northern breeds. The legs are rather long, and bone coarse; the hair is smooth, and the skin handles rather hard; the horns are long, flat, and thick; the features of the face are strongly marked, and in expression rather dull. Their general appearance is opposite to gaiety. As might be expected, after this description, they have not an aptitude to fatten at an early age; but, when aged, from three to five years, they feed to great substance and heavy weights. They are useful for ship beef. This description applies to the presently prevailing Fife-shire breed, but the old breed which is now uncommon in that county, is of a much finer description. They are finer handlers, have finer bone, more gay in their appearance, having the horns long and sharper pointed; more beautiful symmetry, better quality of beef, and greater aptitude to fatten than the present breeds. When aged, the common breeds feed to great weights, but it would be of no use to attempt to feed them when young, as they are deficient of quality and aptitude to fatten. Some of the very heaviest cattle bred in Scotland are bred in Fife-shire; but I must say they want many good points to make them profitable cutters to the retail butchers. They are much better suited to the shipping butcher. In the fat markets at Cupar in spring, I have seen many large lots of well fed cattle, but quality and symmetry are not to be looked for in the common Fife breeds. The butchers, however, are seldom deceived by them, as they are general good weighers.

The cattle of Kinross-shire is much the same as those in Fife, and so are some in Clackmannanshire. Many of them in those counties are fed at distilleries, such as by the Messrs Yong at Burntisland, Mr Stein of Killbeggie, Mr Moubray of Cambus, and others. The refuse from the malt distilleries has not the feeding properties of that from raw grain. The saccharine matter in the grain is almost wholly extracted by the process of malting; but the processes of the distiller, however ingenious, cannot extract the whole nutritious matter from raw grain. This great difference in the nature of distillery refuse make a similar difference in the quality of the beef fed on it. Malted refuse renders the beef and tallow soft, and unlike to well fed beef; whereas the refuse from raw grain fattens as well as Swedish turnips, both as to weight, fatness, firmness, and quality. Hence, at the latter distilleries, stakes for tying up cattle to feed let much higher than at the former. Fine beasts are thus fed by Messrs Haig at Lochrin distillery, near Edinburgh.

On comparing the old or Falkland breed of Fife with the present breeds which cover that county, its superiority is very apparent; and its character was well exemplified by the large ox which was shewn by Mr Bruce of Kennett, and which gained the premium for the best ox exhibiting the greatest weight, symmetry, and fatness, at the Highland Societies Show at Stirling in 1833. Negligence or oversight alone in the breeders of Fife must have deprived them of the good old breed for the present inferior race of cattle. It is satisfactory, however, to observe that they have become sensible of their error, for now breeding stock of the old breed are increasing in the hands of many breeders in various parts of the country. Colonel Lindsay of Colcarres, Mr Russel

of Balwhargh, Mr Fernie of Kilmux, Mr Thompson of Pusk, and other spirited farmers, have now breeding stock which realise good prices.

Good as certainly the old breed of cattle in Fife is, still the lower portions of that county are admirably adapted for the rearing of short-horns, which are indubitably a superior breed of cattle to either of the Fife breeds. It is not easy to account for the aversion to short-horns, which most of the breeders in Fife have no hesitation in evincing. Had this aversion arisen from a disappointed experience in short-horns, there would be some reasonable ground for maintaining it; but when it is well known that good thorough bred short-horns have never yet got fair play in that county, I cannot but choose to ascribe that aversion to prejudice. Some breeders no doubt have tried what have been designated short-horn cattle; but most of them which I have seen in Fife have only the name of that breed, but do not possess its characteristic properties.

TO THE WEST HIGHLAND BREED.—With the exception of the aboriginal breed of cattle, a few of which polled, and of a dingy white colour, are still to be seen in the park of the Duke of Hamilton at Cadzow, the West Highland or Kylee breed is the oldest in Scotland. Its primitive site was probably in the Hebrides in the Isle of Skye, where it had long been kept from intermixture with the breeds of the mainland, by the independent position which the chiefs of the Hebrides affected to maintain against the kings of Scotland and Norway. Be that as it may, the purest Kylee blood is to be seen in the Isle of Skye to this day; not that it is in Skye that the largest of the breed is found, for the richer pastures of Ross, and Perth, and Argyllshires have promoted its growth to a considerable size; but, when any breed of kindred blood is desired to be improved, the smaller and purer race of Skye is always resorted to for the purpose of improvement. It is pleasing to observe the desire for retaining the blood pure so universal among the breeders of West Highlanders. Besides the qualities of the bull, great attention is paid in selecting fine cows, which will hardly be parted with at any price so long as they are capable of vigorous reproduction.

The character and properties of West Highland cattle are much to be admired. The back is straight and level, the carcass deep, with the brisket well forward, and wide, and the buttocks well filled up. The top of the back is broad, and its breadth is preserved from the rump to the top of the shoulder. The legs are short, with a strong broad fine bone. The muzzle is fine, with the nose a little turned up, the eye full and sparkling, the ears thin, broad, and hairy, and pricked, and the head surmounted with wide-set, fine long tapering sharp-pointed white horns, gaily set off at the points, the tips being black. The coat is shaggy, with long fine soft hair, not the least curled, and the top of the head, mane, dewlap and tail-end ornamented with the same kind of long hair. Colours are black, sometimes red, dun, and brindled, all of a rich hue. The skin is mellow, and the touch kindly. They have great aptitude to fatten at an early age, laying the beef, which is of the finest quality, on the most valuable points. Taking them all in all no breed which I have yet noticed approaches in character and properties so near the short-horns as the West Highlanders. The climate of that part of the country which they inhabit is not cold, but wet and boisterous; and, as a suitable protection against the elements, their shaggy coats are well adapted. They are first-rate grazers, feeding on grass with great rapidity on their native pastures, and, when they are brought into the arable

districts, they thrive equally well on turnips. The usual weight which they attain, when fat, is from thirty to fifty stones, according to the size of the particular variety, for there are several varieties of them among the Western Isles. These varieties also exist as breeding stocks in Argyll, Perth, Stirling, Dumbarton, Ross, Inverness, and Sutherland shires. In every situation they are the finest *native* breed of cattle in Great Britain; for a combination of quality of beef, aptitude to fatten, and purity of blood. Should they be fed on from the time they are dropped, they could be disposed of in fine fat condition at three years' old, at from forty to fifty stones.

According to the present system of farming in the Western Isles, the pastures are overstocked in summer, and the young cattle are starved in winter. Could this system be altered, so as always to be increasing the condition of the cattle, the breeders would very much serve their own pecuniary interest, and promote the health and comfort of their cattle. Thousands of these cattle are presented to market every year, and fed and slaughtered in every part of Scotland and England, to the southward of their native latitude. They are generally presented in lean condition; but would the breeder relinquish the overstocking system, they would, on the whole, draw more money than they do, and command at all times a ready market; for purchasers will be found for such fine cattle in the worst of times, when the coarser and larger breeds would be neglected. When fat they are beautiful cutters up for the retail butchers, and are excellent for summer killing, and profitable for family use. The beef always fetches the highest price per stone in the markets.

I may mention the names of some eminent breeders of West Highlanders. Mr. M'Donald once had fine specimens on the far-famed Island of Staffa, the interesting resort of summer visitants: as also his late father, Mr. Colin Macdonald of Boisdale in South Uist. In 1812 and 1815 Staffa sold his three years old at Dumbarton at thirteen and fourteen guineas a-piece. Having kept a score of his three years old, he sold them in 1814, when four years old, at Dumbarton, to Mr. Wilson, factor to the Duke of Hamilton, for twenty guineas each. At this time Staffa kept from eighty to a hundred breeding cows. In 1815 he sold a bull for 130 guineas, for which he refused two years before 200 guineas; and about the same time he received 100 guineas for another bull. These prices certainly indicate that Staffa's stock were of a very superior description, and that he must be classed amongst the most eminent breeders of West Highlanders. The late Mr. Mackinnon of Corryhattan in Skye, had a large and fine breeding stock of the true Skye breed; and his stock was often resorted to as a source from which a supply of superior bulls and breeding stock could at any time be obtained, and always realised high prices. The late Mr. Macdougall of Macdougall and Lorne, and the late Captain Macdougall of Kerrera, were good breeders. Colonel Campbell of Knock in Mull has also a good stock. Colonel Maclean of Coll, Mr. Donald Campbell, late of Auchnacraig, and Mr. Stewart of Auchnashannig, all possess good stock. On the Island of Islay the Kylees are particularly large. Mr. Campbell of Islay is a great improver and breeder, and one of the most spirited and liberal landlords in Scotland. It would be well for Scotland were all landlords similarly disposed. His stock of cows is very extensive, and of a superior cast. He has sold bulls at great prices, from 100 to 200 guineas a-piece. The colours of his cattle are mostly red and dun. In this island Captain Walter Campbell of Sunderland, and Mrs. Campbell of

Balmachie, each kept about 100 breeding cows. Mr. M'Neil of Losset is also an extensive breeder. The pastures of Islay are fine, and, from its mild climate, the island is called "fertile Islay." Mr. Campbell, the proprietor of the Island of Jura, which is more barren than Islay, is an extensive breeder. He will sometimes show from 80 to 100 four-year olds at one time. On the islands of Colonsay and Oransay, lying on the north and west sides of Jura and Islay, Mr. M'Neil, the proprietor, is an extensive breeder, the most extensive, I believe, in the Western Highlands, having from 150 to 200 breeding cows, from which he shews some excellent lots of cattle. On the island of Giha, betwixt Islay and Cantire, some first-rate Kyloes were bred by Mr. M'Neil, the late proprietor, who shewed at Dumbarton fairs one of the best lots from that quarter. There are good lots bred in the small islands of Scarba, Luin, Suel, Shuna, and on the mainland in Argyll, in Cantire, Knapdale and Lorne. Mr. Malcolm of Pottaloch, in Knapdale, on the Crinan Canal, has a very superior stock. I have seen his stock of beautiful cows, above 100 in number, and also sixty three years old oxen, very fine fat, about forty-five stones each, which had been wintered on hay and grass, without turnips. They were sold at Dumbarton fair, in the June following, at 14*l* a-piece, when they had evidently lost condition during the winter. The summer grazing of the West Highlanders is much superior to their winter keeping. I have seldom seen so fine a lot as these were, in the August I saw them, when they were grazing in a grass field of about eighty acres. On this gentleman's property are 1000 acres of improved land, which must have incurred great expense to bring into cultivation. Several hundred acres had been reclaimed from the common moss, which now carry as fine pasturage as perhaps any where in Scotland. The farms and cattle in Mr. Malcolm's own hands are managed in a very superior manner. I observed a very fine lot of four years old oxen wintering in the wood of Bunaw, belonging to the Bunaw Company in Argyllshire. Frost continues but a short time, and but little snow falls in this part of the country. Rain, particularly in autumn, is the principal atmospherical infliction, and against such the shaggy coats of the Kyloes are an admirable defence. The aged cattle are almost all wintered in the fields and woods, and in January I have observed them grazing in the Island of Mull, as if it had been in summer; and what appeared extraordinary to me was to see them feeding within water mark of the tide, on sea-ware. They are extremely fond of a particular species of sea-ware, which is said to be of benefit to them in winter. The pasture on some of these islands, particularly the Strishnish Islands, is as fine as that in gentlemen's lawns around their mansions, and it continues green all the year round, the snow lying but a few hours at a time, and the temperature always favourable to vegetation. Colonel Roderick Macneil, of the Island of Barra, has long possessed, and still possesses, one of the truest bred stocks in the Western Isles.

Some fine West Highlanders may be seen about Inverary or Lochfine. The Invarary variety of Kyloes bred by the Duke of Argyll, were once famed. In Perthshire Lord Balgray has shewn some fine lots; and Lord Lynedoch has frequently shown fine lots in Perth markets from Balgowan. A friend of mine one year at Midsummer market, at Perth, bought ten such from Lord Lynedoch. They were black, with white horns, and were great beauties. After being fed the following winter, they were taken thick fat to Glasgow market, in April, when they were pronounced to be the handsomest lot of

cattle that had appeared in it for some years. Sir Neil Menzies of Castle Menzies is a spirited breeder. He obtained the Highland Society's premium, at Inverness, in 1831, for the best pair of West Highlanders. The late Mr. Donald Stewart of Auch used to show fine cattle. On the Breadalbane estate in Argyllshire, Mr. Mackay, Ardmady, has a fine stock. Adjoining Ardmady is the farm of Dignish, which was some time occupied by Mr. Colin M'Nab, and when his stock was sold off some years ago the cows fetched 20 guineas a-piece. The present tenant of Dignish, Dr. Maccallum, in 1828 sold a bull two years old to Mr. Macdonald, Fort William, for eighty guineas. On the farm of Burravourach in Glenorchy, Mr. Thomas Waters has also a good stock. Mr. Lorne Campbell, chamberlain to the Duke of Argyll, has also capital stock. Mr. David Skirving of Garleton, in East Lothian, shewed two superior dun oxen, which he had bred and fed, at the Highland Society's show in Edinburgh in 1827, and obtained the first prize for the best pair of West Highland cattle. The mothers of these oxen were two dun cows, purchased in calf, at Doune fair, by Mr. Hutcheson, at Haddington, for Mr. Skirving, from Mr. Peter M'Intyre, then in Glenartney, on the Drummond Estate, belonging to Lord Willoughby d'Eresby. Both produced bull-calves; and as they were from the stock of a first-rate breeder, they were castrated and resolved to be kept till 1827, to be shown at the Highland Society's meeting in Edinburgh; and he succeeded in his wish, thereby proving that true blood may always be relied on to produce its like. They were purchased by Mr. Thomas Taylor, flesher, in Edinburgh, along with other two crosses, for 17*l* and Mr. Taylor resold one of them to Mr. Little Gilmore, before it left the show-yard, for 50*l*. It was to be sent to Sir James Boswell of Auchinleck, on the occasion of his coming of age, to be roasted whole. Mr. Taylor slaughtered the other, and it produced seventy-four stones of beef the four quarters, and fourteen stones of tallow. The current selling prices of the best West Highlanders at Dumbarton, are from 12*l* to 14*l* for four, and from 10*l* to 11*l* for three-year olds.

One of the finest points possessed by West Highlanders is their fine coat of hair. This is an essential point for a breeder to consider. A good coat is a great safeguard to cattle twice a-year, in spring and autumn. Cattle which have been well kept during the winter, and turned out in the spring on pasture on cold bottomed land, or in cold wet clays, will assuredly be affected for some weeks after, with a catarrhal fever, if they are not protected with a good covering of hair. In like manner, a good coat is an excellent protection in nights of early frost, or rainy days in autumn. An animal with a poor coat affected under these circumstances, will cease moving about in search of food. He will stand under some sheltered spot, with his four feet drawn together, his back raised, his eyes dull, and probably watering and grinding his teeth. On the other hand, he with the shaggy coat will move about, keeping his blood in circulation, and exciting the animal heat by filling his paunch and promoting digestion, regardless alike of the rain or the hoar frost, when it drops from his sides, or sparkles on the points of his hairy covering. Improvement of the hair promotes improvement of the hides of cattle. Thin silky hair will always be found to cover a thin papery hide. Long soft mossy or downy hair springs from a thick soft hide, smooth and pleasant to the touch, like chamois leather. Such hides make the best leather for shoes and harness, and will realize the highest price in the market. This point regarding the hide is too much neglected by breeders.

The smaller sized West Highlanders are very useful to many south country farmers, who purchase them rising two and sometimes three years old, to graze on poor moor lands growing coarse grass. Many thousands of them are bought at the Falkirk trysts, and other fairs, such as Doune, Dumbarton, and All Hallow, for that purpose. Part of the grazings are left rough for them in winter; and, in severe weather, they are provided either with hay or straw on the ground, and, in some instances, turnip, with liberty to retire into shelter at night, if they choose. Where they have proper sheds to eat their turnips in, they thrive in this way most rapidly. After two winters and a summer's keep, they will attain the weight of from thirty to forty-five stones, according to age. They always meet a ready market from retail butchers, being admirably adapted to summer killing; and feeders generally contrive to have them ready to suit the warm weather. The greatest objection to these animals being at all put into a straw-yard to feed is their restless jealous disposition, which makes them too desirous to fight with or attack one another with their sharp-pointed ready-set horns. The most profitable way is to forward them on grass as much as possible, as they are most excellent grazers. The smallest sorts are called in some parts of England "bog-trotters," which will get fat on rough coarse herbage, where no other breed can. I have seen very fat lots of them fed on high coarse pastures. A lot of twenty was lately sold by Mr. Symon Hunter, of Guardmoor, one of the highest farms on the Lammernoor Hills, to Mr. John Plummer of Edinburgh, at 16*l.* a-piece.

As a striking instance of what the West Highlanders bought in this way, may attain to, I may instance the very fine dun ox shewn by Mr. Spearman of Wharton, near Rothbury, Northumberland, at the Show of the Highland Society at Kelso in 1832. This ox was bought among a large lot at Falkirk, which cost *4*l.** 8*s* each, then six quarters old. The next year he was observed to outstrip his companions in size and condition, and to encourage his natural aptitude to fatten, Mr. Spearman fed him afterwards with superior food. In 1834 he was slaughtered, and yielded the extraordinary weight of 152 stones 8 lb. the four quarters, and I believe nearly twenty stones of tallow. His price was eighty guineas.

Had the breeder of this ox been aware of its very superior properties, he would certainly never have made him an ox. The value of such an animal as a bull would have been incalculable. Mr. Spearman has frequently bought superior lots of West Highlanders, out of which he has selected particular animals, and fed them from 80 to 100 stones.

**THE AYRSHIRE BREED.**—This breed originally arose in Ayrshire, the county which gives its name to it. It is not a very old breed, but the exact period at which it was distinguished as a separate one, and by what means it was first established, is not well known. But however it originated, it is certain that it attained a high character as a breed eminently fit for dairy purposes. Indeed, it is no uncommon thing to hear it asserted that the Ayrshire cows are the best milkers in the kingdom. That this assertion is strictly true, I am inclined to doubt, but I cannot doubt that they have somehow acquired that character, and that is sufficient proof or warrant with many to furnish their dairies with them; and being thus impressed, they live happily under the idea that they possess the best class of cows for dairy purpose that can be found. A gentleman of my acquaintance once had the misfortune to excite the ire of his friend, who prided himself on his stock of

Ayrshire cows. They were certainly neat animals but small, and had, no doubt, cost him a handsome sum of money. He happened to suggest that, on his rich pastures, if milk and butter were his only objects, that a smaller number of well bred short-horn cows would yield him as much milk and butter as all his Ayrshires. He looked incredulous. It was explained to him that the larger breed would individually consume more food, and give him in return, more milk, and that he would thus incur fewer risks of death in his stock. He appeared not to be satisfied at the time with this explanation, but it nevertheless shook his faith in Ayrshire cows, and at length he tried a few short-horns, and when he found he could sell his short-horn bull-calves, and queys in calf, at large prices, and at a ready market, he fairly jilted the Ayrshires. The truth is, the Ayrshires have been too much bepraised as milkers. Let us observe the practice of those who make their livelihood by the disposal of dairy produce, and we will find that they do not prefer the Ayrshires as the most profitable milkers, but generally purchase the short-horns. The large dairies in London are almost all filled with short-horn cows, they being the favourite on account of their profitableness. In Liverpool it is the same; and the dairy farmers in Cheshire now prefer them. The large Caledonian dairy at Meadowbank, near Edinburgh, began with a stock of many kinds of milch cows, but soon found that the Tweedside short-horn cows were the most profitable. The reason for the choice is obvious. Individually the short-horn cows are much larger than the Ayrshire; they consume more food, it is true, but not more in proportion to their size; but they give more milk, take up less room, and give less trouble in proportion to the quantity of milk which they give.

The external characters of the best of the Ayrshire cattle are, a straight and nearly level back, the top of the shoulder being a little below the level line, and there is an evident tendency to depression over the loins. The ribs are pretty round, and the body deep; but there is a deficiency in the filling up of the buttocks. Viewed from before and behind, the carcass is rather narrow, particularly before; viewed from above, the shoulder is much narrower than the hocks, which gives the body a considerable wedge-shape, and the top of the shoulders a sharpness. The legs are short, and the body looks long for its height. The muzzle is fine, the face broad but rather short, the eye complacent, and the horn short and turned upwards, though not gaily. The expression of face, though gentle, is rather unmeaning. The colours are red and white like the short-horns, though not so rich, and mixed in some instances with black; but they are arranged in irregular blotches and patches, which are seldom round and never grizzled. The skin is smooth and thin, and the handling, though good, wants the mellowness which a thick soft skin possesses. The thinness of the skin, and fair handling, indicate a disposition to give milk, and a tolerable feeder. The beef is well mixed, and of good quality, but Ayrshire oxen never die well to the butchers. Few Ayrshire cattle are kept to be fed, the bull calves being fed for veal, which is excellent, and much of it reared in Strathavon, in Lanarkshire, and the quey-calves are kept to renew the cow stock. The breed, in its uses, is therefore altogether confined to the dairy. The best Ayrshires are found in the district of Cunningham.

The Highland Society's Show at Ayr last autumn (1835,) brought out a large display of Ayrshire stock. There were milch cows, queys, and young and aged

hulls. They were all in fair keeping condition; but it could not fail to strike a stranger that all their breeding animals were very small. They all bore the characters of a small dwarfy breed, wanting substance and strength. Whether the Ayrshires were ever larger I cannot say, but when the best stock of the country wanted size, it is certain that breeders must, at least at present, prefer small breeding animals. The want of size and strength are of themselves sufficient characteristics to cause strangers to doubt the great dairy powers which the Ayrshires are said to possess. For my part, after seeing them at Ayr, I was very much inclined to the opinion of them, expressed at the show, by an eminent breeder of short-horns,—“that the Ayrshire cow was only fit for cottars or moor-side farmers, and not for the large farmer.” There were but few fat Ayrshire oxen shewn; all were good beasts, but there was so much difference of symmetry and general appearance between them, that it was difficult to ascertain which was the true breed, and whether there was a dash of other blood in them. The best ox of them all, in my estimation, appeared the likeliest to a short horn. But I may mention that a large dairy farmer in Ayrshire confessed that Ayrshires were now getting too small, but that those exhibited at the Show at Ayr were not the best stock of the country.

I have heard it asserted by persons whom I otherwise considered intelligent judges of stock, that the Ayrshire cows owed their milking properties to the wedge-shape of their bodies, that is, while they are wide behind, and capacious for the formation of milk, they are narrow in the shoulder and chest. They are certainly wedge-shaped, as I have already stated; but this appears to me an extraordinary reason, at least an unsatisfactory one, that they should therefore be good milkers. That a wide hook, a broad pelvis, and deep flank are essential requisites in every good breeding cow, every one knows. This conformation is absolutely necessary for the proper enlargement of the calf, and the convenience of a large udder. This peculiar conformation is desirable for a good breeder and milker of every breed of cattle. Where there is naturally an abundance of food, an abundance of milk will naturally be looked for; and, to show that Nature is not inattentive to this relation, she produces the young large in proportion as the mother is large, in order to consume the large quantity of milk; but these circumstances have no regard to the narrowness of the chest, which confines the play of the lungs, nor with a sharp shoulder, which is only necessary to animal of speed. But as a decided proof that the milking properties of cows have no relation to the breadth of their shoulders, I need only instance the case of short-horn cows, which are capacious behind, produce large calves, yield a great quantity of milk, and yet have broad shoulders and wide chests.

But, after all, the best breed for dairy purposes must be decided, not by reasoning, nor by references, but by obtaining the great object for which it is desired—namely, profit from dairy produce. One should think that that breed which returned the largest produce for the same quantity of food would be the most profitable. Where sweet milk alone is disposed of, this criterion would be strictly applicable; but where butter is desired it might not be applicable. We have already seen that milkmen prefer short-horns, but so do the butter-makers in Cumberland; but the butter makers in Clydesdale prefer Ayrshires. But it may be desired to dispose of cheese instead of milk and butter; and for this purpose, the cheese-makers of Ayrshire prefer the Ayrshire cows; but we have seen that the cheese-

makers in Cheshire prefer short-horn cows. So that different ideas must actuate milk, butter, and cheese makers in different parts of the country. The quantity of milk said to be given by Ayrshires has certainly been exaggerated. Some writers have stated it at 2,000 Scotch pints (1,000 gallons) a-year from one cow. Perhaps a few cows might yield that quantity, but from what I have heard practical farmers say, that from 1,000 to 1,500 pints would be nearer the actual quantity. I have known many short-horn cows give twelve Scots pints (six gallons) a-day for several months in summer, and I have known of another, a cross between a Galloway cow and short-horn bull, belonging to a steward of a farm in Berwickshire, which yielded twenty pints a day during the best of the season, and she had to be milked five times a-day to keep her easy. She would regularly come at the appointed time to the gate of the field to be eased of her burden. These are remarkable instances;\* but 10 pints (5 gallons) a-day for the whole summer is no uncommon produce of milk from a short-horn cow. I am also inclined to doubt the quantity of butter which Ayrshire cows yield, as stated by some at 257 lb or at the rate of nearly 5 lb a-week all the year round. I have known of a very small Angus cow give weekly, during the best of the season, 9 lb of butter; and a calf of hers got by a short-horn bull, when a cow, yielded 12 lb of butter a-week; but these again, are rare instances. I suspect from 190 lb to 200 lb altogether in the year, or 3½ lb or 4 lb a-week, all the year round, would be much nearer the ordinary quantity, and that is a good gift.

The Ayrshire breed has spread over a large extent of country, in the counties of Ayr, Lanark, Stirling, and Renfrew, completely; and partially in Dumbartonshire and West Lothian; and, I believe, Wigton; besides being scattered in small lots over most of the lowland counties of Scotland.

THE GALLOWAY BREED.—There is no county of the name of Galloway, that being the designation of a district of country comprehending the counties of Wigton and Kircudbright. The Galloway is a polled breed, though some years ago many of them were horned; but the polled being the less likely to injure one another in the drove, the horned have been gradually wed out. Sometimes yet a small horn is exhibited, attached only to the skin. The Galloway is a symmetrical useful breed of cattle. The back is quite straight and level, at least the top of the shoulder stands more to the level than in the Angus breed. The ribs are well rounded, and the quarter is longer than in the Angus, which makes the loins short coupled. The body is deep, the brisket being well forward, and the buttocks well filled down to the hock. On being viewed before and behind, the body is broader than the Angus, the buttocks being round, the back across not flat but rounded, and the body wide across the brisket. Viewed from above, the breadth of the hocks is carried forward to the shoulders more than in the Angus. The head is rather large, and looks coarse, though it is finer set on the neck than the Angus. The muzzle is not fine, the eye dull, shewing no white, and indicating sulkiness;

\* I may mention a remarkable instance of precocity in the giving of milk, in a quey from this extraordinary milker. The quey when two years old, before it had taken the bull, or had ever seen a bull, for there was none kept on the farm it was bred, dropped an udder and gave milk. The owners thought some disease had affected the udder when they saw it enlarging, but on endeavouring to rub it and strip the teats, with a view to relieve it, pure milk came, and continued to come all summer, as abundantly as if the quey had borne a calf.

the ears thick and hairy, and the crown of the head surmounted with a large round knob, tufted with hair. The colour is mostly black, with sometimes a line of a dull dusky hue running along the back. The legs are short and strong, and few breeds carry the beef so near to the heels as the Galloway. The skin handles kindly, and is well protected with soft longish hair. The beef, when well and long fed, is of first rate quality, fetching the highest prices at Smithfield. The whole carcass shews great substance, and indeed I may say that no cattle bred in Scotland shows more substance than the Galloway's; the beef being placed mostly on the back and hind quarters, the most valuable parts of a fat ox.

The Galloway, as I have already observed, has been crossed with the Angus to improve it, and now the best Angus are as good as they; they are indeed scarcely distinguishable. It would require a very good judge of both to distinguish them. Both might, and do, mix in the same drove in England, and are sold together, and denominated Galloways. But the general run of the Galloway cattle is better than the Angus. They are more like one another, shewing a greater purity of blood, and were a single beast run off the lot, it would be a fair sample of the rest, and the sample would be a good one. The same properties could not be observed in the case of the Angus. I have also said that the Galloways are like the Buchan doddies, but they scarcely attain to the weight of them, though they are of finer quality. The former cut up beautifully with the retail butcher, the latter is better adapted for strong ship beef.

Few Galloways are fed in the land of their birth, being driven away at two and three years old, to the pastures of Norfolk and Suffolk, to be purposely fed for the Smithfield market, where they pass under the name of Norfolk Scots. From March to July fully one-third of the cattle in Smithfield are of this description. They are much liked by the London butchers, being admirably adapted for cutting up when thick fat, or "*hard fat*," a term indicative of an animal of fine quality. But I do not think that they arrive at early maturity, as they do not get ripe till four years old, except when extra fed.

The best queys in Galloway are kept for breeding cows, the rest are spayed, and sent along in droves with the stots. The spaying used to be delayed till the queys were a year old, but now it is generally performed a few months after their being calved. These spayed heifers never attain to the size of the stots, but, like all heifers come earlier to maturity, and produce beef of the very finest quality. The Galloways not only occupy Galloway proper, but the southern portion of Ayrshire, and a considerable part of Dumfriesshire. As I have already remarked, they have been taken to Forfarshire to improve the Angus breed, but few of them are now to be found in that county in a pure state. Galloways are kept in a pure state in Sutherlandshire, by Mr. Alexander Craig of Kirton, near Golspie, on that tract of land lying between the Little Ferry and Golspie, which has been lately so much improved by Mr. Craig, Mr. Sellers, and others. Some years ago Mr. Craig got a few cows and two bulls from Galloway, which he has since increased to a stock of from fifty to sixty breeding cows, which I have seen, and I must say that I never saw a lot of Scottish cows, which I admired more. They are very like one another, and showed excellent symmetry, and some fine points. I saw them in August, when they were in high condition, almost fit for the butcher. They were stated to be fair milkers. They seemed suitable to that part of the country, and they inspired their proprietor with confidence in the breed. I recollect of Mr. Craig

selling a lot of three-year-old Galloways, to Mr. Brown of Linkwood, a distiller near Elgin, for 11*l* a-piece, the price of cattle being low at the time. They were fed on distillery offal to April, when Mr. Brown was bid only 14*l* a-piece for them. He preferred driving them to Aberdeen, and sending them on consignment by Steam to a Smithfield salesman, who obtained 19*l* a-piece for them. After deducting 3*l* a-head of expenses, he still got 2*l* a-head more than he was offered at home. But, it may be observed, that Mr. Brown being a malt distiller, the offal was much inferior to the offal of raw grain. Mr. Craig showed some of his Galloway stock at the Highland Society's Show at Inverness in 1831, which were much admired, and gained a premium. A few of the three-year-olds were purchased by Mr. Dalgairns of Ingliston, in Forfarshire, for about 21*l* each, and were afterwards sold by him in January 1832, in Glasgow market, for 25 guineas a-piece. They were very superior oxen, and supposed to weigh fully 70 stones each.

These which I have now but shortly noticed, comprehend all the principal breeds of cattle in Scotland. As my intention was only to describe Scottish cattle, I shall not attempt a minute description of those in England, particularly as there are many there whose characters I have never had a proper opportunity of studying. My determination is to say nothing of live stock at all but what I know from my own observation and experience; and as long as I adhere to this rule, there can be "no mistake." But as the largest portion of our Scotch cattle go to England, it may be interesting to know in what parts of England they are chiefly to be found; and as many cattle from Ireland now find their way to this country, and as I have seen a considerable number of all kinds in Ireland, a few words upon their characters may not be irrelevant.

The short-horns have spread themselves over the counties of Northumberland, Durham, Westmoreland, York, and Northampton. They have partially obtained footing in Cumberland, Cheshire, Lincolnshire, Norfolk, and Suffolk, and in several of the midland counties. Numbers of them are sent from Lincolnshire, under the name of "Lincolns," to the London market. They had been purchased in the northern counties, and fed off on the deep moist pastures in that county, where they attain to great size and heavy weights. The dairies in all the largest towns in England are supplied with short-horn cows, as being the steadiest milkers, and afterwards the best feeders, of any breed. The Galloways, Angus and Buchan doddies, find their way in droves to Norfolk and Suffolk, where they are fattened for the London market. They are much admired, and fetch the highest prices. The North Highlanders occupy the coarse and upland pastures in the elevated lands through the middle of England, Northumberland, and Yorkshire; and many pass into Wales. And the West Highlanders are to be found grazing in the low pastures of the midland counties, particularly Leicestershire, as far as the neighbourhood of London, and to the east and west of that line in most of the lowland pastures. They are great favourites in the country markets in England, and, along with the North Highlanders, make excellent cutters up for summer killing. Such is the dispersion in England of the different breeds raised in Scotland.

ENGLISH BREEDS.—In regard to the breeds peculiar to England which I have seen, I admire the Herefords the most, because they show when fat, symmetry and points the nearest in resemblance to those of the short-horns. Their colour is red, with

almost always much white in their faces, and some are white backed. Their horns are white, and longer than the short-horns. They carry the beef well on the back, and although a heavy breed, they generally sell at the top price at Smithfield. I have seen some beautiful lots of them shown there about Christmas. The Hereford cow, being, however, a very bad milker, and the calf consuming all the milk, this breed of oxen must be less profitable to the breeder than the short-horns. The Herefords pay the feeder better than the breeder.

The long-horns occupy several of the midland counties of England, particularly in Lancashire. They are mostly of a dark red colour and brindled, with white along the back, and long, spreading, and sometimes drooping horns. They have good coats of hair, fair symmetry, having the back well covered with beef, and get to great weights; but they are rather coarse in the bone. They are good grazers and pretty well liked by feeders, but still the Scotch cattle are preferable as grazers. The late Mr. Bakewell cherished the long-horns in preference to all others, and maintained their superiority; but experience now generally awards the palm of merit to the short-horns.

The Sussex cattle are a large breed, generally of a red colour, with no white upon the face, but having larger horns, plainer skins, larger bone, and being deficient in symmetry, points and quality, when compared with the Herefords. They are well adapted for the shipping line, and are frequently bought by the shipping butchers, while the Herefords are purchased by the cutting up butchers, who always give the highest price for the best quality.

The Devons have a pure rich red colour, with white horns. They possess fair symmetry and points, and, consequently, are of middling quality; but not equal to the Herefords as cutters up. Some of them have been tried in Scotland, but they do not seem to take in that country. I have seen them grazed along with short-horns, and had no chance with them as feeders. I have also seen them killed; they are fleshy, but want that fine mixing so common in Scottish cattle and short-horns. They are prized in some parts of England, as in Devonshire and Norfolk, for yielding richness and quantity of butter. It is certain that very little agitation causes the cream to pass into the state of butter. Lord Lynedoch imported a large lot of North Devon cows from Mr. Coke of Norfolk a few years ago. Some of them, on being exposed to sale, found no purchasers. Devons are also favourites in some parts of England for the draught. They have been tried in Ireland, particularly in the county of Mayo, where several breeding stocks are kept. There they are small but the beef is better than that of the native Irish cattle. They have probably been imported from North Devon.

The Suffolk cattle are all dun coloured, and they very nearly resemble the Angus in external characters. The cows are said to be greater milkers than the Angus, but no wonder when one observes the superior pastures of Suffolk. Very few oxen of the duns are fed fat, the bull calves being fed for veal, and the cows purposely kept for making butter for the London market: hence the proverbial poverty of the Suffolk cheese.

The Welsh cattle resemble the smallest and coarsest sorts of our Fife and Aberdeenshire runts, having thick horns, thick coarse plain hides, and narrow backs, and, in my opinion, they are a very inferior breed of cattle. This is the description of many which I have seen fat at Smithfield, and lean at Epping Forest and Rumford markets. They appeared,

however, very like one another, which is a proof that no intermixture of blood exists in them. But graziers and feeders out of Wales (for in that country the prejudice in favour of their own cattle exists in a very strong degree,) who can find Scottish West Highland cattle, never think of buying Welsh. The agriculture of Wales being far behind most parts of the kingdom, inferior cattle may be expected to accompany inferior husbandry.

IRISH BREEDS.—The native breeds of Ireland deserve a separate notice. There are apparently three breeds of cattle in Ireland: one inhabiting the mountainous parts, and being of small size, and commonly called the Kerry breed; another, a small but larger breed than the former, to be found chiefly in the north of the island; and the third is to be found in the low rich plains in most of the midland and southern counties. The two last are evidently both long-horns, but they do not appear to have had a common origin.

The Kerry breed is as small, and not unlike the Skibos of Ross-shire. They have small bone, sharp muzzle, quick piercing eyes, long sharp pointed horns turned upwards gaily at the points, fine hairy coats, and are as wild as hares. When let alone they are quiet enough, but if the least irritated or raised no fence can contain them. They are great milkers for their size, and on that account the heifers are in constant demand, fetch good prices, and make a good poor man's cow. In this latter respect they are like the Ayrshire cows. Drovers of Kerry heifers may be met with in many parts of the low country, ready to be disposed of in lots of one or two to small farmers and families in towns who keep cows.

The cattle in the north of Ireland are a shapeless inferior sort. A few of a symmetrical shape may be occasionally seen, but the generality of them are certainly worthless, and I should conceive dull feeders. They have large heads, long horns, coarse bone, coarse thick hides, of every variety of colour, but mostly white on the back, with dewlaps, and the body is quite thin when viewed before or behind. Large droves of them, three and four years old, are weekly exported to Liverpool, as grazers in England, of the value of 5*l* a-piece. I was informed by the owner of a steam packet at Warrenpoint near Newry, that eight hundred head of them per week, for sixteen weeks, had been shipped from that port to Liverpool alone. The freight was 15*s* a-piece. Many of the heifers are in calf, and frequently bring forth their young on board ship, so ignorant are dealers of their existent condition, and so careless are the breeders of the promiscuous intercourse between the sexes.

The breed of the plains, with long horns, is a large and valuable breed. They have straight level backs, strong bone, thick and rather hard hides with plenty of hair, placid eye and countenance, great substance with thick shoulders, short coupling, and backs well covered with beef. Their colours are various, mostly red and white, coarse ugly roaned, with white along the back. When fat they are much liked by the shipping butchers. Liverpool and Manchester fat markets are almost wholly supplied with them; but the finest description of them are to be seen in Smithfield market, Dublin. The quality of the meat is middling, strong in grain, but juicy, and the flavour is always pleasing. As grazers in England, they are never preferred to the Scottish cattle, but in their own deep land pastures and moist climate they feed very quickly. It is perhaps owing to fast feeding that the grain of the flesh is larger, and it is this property which makes the meat take so well at Liverpool for the shipping. Many are also

sent fat to the Glasgow market, where the heavy parts, such as shoulders and rounds, are salted for hams, that city having long been famed for beef-hams. The hides of these cattle, on account of their thickness, give 10s to 20s a-piece more than the hides of short-horns of the same weight. Upon the whole, they are a useful breed of cattle, but they have not the fine quality of the Scottish Galloways or West Highlanders, which take so readily in London. But the Irish cattle can be brought to great weights. I saw a lot in Dublin market of five-year olds, which were estimated to weigh 110 stones each, and were sold for 32l a-piece.

I consider the price of cattle fully as dear in Dublin as on the borders of England and Scotland. A lot of cross heifers, of about forty stones each, sold for 12l 10s each, and at the time they would not have brought the same money in Edinburgh or Morpeth. The best beef in either of these markets did not exceed 6s or 6s 3d the imperial stone, that being in the beginning of April. At that time the grass was so fine round about Dublin, that I saw a large lot of cattle grazing in the Phoenix Park. On returning to Scotland a few days afterwards, there were few symptoms of vegetation. But indeed, throughout the whole midland and southern counties of Ireland, such as Meath, East Meath, Tipperary, Kilkenny, Carlow, Limerick, Leitrim, Roscommon, and other counties, the pasture to Scottish eyes is indescribably good. I have often thought, and not without a feeling of envy, that were such pasture in Scotland, or were Scottish farmers and their stock in Ireland, what a mine of wealth might not that country become to the whole kingdom! But it is impious to indulge in impossible wishes.

The Irish beef being strong in the grain, stands the salt, and is therefore well adapted for the supply of the navy. During the war, salting of Irish beef was carried on to a very great extent. Much chicanery, it is true, was practised by the contractors for beef upon the feeders of cattle, who were principally the small farmers, and it was lamentable to hear how they were duped and cheated; yet a similar disposition is frequently shown by the latter, under unprovoked circumstances, to poor labourers who were under their power, that our pity for them strengthens into a satisfaction that they had received retributive justice from superior hands. Such is the prevailing desire to over-reach one another among the lower orders in Ireland, that until their moral habits are raised to a higher degree, no peace can be ensured, and no confidence established, in that country. Many of the most fearful contentions amongst families have entirely been engendered by moral turpitude.

**ISLE OF MAN BREED.**—The cattle from the Isle of Man might be expected to be a sort of distinct breed, because we frequently find that where little intercourse takes place between an island with the main land, the cattle on it naturally assume the characters of a distinct breed. They become like one another, and show that they have had a common origin, like the West Highlanders in the Isle of Skye, formerly alluded to. With these ideas in my mind, I was anxious to see the cattle of the Isle of Man, but what was my astonishment when I beheld in them the most mixed breeds I ever saw, particularly in a cargo which arrived in Liverpool as I was one day waiting at the Brunswick Docks the arrival of a vessel with cattle from Ireland. They beggar description. I was impressed on seeing them that the worst cattle of all breeds and colours and shapes had been collected together. There was not one good beast amongst them. To satisfy my curiosity about the value of them, I asked the price at the owner;

he answered, 8l a-piece. I should have thought them dear at 5l, although they were all above three years old.

**ALDERNEY AND JERSEY BREEDS.**—A few cows of the Alderney and Jersey breeds are to be seen in Scotland, kept as dairy cattle for supplying butter to gentlemen's tables. Their milk is certainly very rich, and the butter is equally so; but the cows are not adapted, in my opinion, to this climate. They are mostly of a light brownish-red colour, mixed sometimes with white, and sometimes with dun and white, with short horns, and have a timid cast of countenance. Their hair is short and smooth, and the skin very thin and papery. When viewed from behind, their body appears like two boards nailed together, "as thin as a lath."

**FRENCH BREEDS.**—I have seen some French cattle. They are not unlike the Guernsey breed. They are ill made, but give excellent milk, and get very fat on the rumps, but they are always thin on the ribs, and the beef is generally of a yellow hue.

**AGRICULTURAL PETITIONS.**—Mr. Editor, —The farmers have, as in duty bound, stated their distress to the legislature. Last week Sir Robert Peel remarked, that the Committee might perhaps make a Report at the end of the Session, but it would be merely a report. I hope, therefore, none of my brother farmers are looking for help to that quarter. Deceived as we were by our representatives, on the malt tax question, we have now only to look for safety, in the reduction of rents and expences. Rents must come down; wheelwrights, blacksmiths, and harness makers bills, must be reduced to the Peace prices, and all trades must moderate their charges. With bread at five pence the loaf, and meat at sixpence a pound, and all articles of life, cheap in proportion, we may manage to live if our landlords stand by us. Therefore let all be exhorted to look no more to Parliament. AGRESTIS.

**AGRICULTURAL STOCK.**—Last week the sale of the cattle, &c. of Mr. Trench, of Bromfield, in this county, took place, and it has not surprised us that extraordinary prices were obtained for many animals, because for more than 20 years Mr. Trench has been a pre-eminent breeder and farmer. One cow and calf sold for 60l 10s; a three-year old heifer in calf, 52l; a three year old heifer in-calf 40l; two-years old heifers, 30l 10s, and 29l each; yearling heifers, 20l each; two-year old bullocks, per pair 42l 10s. The bullocks, of their age, were acknowledged to be the best ever seen by the company present. Yearling bullocks 19l per pair; a two-year old bull sold for 90l, and a yearling ditto for 80l. The Southdown ewes averaged nearly 40s each; not more than market price. One ram sold for 40l 10s. During the sale, it was generally remarked by the company that they never witnessed a more respectable attendance, comprising 400 to 500 agriculturists:—among others was the Earl of Lisburne, who was a considerable purchaser; Thos. Andrew Knight, Esq., was also present, and many of the gentry in the neighbourhood. The two-year old bull was purchased by W. Oakley, Esq., of Oakley, near Bishop's Castle; and we doubt whether a landlord could better assist his tenantry than by thus enabling them to improve the quality and symmetry of their cattle. The result of the sale, and the warm and generous feeling evinced towards Mr. Trench, must be highly gratifying to him. Much regret was expressed that a gentleman who had lived upon a farm 39 years, has at last resolved to quit it; and the most ardent wishes for his prolonged health and activity were expressed again and again. Broome, the auctioneer, was in his glory at such a sale. He expects old times to return; but farmers must not be misled by the sale and dispersion of this extraordinary stock.—*Shrewsbury Chronicle.*

## PALSY IN SHEEP.

(From the Veterinarian.)

Palsy is not of so frequent occurrence in sheep, as in oxen; for in their general management they are more exposed to the vicissitudes of the seasons, and hardened against the influence of sudden atmospheric changes. Nature has also given to them, for their own benefit and for ours, a thick coat of wool, which, under ordinary circumstances, may bid defiance both to cold and wet: yet there are times when they seriously and fatally experience the benumbing power of the former.

The ewe at yearning time, enfeebled by the process of parturition, more than usually susceptible of impression from external agents, and less able to struggle against those which are injurious, is carelessly left in a bleak and exposed situation: at night comes "a frost, a killing frost," and, as the shepherd with true pathology calls it, "she is chilled, chilled to the very marrow."

The lamb, just dropped, is perhaps naturally weakly, or, if strong, yet suddenly changes the temperature of the mother's womb for one perhaps below the freezing point, and lies for hours on a bed of snow. True—nature has kindly given to these little ones, and to young animals of every class, a power of resistance against the cold—a degree of insusceptibility to its benumbing influence—but the vital power must necessarily sink under an attack like this. The farmer carelessly examines his flock at night, but thinks not of the bitter biting blast to which they will be exposed; and in the morning he finds many of them dead, and more deprived of all power of motion.

THE PROCESS OF MISCHIEF.—The heat is rapidly abstracted from these neglected and abused animals by the cold bed on which they lie, and the cold air around them. It is abstracted far more rapidly than it can be supplied, and the general sensibility, and every vital manifestation, is diminished, and becomes inactive; the power of voluntary motion is suspended—the nervous influence of the organic system is withdrawn—the vital current is arrested, and life is fled. One universal palsy leads on to, or is another word for death\*. If the full depress-

\* Some of the most appalling accounts on record of the rigidity suddenly produced by excessive cold, are contained in Labaume's history of the disastrous campaign in Russia, translated some twenty years ago by the author of these lectures, in order to wile away a few idle hours.

The French army was retreating from Viasma "suffering yet more from the cold than from hunger. They abandoned their ranks to warm themselves by a fire hastily kindled; but when they would rise to depart, their frost-bitten limbs refused their office, and a partial insensibility crept over them. We heard some of them faintly bidding their last adieus to their friends and comrades—others, as they drew their last breath, pronounced the names of their mothers, their wives, their native country, which they were never more to see. The rigour of the frost soon seized their benumbed limbs, and penetrated through their whole frame. Stretched on the road, we could distinguish only the heaps of snow that covered them, and which at almost every step formed little undulations like so many graves."

They at length approached the Niemen. "Some had lost their hearing, others their speech, and many were reduced by excessive cold and hunger to a state of frantic stupidity. Some were so weak, that, unable to lift a piece of wood or roll a stone towards

ing effect of surrounding cold is not produced, yet the energy of the nervous system has been so fearfully impaired, that the stimulus, and the power of being acted upon, whether with reference to animal or organic life, are for awhile suspended; and if indeed they ever return, they return slowly, and with considerably diminished energy. For many an hour, and often during many a day, the blood loiters, and the muscles are rigid, or their contractions are in a manner powerless; and there follows a compound of rheumatism and of palsy—the last predominant and most obstinate. After all, the animal rarely regains its former condition and value, but continues a mortifying and disgraceful exhibition of the carelessness and inhumanity of the farmer. How much has he yet to learn with regard to the treatment of the lamb and its mother! In some seasons the mortality among these animals forms no inconsiderable item in the catalogue of his losses, and the circumstances which contribute to general agricultural distress.

Mr. Garland, in the first volume of "The Veterinarian," describes this infantile palsy, if I may so call it, in the lamb. He says that "three lambs were dropped on the 23d of March, without any assistance. In each there was a complete loss of motion on the left side. They lay quietly on the affected side, but when lifted up, and thrown on the opposite side, their struggles were incessant." This hemiplegia in the lamb, while we have little or nothing of it in the horse or the ox, is a circumstance for which I confess that I am unable perfectly to account. One thing, however, we know, that the sheep has hyatids in the brain far oftener than any other domesticated animal. A disposition to the generation or shelter of this parasite in the cranial cavity, is one of the pests of the sheep. Were there congenital hyatids here?

LESSON TO THE FARMER.—In the beginning of the lambing great numbers of these animals die from cold. A warm thick hedge towards the north, or a temporary shed of hurdles or of faggots, however rudely constructed, and ultimately costing little, would have afforded almost all the shelter which was required. Well! the farmer feels the consequences of his folly and inhumanity. His expected flock of lambs has been materially diminished, and he determines to make the most of what remains; but with consistent want of thought or calculation of consequences, he again goes the wrong way to work, and he kills them with kindness: for, scarcely recovered from their former debilitated state, he now puts them where there is the best flush of grass, and he decimates them by inflammation.

ADVICE TO THE VETERINARIAN.—When, gentlemen, you begin to be consulted, as you will ere long, with respect to the diseases and the general management of all domesticated animals, your inquiries into the nature and causes of disease will enable you to give your employer many a valuable hint, and, by diminishing the casualties to which his live stock is exposed, you will materially lessen the aggregate of distress.

TREATMENT.—Well, gentlemen, there is a little art in treating these poor palsied beings, and especially the young ones; for although they resist the cold longer than the adult animal, yet they have not

the fires which they had kindled, they sat upon the dead bodies of their comrades, and with a baggard countenance stedfastly gazed upon the burning coals. No sooner was the fire extinguished, than these living spectres, no longer possessing the power to rise, fell by the side of those on whom they had sat."

strength to bear the re-action which follows when the vital heat once more begins to be produced. The means of relief are simple, but should be cautiously applied. The little patient may be put into a hamper, and carried home, wrapped up in straw, and thus the little portion of warmth which yet continues to be eliminated will not be dispersed. After awhile he may be brought, but very cautiously, into a warm room, or placed at some distance from the fire: a little warm gruel may be administered, with a small quantity of ginger; or, if he does not soon begin to rally, a little ale may be added to the gruel. I would hardly allow any thing stronger. Mr. Garland recommended that his patients should be bathed in warm water for a quarter of an hour every day. "This," he says, "was of considerable benefit, and in a few weeks they were enabled to stand; but when we ceased to bathe them, they became rapidly worse than before, and were killed." Moderate warmth is the principal restorative; but as soon as the lamb begins to recover, and is able to toddle a little about, he should be returned to his mother, who has, in the mean time, been removed to a more comfortable place, and her care of him and her milk will gradually accomplish a cure.

**DIARRHŒA.**—The organic system, however, does not appear so soon and so perfectly to rally as that of voluntary motion. The limbs lose their rigidity, but the digestive organs imperfectly discharge their functions. The frequent, or, to a certain extent, the almost invariable consequence of this exhaustion, is diarrhœa, difficult to arrest, and soon assuming a serious character. The best, and indeed the only, safe and efficacious remedy that I know, is that which, differently prepared by different persons, goes under the name of "the sheep and calves' cordial." It is composed of prepared chalk as an antacid, the acescent principle often sadly prevailing in these patients, and at this time; catechu, as an astringent: ginger, as the very best stomachic and tonic that we have—a tonic because a stomachic; opium in the form of laudanum, allaying the irritability of the exhalent vessels, and the inflammation of the mucous membrane of the intestinal canal; and peppermint water as a menstruum, a vehicle, and yet, by its stimulant and tonic power, preventing the formation or assisting in the expulsion of those gases, which in every derangement of the digestive organs are so annoying and dangerously extricated in the stomachs of ruminants. The proportions of the ingredients would probably be one pound of the prepared chalk, half a pound of powdered catechu, four ounces of powdered ginger, and a pint each of the laudanum and peppermint water.

**PALSY AT WEANING-TIME.**—Two or three months afterwards comes another dangerous season as it regards the lambs—the time of weaning, and especially if the weather should be cold. They are then often turned into some distant and, perhaps, upland pasture, that the mother and the young ones may be out of the hearing of each others bleating; and that the food may not be too plentiful or stimulating until the lamb is somewhat accustomed to his new kind of nourishment. Notwithstanding every precaution, however, purging will come on, and cold will be taken, and there will be weakness of the limbs generally, and especially of the hind limbs, and an approach, at least, to palsy. Possibly this may be somewhat connected with the state almost of abandonment in which they were left when newly dropped. There remained a certain debility, or possibly predisposition, to palsy. Mr. Garland says that, when other lambs of the flock to which he referred became two months old, they were attacked by a

similar affection. The treatment will be simple. If the weather or the locality demands it, the animal should be placed in a more comfortable situation; a purgative, consisting of Epsom salts with ginger, should be administered; and then a dose or two of the "cordial" will usually set all right.

**CAUTION.**—The palsied ewe at weaning, or the palsied lamb at weaning-time, should undergo no protracted course of treatment, especially if they are in tolerable condition. The result of the treatment is not always certain; there may be considerable deterioration of value, or, after all, the patient may be lost. Therefore, if immediate success does not attend your remedial measures, honesty to your employers will suggest the hint that the animal may with most advantage to the owner be sent at once to its destined place.

**THWARTER-ILL OR SHAKING.**—There used to be a singular cerebral or spinal affection among one or two-shear sheep, which fortunately has, in a manner, disappeared in our country. It was called, I know not why, *thwarter-ill*. In some districts it was more appropriately named *trembling* or *shaking*. There was a peculiar uncertainty in the gait and walk of the animal, every limb seeming to give way; and this gradually degenerated into *shaking palsy*. The patient at length fell, and could with difficulty rise again.

**THE LEAPING-ILL.**—From the apparent eccentricity of motion in some cases, it was called the *leaping-ill*. The sheep would neglect their food, stand still, stare stupidly around them, and then all at once leap up as if to clear some hedge or ditch. The neck would often become stiffened, and turned on one side. The animal would become weaker and weaker. The use of its limbs, and particularly of its hind limbs, would gradually be lost, and, at length, it would fall to rise no more; yet even as it lay it would occasionally abandon itself to the most singular contortions. Then would come some moments of remission, and the poor animal will set to work and eat every thing within its reach; and many a day, and occasionally some weeks, would pass (if the owner was brute enough to let them), the palsy becoming more confirmed, the animal wasting every day, but the appetite remaining unimpaired.

**LOCALITY, CAUSES, AND TREATMENT.**—This disease was usually confined to poor and overstocked farms, and was most frequent in March and April, when the winter's food was gone, and that of the spring had not sufficiently grown. It was often sudden in its attack, like all other species of palsy. After an unusually cold night several of the sheep would be found in the morning trembling, or down and unable to rise. Some would fall, and die in a few minutes. Others would drop, and lie many hours or days shivering or struggling. In some it would appear in the form of, or soon become, palsy of the hind legs; in more, one side only would be attacked, and others would be lame in one leg only. It seldom attacked sheep in good condition, but the weak and half-starved ones were its principal victims. Warmth, bleeding, and physis, were the only remedies, but in most cases the evil was past all cure.

**HOGG'S DESCRIPTION OF IT.**—The Ettrick Shepherd gives the best account of it. He says that fifty years ago its ravages were so considerable that the farmer believed the disease to be infectious, as well as hereditary; and that it was as unsafe to buy from a stock in which the thwarter-ill had appeared, as from one that was liable to the rot. Mr. Lawrence, quoting from Lisle, says, "some years the sheep will be apt to be taken with the disease they call the *shaking*; some farms are more subject to it than others: it is

a weakness which seizes their hinder quarters so that they cannot rise up when they are down. I know no cure for it. Some years a hundred of a flock have died of it."

**VARIETY OF THE DISEASE.**—A very similar complaint used to be prevalent, and is still observed, on several parts of Salisbury Plain. From an unusual coldness of the season, or on certain exposed and bleak situations, or from starvation, or neglect of various kinds, an endemic or epidemic disease breaks out. It commences with slight staggering; a certain degree of stupidity; a gradual wasting; a weakness of the loins; the animal continually slipping and falling; dragging his hind legs behind him more or less; one leg evidently more affected than the other; occasional grinding of the teeth; the appetite unaffected; diarrhoea; death. The post-mortem examination presenting usually softening of the spinal marrow in some part of it, and mostly about the lumbar region; but not infrequently hydatids in the brain, sometimes one or two considerable ones, at other times groups or bunches of them in the ventricles, or in the scissure between the lobes.

**CONNECTED WITH HYDATIDS.**—I confess that I am much disposed to attribute these cases of real or spurious palsy to pressure on the brain by hydatids; and those hydatids, if not owing their existence, yet the suitability of their locality, to damp and unhealthy pastures, neglect, starvation, or hereditary predisposition. I have treated of this at length when speaking of the hydatid in the brain of sheep; and while we must not abandon the individual cases that come under our notice, we must find our hope of eradicating the disease from the farm or the district on the adoption of a more rational, and humane, and profitable way of managing our sheep.

**CONNECTED WITH CUTANEOUS DISEASE.**—Girard speaks of palsy as very common among the sheep in various departments of France, and in Germany; but he connects it with other complaints—the sheep-pox, of which fortunately we know but little in England, and the scab, of which we occasionally see too much. He describes it as preceded by intolerable itching. The animal violently rubs himself against every object with which he can possibly come in contact. He works himself into a perfect rage and fever; he stands and shivers from head to foot, and sometimes falls into an epileptic fit, but of no great violence or lengthened duration. This pruritus commences about the tail and the croup; it rapidly spreads over the loins and the back, it extends to the head, and reaches to the very feet. He bites himself, he tears away the wool, he abandons himself to every kind of violence. By and bye his intellect is evidently affected—he has a wild and wandering look, and the slightest disturbance frightens him beyond measure. He strays hither and thither; he stops every moment in order to bite or rub himself; his walk is vacillating, staggering; the uncertainty of gait is sometimes referable to the four extremities, sometimes to the hind ones, and, at other times, both are affected. Every motion is attended by an increasing degree of uncertainty. He falls on his knees; he falls completely down, and remains a considerable time before he is able to rise; at length he falls to rise no more, but even then he seeks for something to eat, and, if it is brought, he will live in this miserable state eight or ten days.

**PATHOLOGICAL EXPLANATION.**—How shall we account for the paralytic state of the patient, which forms the closing scene of this sad disease? Is the nervous system completely exhausted by the long continuance of intolerable irritation? I can readily

conceive of the spinal cord and its membranes sharing in this intense inflammation, spreads everywhere around them, and invading every part to which the nervous fibrils are sent. I can conceive this ultimate exhaustion of sensorial power to be the natural or necessary consequence of cutaneous, and, perhaps, deeper seated erythism like this.

**THE REPELLING OF CUTANEOUS ERUPTIONS.**—Among the causes of palsy in the human being is the sudden repelling of extensive or acute cutaneous eruptions. We have occasional elucidations of this in our country. There is no more effectual remedy for the scab in sheep than the mercurial ointment: I was going to say that there is no other remedy on which dependence can be placed. It needs not, however, to be used in the concentrated state in which it is generally applied. It needs not to be the strong mercurial ointment of the Pharmacopœia. Mixed with four or six times its weight of lard, it may not relieve the disease so speedily as in its concentrated state, but it will do so more perfectly and more safely. I have known many instances of ptyalism and nervous affection from the undue use of mercury, and more especially from that of arsenic. The French, however, pay little attention to this, and when palsy eventually occurs, they attribute it to the cutaneous eruption, and not to the remedy. They consider the eruption as the first stage of or preparatory to the appearance of palsy, and they bleed and physic, and use turpentine embrocation on the spine.

**STRANGE GERMAN OPERATION.**—The Germans have somewhat of the same notion, and they resort to a very singular and cruel method of cure. They judge, and perhaps rightly, that this is a disease not simply of the integument, but that the subcutaneous cellular tissue is, if not essentially, yet speedily involved. They make an incision into the skin of the back at the posterior region, and introduce into it a canula; and then, by hard blowing and some manipulation, they separate the skin from the subjacent tissue, and then inject oil of turpentine. They excite speedy inflammation, and enough of it too; and the affection of the integument is relieved or disappears, and the spine never becomes affected. This seems a butcher-like way of proceeding, and I do not think will be speedily adopted in our country; but we may perhaps derive from it a useful hint with regard to the application of stimulants in some cases of scab (for there are several distinct kinds of it), and also the possible efficacy of blisters along the spine in cases of palsy of this patient: I acknowledge, however, that I should not expect much benefit from them, for I should rarely, if ever, be able to produce vesication.

**OUR PAIN.**—On the whole, our efforts must be directed to the prevention of this spinal affection: our prognosis should always be very guarded, or distinctly unfavourable, and our advice should usually be to cut that short which we may probably be unable to cure.

**DESIDERATUM.**—Here again we sadly need—the sheepmaster and the country demand—the establishment of experimental schools. Until we have them, we shall know little of the cause and the treatment of many a disease of cattle and of sheep, for we have no right to sacrifice the property of our employers, nor are we called upon seriously and inconveniently to sacrifice our own.

**AMERICAN CHEESE.**—We observe, from the American papers, that there was presented, on the 1st of January last, to Mr. Jackson, President of the United States, by a Mr. Thomas S. Meachan, of Washington, a cheese weighing no less than *fourteen hundred pounds!*

## ENGLISH AND RUSSIAN TALLOW.

(From the Portfolio.—Ridgway.)

At a time when there is so much disposition shewn by the legislature and the community at large, to devise some measure of relief for the Agriculturists, without injuring the commercial operations on which the prosperity of the nation, and, consequently, of the agriculturists themselves, immediately depends, we are surprised that attention has not been directed to the agricultural produce imported either at a low rate, or duty free, from countries which tax, or wholly exclude our manufactures, which they are only encouraged to do, by our free admission of their produce to compete with our's, while they refuse the corresponding facility to our manufactures.

The rate of and mode of levying duty on tallow and soap, is at present most injurious—an expensive and cumbersome, and withal inefficient organization for collecting the excise duty on soap, injures that manufacture by its regulations, while it diminishes the revenue by its costliness. The export commerce of soap is arrested—the home consumption is restricted; tallow from Russia competes with our home supply, or at all events by its comparative cheapness allows Russia to increase its price by various modes before it is exported. The repeal then of the excise duty on soap, and the substitution in its stead of a heavier duty on tallow, would greatly improve the soap manufacture, afford a temporary advantage *directly* to the agriculturists, and if in the long run the price fall even lower than it is at present, which it is to be hoped it will, still the home grower would occupy a relatively superior position. If such a measure were adopted, we see other great political and commercial consequences which indeed are our inducements for entering into the subject, namely, the blow that thus will be struck at the *political projects* of Russia, and the new commercial field that will be opened by the simultaneous reduction of the duty on oil—these questions we have already treated and will return to again, for the present we will address ourselves to the specific proposition which we now put forward, which is, to impose a higher duty on foreign tallow, and to do away with the excise duty on soap if possible.

1st. The inevitable effect will be to enable the cattle-feeder to have a higher price for his cattle, as the quality of home-fed tallow is much superior to foreign, and the price of the former is only kept down by the great importation of the latter, which is used to mix with our own tallow.

2nd. As soap and candles are articles which form large items in the expenditure of all classes, it would be advantageous to have them made as cheap as possible; and they will certainly be cheaper if the whole duty were placed on tallow, because the expense of collecting any excise duty is much heavier than a customs one; and the various restrictions necessary for the former, renders the soap-maker's process much more expensive than it would otherwise be.

3rd. The increased cost occasioned, as we thus shew, is an immense barrier to an increase of export of soap and candles, which might (if the duty on them were lower) extend to five times the present amount, for, in consequence of our high prices of these articles, France supplies nearly the whole coasts of the Mediterranean and a great portion of America. This is a question of first-rate importance in a commercial point of view.

4th. The removal of all duty on soap, will form a saving to the country in the collection of revenue, equal to about 50,000*l.*, being the expense of collecting the soap duty.

5th. The increase of duty on tallow, will, no doubt, drive soap-makers to find other oleaginous substances as substitutes, as soon as our own produce of tallow is not sufficient; and in this search they will encourage the importation of cocoa-nut-oil from our own colonies, of palm-oil, and olive-oil, from countries which take payment entirely in our own manufactures, while Russia, from whence we draw all our foreign tallow, takes only a proportion of the value of it in our manufactures, and those the least profitable to us:—even this branch of export to Russia, is gradually decreasing.

The objections that are generally urged against any increase of duty on tallow, are—

1st. That it will prevent the importation of foreign tallow altogether, and thus raise the price of soap and candles.

2nd. That it will thereby curtail Russia's ability to take manufactures from us, as she depends on her tallow for payment to us.

3rd. That any increase of duty, to the extent we advocate, would be a total reversal of the principles of free trade, which our present, and many past governments have held out to foreign nations as the main feature of British commercial policy.
